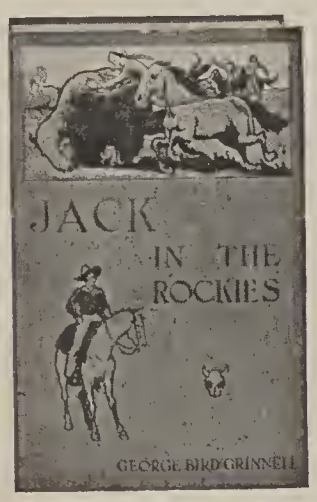
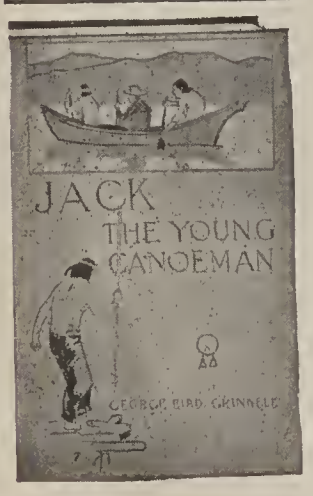
THE JACK SERIES

Best Books For Boys

By GEORGE BIRD GRINNELL





THE solution of the parents' problem of providing for the growing boy reading at once healthy and satisfying to his craving for action and adventure. In the Jack Books the longing of the normal boy for Western stories is gratified, the interest is absorbed and the mind is unconsciously led to phases of life that are elevating and instructive.

The books are the story of a young New York lad, sent to Stillwater ranch in the Rockies for his health, who becomes the companion of a veteran of the frontier. For each of six succeeding years he is led through new territory and experiences, accumulating much of the lore of plain and mountain, enriched with tales of the old West.

Ranch life, travel and hunting on the lonely plains, Indian camps, mountain climbing, trapping and canoeing are described. There is not a dull page, and the author manages to put much of the spirit of the West into his books. Jack is a real boy, and the books are stories for live boys—not lectures in disguise.

$1.25 per volume, postpaid. $7.50 per set

Jack The Young Ranchman
Jack Among The Indians
Jack In The Rockies
Jack The Young Canoeman
Jack The Young Trapper
Jack The Young Explorer

FOREST AND STREAM PUBLISHING CO., 127 Franklin Street, NEW YORK CITY

THE OUTDOOR LIBRARY

¶ Seasonable Books dealing with every phase of life in the Open. Handbooks of Sport. Books that make "roughing it" easy. Books for Fisherman, Hunter, Yachtsman, Canoeist, Camper, Nature Lover. Books of Travel and Adventure for Young and Old.

Book Catalogue Free on Application.

Uncle Lisha's Shop.

Life in a Corner of Yankeeland. By Rowland E. Robinson. Cloth. 187 pages. Price, $1.25.

The shop itself, the place of business of Uncle Lisha Peggs, bootmaker and repairer, was a sort of sportsman's exchange, where, as one of the fraternity expressed it, the hunters and fishermen of the widely scattered neighborhood used to meet of evenings and dull outdoor days "to swap lies."

Sam Lovel's Camps.

Rowland E. Robinson. Another charming story of life in innermost Yankeeland. Quaint and delightful stories of a delightful life. A splendid book for boys and scarcely less pleasing to their elders. Cloth. Illustrated. Postpaid, $1.00.

American Big Game Hunting.

The Book of the Boone and Crockett Club. Theodore Roosevelt and George Bird Grinnell, editors. Narratives of white goat hunting, elk hunting, old times in the Black Hills, prong-buck coursing, nights with the grizzlies, buffalo days, blacktails in the Bad Lands, notes on forest reservations and game refuges. Contributors: Theodore Roosevelt, George Bird Grinnell, Owen Wister, Winthrop Chanler, Col. George S. Anderson, Col. Roger D. Williams, Archibald Rogers, F. C. Crocker, Dean Sage, and others. Cloth. Illustrated. Postpaid, $2.50.

Trail and Camp-Fire.

The Book of the Boone and Crockett Club. Editors: George Bird Grinnell and Theodore Roosevelt. Illustrated. Like its predeccssors, the present volume is devoted chiefly to the great game and outdoor life of Northern America; yet it does not confine itself to any one land, though it is first of all a book about America, its game and its people. Cloth, 353 pages. Price, $2.50.

American Big Game in Its Haunts.

The Book of the Boone and Crockett Club for 1904. George Bird Grinnell, Editor. This is a fourth and by far the largest and handsomest of the club's books. It opens with a sketch of Theodore Roosevelt, founder of the Boone and Crockett Club, and contains an extremely interesting article from his pen descriptive of his visit to the Yellowstone Park in 1903. Other papers are on North American Big Game; Hunting in Alaska; The Kadiac Bear; Moose, Mountain Sheep; Game Refuges, and other big game topics. 490 pages and 46 full-page illustrations. Price, $2.50.

American Duck Shooting.

George Bird Grinnell. With 58 portraits of North American Swans, Geese and Ducks, Plans of Boats and Batteries. Fifty Vignettes in the text and a chart of the topography of a duck's plumage. Cloth, 630 pages. Price, $3.50. Edition de luxe, price, $5.00.

The Art of Shooting.

Charles Lancaster. An illustrated treatise on the art of shooting. Illustrated. Cloth. Price, $1.25.

The Gun and Its Development.

W. W. Greener. With Notes on Shooting, Breech-loading Rifles, Sporting Rifles, Shotguns, Gunmaking, Choice of Guns, Choke-boring, Gun Trials, Theories and Experiments. "The Gun and Its Development" is the standard work of the age on projectiles and all relating to them. Fully illustrated. Cloth, 770 pages, New edition. Price, $4.00.

Domesticated Trout.

Livingstone Stone. Contents: Trout Breeding Works, Ponds, Buildings, Hatching Apparatus, The Nursery, Taking the Eggs, Hatching, Care of Alevins, Rearing the Fry, Growing the Large Trout, General Observations. Cloth. Illustrated. Postpaid, $2.50.

Modern Fishculture in Fresh and Salt Water.

Fred Mather, author of "Men I Have Fished With," with a chapter on Whitefish Culture by Hon. Herschel Whitaker, and a chapter on the Pike-Perch by James Nevin. Illustrated. Price, $2.00.

Familiar Fish and How to Catch Them.

Eugene McCarthy. A Practical Book on Fresh-Water Game Fish. With an introduction by Dr. David Starr Jordan, President of Leland Stanford Junior University, and numerous illustrations. Price, $1.50.

Training the Hunting Dog for the Field and Field Trials.

B. Waters. This is the latest and best manual on the subject. As an owner and handler of field trial dogs, and one having had an exceptionally wide experience in the field and at field trials, Mr. Waters was admirably equipped to write such a work. It has already taken its place as the standard authority. Cloth, 281 pages. Price, $1.50.

Log Cabins and Cottages.

William S. Wicks. This book covers building for the woods from the simplest shelter to the most elaborate cottage, cabin or house, and their furnishing and fitting. The details and directions are at once simple and comprehensive, and the illustrations are numerous and illuminative. Cloth. Illustrated, 44 full-page plates and numerous text illustrations. Postpaid, $1.50.

Pocket Kennel Record.

A handy book for immediate record of all events and transactions, relieving the owner from risk of forgetting important kennel matters by trusting to memory. Morocco. Postpaid, 50 cents.

Diseases of the Dog.

By Hugh Dalziel. A handbook for amateurs. Treats of the causes of disease in dogs, symptoms and treatment, modes of administering medicine, treatment in cases of poisoning, etc. Paper. Postpaid, 40 cents.

The Spaniel and Its Training.

F. H. Mercer. To which are added the American and English Spaniel Standards. Cloth. Illustrated. Price, $1.

Pheasants; Their Natural History and Practical Management.

W. B. Tegetmeier. New, enlarged edition. 16 plates. Cloth, 237 pages. Price, $3.50.

Woodcraft.

Nessmuk. No better book was ever written for the help and guidance of those who go into the woods for sport and recreation. It is simple and practical, and withal a classic, written with a rare and quaint charm. Cloth, 200 pages. Illustrated. Postpaid, $1.00.

Houseboats and Houseboating.

Albert Bradlee Hunt. The book contains forty specially prepared articles by owners and designers of well-known houseboats, and is beautifully illustrated with nearly 200 line and half-tone reproductions of plans and exteriors and interiors. A most interesting chapter is devoted to houseboating in England. Extra heavy paper, buckram. The price is $3.00 net. Postage, 34 cents.

How to Build a Motor Launch from Plans.

Charles G. Davis. A thoroughly practical guide for the amateur. Shorn of all blind technicalities, it considers displacement, good construction and faulty, stability, setting up the keel, framing and planking, with careful explanations. Each step is followed up to the care and running of the gas engine. Cloth, 9 folding drawings, 8 full-page plates, 40 smaller diagrams, 170 pages. Postpaid, $1.50.

Manual of the Canvas Canoe.

F. R. Webb ("Commodore"). Many illustrations of designs and plans of canvas canoes and their parts. Two large, full-sized working (24x38) drawings in a pocket in a cover. Cloth, 115 pages. Price, $1.25.

Canoe and Boat Building.

W. P. Stephens. Contains plain and comprehensive directions for the construction of canoes, row and sail boats, and hunting craft, directions that the amateur with tools can follow. Fifty plates and working drawings in separate envelope. Cloth. Illustrated. 264 pages. Postpaid, $2.00.

Canvas Canoes and How to Build Them.

Parker B. Field. The book gives very precise instructions by which a man with ordinary mechanical bent may build a serviceable canoe at slight cost—a plan and all working directions. Paper. Postpaid, 50 cents.

FOREST AND STREAM PUB. CO., 127 Franklin St., New York

No. 6 KEEPING POSTED

1. As you read Forest and Stream through each week, you are frequently reminded of one thing or another that you desire to purchase. Such and such must be supplied to make your Shooting, Fishing, Camping or Cruising outfit complete.
2. Possibly you need waterproof shoes, or waterproof clothing. Or a new tent? It is your intention to take a much longer trip this time, than usual. And you may be located where you do not have access to sporting goods houses where all of your wants can be filled. In fact, even the best of us are often in doubt when it comes to knowing **where** to get the **thing** we want at the **right** price. You wish you had a friend at your elbow to suggest.
3. **Our** experts are right at your elbow. It does not cost you a penny (except your postage) to take advantage of their knowledge. They know **where** to **buy** and **how.** It is their business—and your advantage.
4. Glance carefully over our advertising columns. If you don't see what you want, write in to our Information Department. You will receive a full detailed reply—post haste—we're always on the job.

Isn't this worth while, if for no other reason than to get the **right** information on **how** to reach your destination by the quickest and surest routes—what railroads or steamship lines to take?

Don't put this off. Co-operate with us by telling your relatives and friends, what we can do for them.

Keep posted. Write to

Life and Sport in Labrador

NAPOLEON A. COMEAU.

In "Life and Sport on the North Shore of the Lower St. Lawrence and Gulf," Mr. Comeau has made a valuable addition to the literature of rod and rifle—and more. It is a book of engrossing personal interest to the sportsman or general reader, and of rare value to the student of wild life.

The author describes the events and experiences of fifty years, spent in the cause of humanity and science in one of the most interesting and least known sections of Canada. He writes as one sportsman to his fellows, detailing his experiences with the wild things of wood, shore and sea, with plenty of stirring experiences with big game and gamy fish.

Illustrated, 450 pages. Paper. Postpaid, $2.50.

FOREST AND STREAM PUBLISHING CO.

FARMER BILLINGS' OTTER.

"WALLACE DIXON, trapper, residing in Bardwell, Bradford county, discovered signs of an otter in a stream near his home, something he had not seen or heard of in many a year," said Col. Parker, who keeps track of the doings of hunter folk in this State and tells about them. "So he lost no time in setting his long idle otter trap.

"Orville M. Billings, farmer, and a leading citizen of the Bardwell neighborhood, knew nothing about otter signs or otter, and wasn't aware that Wallace Dixon had set a trap for one of those creatures along the Bardwell Creek. The morning after the trap was set he discovered a large sleek and exceedingly angry animal trying to make headway across country handicapped by a steel trap on one of its forelegs.

"Farmer Billings determined to kill the animal. He got a club and approached the beast with much confidence and too little watchfulness, for before he fairly knew what was going on the otter had taken firm hold of his leg and with a peculiar twist had flopped him flat in the snow.

"As Farmer Billings describes it, the ding thing was onto him and all over him, it seemed to him, before he had time to think, gnawing and clawing and snapping and snarling and growling, 'like a consarned wildcat an' mad dog both together.'

"Soon as he could think a little Farmer Billings made up his mind not to kill the animal but to get away from there as soon as he could. He kicked and pounded and thumped until he managed to make an opening of sufficient size between him and the otter to enable him to get to his feet. Then he turned to leave the otter to itself.

"The otter took positive hold of the farmer's leg again and absolutely refused to let him go away. Farmer Billings couldn't go without his leg, and so he was forced to stay there and rescue the leg if he could. Farmer Billings was of the opinion that the work of rescue lasted more than a quarter of an hour, but whatever the exact time might have been, the snow was covered with the mingled blood of the farmer and the otter when the work was done and the otter lay pounded out of existence.

"Shouldering the hard won trophy, Farmer Billings limped with it to his sled, tumbled the animal and the trap into it and drove home, where he was promptly put to bed and a doctor was sent for.

"When Trapper Dixon went out that morning to look at his otter trap, hopefully, but not confident, he was rejoiced although his trap was gone. He knew that the trap wouldn't have gone away of its own volition, and he knew there was no likelihood that any other animal than an otter could have got into it and walked off with it. So Trapper Dixon started on the trail, feeling more elation that any trapper in that part of the Keystone State had had occasion to feel in many a year.

"He followed the trail a long way and at last came to the spot where the maker of the trail had been intercepted by some one, saw the sanguinary evidences of the otter's struggle with that some one, and woke to the melancholy fact that the some one had not only gone off with the otter, but with the trap as well.

"'But I'll foller him up,' Trapper Dixon declared. 'I'll foller him and git that otter and that trap if I have to foller him all over the State of Pennsylvany.'

"Farmer Billings lived only two miles from the scene of his interference with the handicapped wild beast and Trapper Dixon trailed him straight home. The doctor in the meantime had been there and patched Farmer Billings up. But the farmer was far from feeling well.

"Trapper Dixon went into the house and without delay said to Farmer Billings that he had come after that trap of his and the otter that was in it.

"'And I'm obleeged to you like everything, Farmer,' said he, 'fer stoppin' of 'em as they went.'

Jacobs Bird House Co.
404 So. Washington St.
Waynesburg, Pa.

"Farmer Billings thought the matter over a little and then he remarked in effect:

"'Well, Dixon,' said he, 'if that's your trap you are welcome to it, but all I've got to say is that you're mighty careless leavin' it layin' around where critters like that can git into it. If it hadn't been for me there's no tellin' where that pesky beast would have lugged it to. And in rescuin' that trap I came ding nigh to havin' my last job. You can have your trap and welcome, and you're lucky. You want to be more careful with it.'

"Farmer Billings had the trap brought in from the woodshed and it was handed over to Trapper Dixon.

"'But where's the otter?' he wanted to know.

"'If that's the critter that was in the trap,' replied Farmer Billings, 'I'm goin' to keep it for my trouble. It's mine, for I ketched it.'

"And although Trapper Dixon sued Farmer Billings before Squire Capwell to recover the otter, Squire Capwell decided that the farmer had a right to the animal, according to law and equity, and he sold its pelt for more than enough to get him a new suit of Sunday-go-to-meeting clothes to take the place of the suit the fight with the otter put out of business."—The Sun.

GULLS SHOT BY ALIENS.

DURING the past two weeks several foreigners have been shooting sea gulls along by the dike near the Newark Bay lighthouse, says the Newark Call. They use a gull for a decoy which was trapped by them and to its leg is fastened a line that permits the gull to fly about fifty yards. When the end of the line is reached one of the three men pulls the bird in, and its struggling antics attract other gulls, which are shot by the two men in hiding. They kill the gulls for their wings. Several attempts have been made by sportsmen to apprehend these men, but so far it has proved a failure. They work on the low tide and are prepared to get away by using a rowboat. It is to be hoped that the fish and game commission will put a stop to the violation, even though it might be necessary to station a warden in the vicinity.

THE FISHERMAN'S TEST.

"How do you know," this man asked of the man hauling on the seine, "whether the fishes you catch are up to the limit fixed by the law? Have to put a tape line on some of them?"

"Well, no," said the fisherman, "we don't exactly have to go to that trouble. We have an easier way of measuring them than that.

"Every fisherman has sawed in the seat of the boat little notches of the right distance apart to indicate the lawful length at which fish may be taken, and when he takes out of the net a fish that doesn't look much too long he lays its nose against one of these notches and its tail against the other.

"If it touches the notches, why, into the basket goes the fish; but if it doesn't, why, then the fish goes overboard."—Waterloo (Ind.) Press.

BIG GAME IN AFRICA

The East Coast—Where the Lion is at Home
and the Elephant, the Leopard, the Hippopotamus, the Rhinoceros, the Tiger.

The Palatial Steamers of the

Union-Castle Line

Enable the Tourist to

Circumnavigate Africa
in Either Direction

Via West Coast—weekly sailings of Royal Mail Steamers from Southampton for Madeira, Cape Town, Port Elizabeth, East London, Natal. Intermediate ships leave London and Southampton weekly for Cape Town, Port Elizabeth, East London, calling fortnightly at Teneriffe, Las Palmas and Mossel Bay, and monthly at Ascension and St. Helena. Fortnightly service to Delagoa Bay (Lourenco Marques), and monthly to Beira and Mauritius.

Via East Coast—Sailings from London and Southampton every four weeks, via Suez Canal, calling at Marseilles, Naples, Port Said, Port Sudan, Aden, Mombasa, Zanzibar, Mozambique, Chinde, Beira, Delagoa Bay (Lourenco Marques) and Durban.

THE DELIGHTS OF AN AFRICAN TOUR

are hundred-fold. The **Victoria Falls**, that greatest of all cataracts, with a sheer drop of 420 feet, may be reached by either West Coast or East Coast service by rail from Cape Town, Port Elizabeth, East London, Natal or Beira.

The Biblical Ruins of Sheba—supposed to be the ruins of Solomon's temple, are only a few miles from Victoria.

Intending Tourists and Hunters are invited to address, for full information, literature, and through bookings

The Angler's Workshop

RODMAKING FOR BEGINNERS
By PERRY D. FRAZER

A unique work, bringing the science of rodmaking up to the very moment and epitomizing the knowledge and the experience of experts for the guidance of the average man. The evolution of bait-casting principles has made Mr. Frazer's book supersede all previous publications on the subject.

Every angler—young or old—who is fond of adapting his rods and tackle to his own ideas of what they should be, will find in this book a large fund of information gathered by the author in years of study, experiment and practical experience in fishing, tournament casting and at the work bench. He theorizes and speculates not at all. He tells "the how" of everything connected with rodmaking in a way that makes results certain. All explanations are simple and easily followed.

Separate chapters are devoted to each of a half dozen types of bait-casting rods; to tarpon, surf and light salt water rods; bass and trout, salmon and tournament fly-rods. Complete specifications of well known types are given, and the chapter on split bamboo rodmaking is the most comprehensive treatise on the subject ever published. Indispensable in the angler's library.

Cloth, 180 pages, four full-page illustrations, 60 working drawings, making plain every feature of the text. Postpaid. $1.

FOREST AND STREAM PUBLISHING CO., 127 Franklin Street, NEW YORK CITY

The Game Book

STANDARD BIG GAME MEASUREMENTS

Every man wants to compare his trophy with those of other big-game hunters. But comparisons are useless unless there is a fixed standard.

The game book of the Boone and Crockett Club, the foremost organization of hunters of American big-game supplies this. Compiled by J. H. Kidder, it provides directions for standard measurements of the large game animals of America, with spaces carefully arranged for complete data regarding the kill, locality, time, conditions, etc.

It is handsomely and durably bound pocket size. It is an invaluable record for every man who goes into the wild for sport with the rifle, a handy book, a camp companion, and a library reminder of days afield. Leather.

Postpaid, $1.50

THE OBJECT OF THIS JOURNAL

will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects.

—FOREST AND STREAM, Aug. 14, 1873.

A VERMONT VICTORY.

THE first real fight in behalf of conservation in the State of Vermont ended recently in a victory for the conservationists—that is, the people of the State.

The question arose over a bill to control the Ottauquechee River—a measure to grant the Champlain Realty Company authority to float logs down the Ottauquechee River. The realty company desired the right to improve the channel of the river in order to permit timber cut on its lands along the river to be floated down to the Connecticut River. The Champlain Realty Company is said to be a subsidiary company of the International Paper Company.

It was held by the opponents of the bill that this stream not being navigable, the riparian owners owned to the center of the stream, that the bill conferred on the corporation the right of eminent domain, that the measure would cause irreparable damage to the residents along the valley, that the Champlain Realty Company was asking that the sovereignty of the people over this stream be surrendered to it, and that the rights of private persons should not be taken for the benefit of a corporation.

The fight in the House was led by Colonel F. S. Billings, whose interest in this and other matters of conservation and preservation is very great. Mr. Billings—a former New Yorker—is a member of the Boone and Crockett Club and a successful big-game hunter. His energy and care in getting to the bottom of this whole matter made him a most effective leader, and he was ably supported by many other members of the House. This was emphatically a fight of the people of Vermont to preserve their lands and streams. They are to be congratulated on the able leadership and the sturdy devotion to principle which defeated this bill.

HOWARD M. BULLER, who died on Dec. 22 in his forty-fifth year, was one of the Buller brothers who have long been identified with fish cultural work in Pennsylvania. William Buller is superintendent of the Corry hatchery; Nathan R. Buller is superintendent of the Wayne hatchery; A. G. Buller is superintendent of the Erie hatchery; Howard M. Buller was superintendent of the Bellefonte hatchery.

THE SPORTSMAN'S DUTY.

ELSEWHERE in this issue we print an argument in favor of the hunting of prairie chickens without dogs. It is not a new proposition, it will not be received with much favor, but it is worthy of careful thought, as it is indicative of one of the many new directions in which public opinion trends when old and well-tried plans have failed.

There was a time when it was the belief that the then abundant prairie chickens could be saved by the passage of proper laws. Little by little these laws were passed, from time to time they were made more stringent, but still the supply of birds dwindled. The settling up of the prairie country was largely accountable, but this and the great increase in the number of hunters are only items in the long list of reasons for the increasing scarcity of birds. In the prairie country as elsewhere the great truth has long been apparent, that good laws alone will not bring desired reforms. There must be rigid enforcement of these laws by conscientious wardens, and honest observation of them by farmer and sportsman alike. There have always been too many "sooners" in the chicken country—men who shoot the young birds in early autumn in the closed season. There has been too much zeal to be on the ground early before "the other fellow" has had his chance. In a wide region, where wardens are few and far apart, minor infractions are lost sight of, if indeed many of them are observed at all.

Meanwhile the glorious birds of the prairies have decreased in numbers at an alarming rate, and this, too, in a remarkably brief time. To follow them with good dogs has ever been a keen delight; to hunt them without dogs would, to the old sportsmen, seem a hollow mockery. Many would, if compelled to choose, prefer to leave their guns behind and take the dogs. To watch intelligent dogs at work is to many a greater pleasure than the shooting.

It may come to this, not only on the prairies but in the stubble fields as well. If we are to have game, there must be more restraint, less license and selfishness. We must be satisfied with the interest on our capital, for encroaching on the capital year by year is ruinous.

Bag limits are excellent where game and fish are scarce, but elsewhere the plan leaves much to be desired. In States where game and fish are abundant, and in which limits have lately been imposed, the number is invariably too high. There it is noticed that large parties return home, each man with the exact number allowed by law. Special efforts are made to fill out that number, and even the least skilled members usually boast "the limit." Then there are gunners who regard the fall bag limit as their just due, since they have paid for a license to shoot.

What has been said of the shooting is equally true of fishing. Ruinous methods of taking fish, in season and out, have too long been tolerated. Our laws are in the main excellent, enforcement fair, observance not what it should be. The time may come when it will be necessary to impose other restrictions which, to the average angler, will prove as odious as would the barring of bird dogs to the gunner. It is not unlikely that one of these will be the prohibition of all forms of angling save fly-fishing in certain waters. This has already been done in Michigan and, as we have pointed out, the result has justified the means employed. There one of the trout streams has by law been closed to all lures save the fly, and in it the trout have increased.

Limiting the angler to the use of single hooks will probably be another restriction.

Licenses to fish may be the next move, and the fishing public generally will have only itself to blame if this change is brought about. There are already indications that this will be accomplished, if at all generally, by enlisting the support of the gunners who do not fish but who pay for shooting licenses. A license to fish or shoot at one's option will probably be the entering wedge, to be followed by separate licenses, costing individuals but a small sum, but producing large revenues.

President Taft said, on New Years day, that it is the administration's intention this year to enforce strictly the existing laws rather than to look for relief from present ills in new laws. It is an excellent sentiment. It should be remembered by all persons interested in game and fish preservation. Present laws need only be made more simple, and enforced.

THE conservation movement is gaining strength. Its effect may be seen in the court decisions against the pollution of streams. The State Board of Health of New Jersey has ordered a half dozen villages lying along the Hackensack River to stop polluting that waterway, although the portion of the river affected is tide water. The Supreme Court of New York State has ordered the village of Sharon Springs to stop polluting Brimstone Creek. The village contended that the State had approved the plans for its sewage system; the riparian owners, mostly dairymen, complained that the water was unfit for use. The court held that no prescriptive rights on the part of a municipal corporation or of an individual exist to create a public nuisance detrimental to the rights and health of riparian owners.

WHEN John Enright, the famous salmon fly-caster and angler, died in the prime of life, his mother felt his loss more keenly than any of her friends thought. She continued to look after the welfare of the guests at her hotel in Castleconnel, Ireland, many of whom were anglers, but early last month her health failed, and in a week she was laid to rest beside her son in the cemetery overlooking the beautiful River Shannon, so well beloved by both.

THE SPORTSMAN TOURIST

Baltimore to Bangor and Back

A Leisurely Cruise on a Small Yacht from the Chesapeake Northeastward

By E. P. MORRIS

THIS title is, to be sure, rather aliiterative than precise, for we sailed a little beyond Bangor and we came back only as far as our home port, New Haven. But it will serve to outline a three months' summer cruise.

The craft that carried us is a small schooner yacht of Crowninshield design and Gloucester build, 35 feet waterline, 50 feet over all, nearly 8 feet draft. She is snugly rigged, with a main boom that hardly goes over the taffrail and without topmasts. For light sails she carries a balloon jib and a fisherman's staysail, both extremely useful in long runs. She is strongly built and rigged, an excellent sea boat, easily handled in any weather by two men; in short, she is a cruiser, pure and simple. I have always been an admirer of the Gloucester fishing schooner and I was greatly pleased to come upon a yacht which, in build and design and in appearance, too, is a kind of refined fisherman, a yacht and yet with the plain evidence in her looks of her descent from hardworking ancestors that had seen service on the banks. Two or three times, as we were lying at anchor with our swordfish stand conspicuous on the bowsprit, we had the amusing experience of hearing discussions of the question whether she was a yacht or a fisherman, carried on in that far-reaching tone of voice which characterizes conversation in a motor boat.

I am not sure that this uncertainty about our appearance and character was as agreeable to all the company as it was to me, but on the other hand our vanity was highly gratified when, on three occasions, we were saluted by the name of another yacht, the very prettiest little schooner, we think, now afloat. Such flattering resemblances bring with them their peculiar temptations, and we may come to grief in trying to live up to the company we keep. Indeed, the plans which we are making for smoother paint next summer and for neater rigging seem to show that we are not untouched by social aspirations. But by keeping the swordfish stand on the bowsprit and by remembering the family tree in Mr. Crowninshield's office, we hope to remind ourselves that our grandmother belonged to the working classes.

She is what wou'd be called a two-man boat; that is, she does not need more than two men to handle her even in a crowded harbor or in heavy weather, and I began the cruise with one man, counting myself the second.

It would be impertinent for me to praise my companion and helper, but I cannot allude to him without saying that we are all under a debt of gratitude to him for unvarying courtesy, kindness and generosity. I have had some experience in cruising, but for each thing that I know about handling a vessel he knows twenty. Nominally on the ship's papers I was master, and I thought it fair to assume the responsibility for difficult decisions, as I should have taken the responsibility for disaster, but he was more truly skipper than I was, and I shall call him by that name. In one respect we were almost equal; there is a motor in the 12-foot tender and neither of us knew or cared much about an engine. The result was that the machine ran—at times. It was like a telephone, an intolerable nuisance, and an indispensable convenience. It was in the hands of some eight doctors, each of whom had his own diagnosis, expressed with unconcealed contempt of the physician who had preceded him in the treatment of the case. But the engine towed us into harbor three times when it was distinctly convenient to get in and served us admirably after we had added to our crew a competent engineer, in the person of the skipper's son. I suppose that one cannot get the best out of even so inanimate a thing as an engine without paying the price of a personal interest in it. My affections were wholly given to the schooner and to sails, and the engine felt it and would not work for me. Next season I shall make an effort to overcome my repugnance and learn to pat it and rub it down. If I can conceal my sordid desire to get work out of it, I believe it will run.

THE YACHT.

The yacht was at Baltimore when I bought her, and the summer's plan included a start from there and a cruise down the Chesapeake. The skipper and I took possession on June 3 and spent two weeks in cleaning and painting and rigging. This was short time, and it was made still shorter by rainy weather, which hindered us on the outside work. On the other hand the location of the Baltimore Yacht Club at Curtis Bay is very beautiful. The low-lying shores, the variety of foliage, the appearance of perpetual high water which results from the slight fall of the tide made a most agreeable picture. The former owner of the yacht, in addition to many other kindnesses, had put me up at the club, and we experienced the warmth of Maryland hospitality. The steward served us with crab soup—a most delectable compound—and with strawberries grown on the place. "Charlie" supplied unlimited information, and the club launch was always pleasantly at our disposal. With these agreeable adjuncts to some pretty hard work we got the boat into fair condition and were ready to sail when my family joined me on the 16th of June.

We spent the next fortnight in a leisurely cruise down Chesapeake Bay. This was new to all of us, but we were supplied with charts and had no special difficulties in navigation. A certain amount of special care, however, is necessary, for the shoal points run off to great distances, and one is constantly surprised to find that the light or buoy he is looking for lies so far off the land. It happened, too, that the air was at this time full of smoke. We could hardly see more than five miles and were often confused in judging distances.

The thunder squalls for which Chesapeake Bay has a reputation did not trouble us greatly. There were some sharp ones at night, but none of any weight while we were under way. The breeze was usually rather lighter than we are accustomed to on the New England coast, lighter even than the sound breezes, and it was pretty steadily from the southward, but we were not

hurried and were glad to see as much as possible of the coast. Our harbors were Magothy River, Oxford on the eastern shore, Solomon's Island, Wicomico River on the western side, Severn in Mobjack Bay and Old Point Comfort. Each has its peculiar interest in our memory. We shall never forget the sweeping shores of the Wicomico, with the stately pine grove running out to a low sand spit where a solitary heron was standing, nor the friendly interest of Oxford in the visitors from the North, nor the beautiful silence of Severn. But of them all Solomon's Island was the most delightful. No cruiser in the Chesapeake should pass the harbor. It is in the deep and beautiful mouth of the Pawtuxent River, where the little island on the northern side incloses a small harbor, which in turn has still smaller islands within it and runs up into half a dozen tiny coves. Nothing could give a deeper sense of security; it is doubly landlocked and peacefully remote. Yet it is by no means an inactive place. It is one of the homes of the bugeye, and these picturesque little vessels lay at moorings around the harbor or were hauled up along the beach under the trees. There is a good store here for provisions and to my surprise we found water running from a pipe on the wharf, drawn, I learned, from artesian wells that supply the island. We filled our tanks, and the supplies that we laid in included soft shell crabs at forty cents a dozen. The engine in the tender called for tinkering here, and while the spark plugs were being adjusted in an out-of-doors shop, we were invited to refresh ourselves among the branches of a cherry tree that overhung the beach.

Here, as everywhere in the Chesapeake, we found the human element quite as interesting and novel as the scenery. There was a dignified and friendly courtesy of speech and bearing that charmed us, and the soft voices, the soft air, the low shores and the brimming levels of the waters seem, as we recall them, to make a harmonious picture of leisure and of peace; that is, I think, the permanent impression which we retain from this part of our cruise.

To return to the practical side, Solomon's Island affords the only clear illustration I know of an error in a Government chart. There is, it is true, a channel where the chart gives one close along the northern shore, but the usual and deeper channel, taken by the steamer, is directly out from the point of the island where the chart gives only four feet. I had been told of this in Baltimore, but might have hesitated to take it if I had not been piloted by a local boat.

In general, in the Chesapeake cruise, the steady beating with light southerly winds became a little wearisome, and we missed some of the panorama of the shore by being obliged to keep out so far. The heat was once or twice excessive, but this was chiefly in harbor, where we could protect ourselves with awnings and could find a beach for bathing. It was a pleasant surprise to find so few mosquitoes. We had made abundant provision against them with netting to cover all openings, but it was not until we were on the Maine coast that we were seriously troubled by them. To make up for this exemption we suffered, and suffered very seriously, from a plague of flies, which increased as we got down toward the tower end of the bay and reached their maximum as we were running up the coast outside. They seemed to be different from the common house fly, and they bit ferociously, even through thin clothing, not infrequently drawing blood. We did all we could think of to get rid of them, but without any effect, and when we were sailing at night and had expected to make up sleep in the day time, the inconvenience was great. But this was only in part chargeable to the Chesapeake, and it was the only considerable drawback to our pleasure.

So far as one may venture to speak from the experience of a single cruise, I can most earnestly commend the Chesapeake to Northerners. Probably May would be a better month than June for those who can get away at that time. Possibly April would not be too early. A shoal draft boat would enable one to explore the rivers that we had to pass by like the Choptank River and the tributaries of Mobjack Bay, and since the object would be sightseeing, and the chief interest would be in the harbors and rivers, it may not be heresy to suggest a motor boat. I had expected to find many yachts here, but between Baltimore and Old Point Comfort we saw only two.

As we had a long run before us up the coast, I did not go over to Norfolk, but contented myself with the poor anchorage at Old Point Comfort, just beyond the pier, behind the bar. Here we spent two nights of uneasy rolling, swung across the sea by the strong tide. This is probably a fairly safe anchorage and I noticed that it was used by two pilot boats, but it was in most uncomfortable contrast to the name of the place and to the quiet harbors where we had been lying. We got our mail, however, laid in supplies, saw Fortress Monroe and waited for the weather to settle.

The sail up the coast was a chapter by itself and of course a very different matter from easy cruising in the bay. The first stretch was of about 140 miles to Delaware Breakwater, with Assateague half way up as a possible harbor of refuge if the wind came in too strong from the northerly. On the morning of the 28th the weather was still so unsettled that we waited till 9 o'clock before starting and spent the time in getting weather predictions from shore and from a pilot boat. But finally, as the barometer was steady and the weather showed signs of improvement, we got under way and stood out across the bay for the bell buoy off Cape Charles. The day did not continue to improve and thunder showers worked about both to the east and in the southwest, killing the wind. By night, however, we were fairly on our way up the coast with a light southerly wind.

In the early evening we caught some sharp puffs and had to lower mainsail and run for a while under foresail. Toward morning the light southerly wind came in again and—not to make too long a story of what was at the best a dull business—it lasted for the next thirty-six hours, long enough to carry us to the breakwater by

BUGEYES AT SOLOMON'S ISLAND.

WATERFRONT AT BUCKSPORT.

noon of the third day. It was a slow passage, fifty-one hours for 140 miles, and it was rather wearisome, especially the second night. We kept about five miles off shore, hoping in this way to give outlying shoals a good berth and yet avoid the steamer track, but we were bothered by the fish weirs, which are set a long way off the beach. At night they are marked with lanterns, but until we understood what these lights were, we were rather confused than helped by them. The atmosphere, too, was thick with smoke and haze, so that it was difficult to make out shore lights, and we passed inside of the Overfalls Lightvessel without seeing it. But by pretty careful steering and by keeping track of the log we were able to pick up enough of the offshore buoys to feel secure of our course and position, and the thunder of the sea on the long beach would have been sufficient warning if we had gone in too far.

Toward morning of the second night we passed fishing vessels at anchor or drifting to one end of a net, the other end being marked by a boat with a light. The sea was at this time very smooth, the breeze was just strong enough to keep our sails quiet, and we slipped along past the fishermen as if on velvet without a sound. As soon as the increasing light made it safe, I lay down for an hour's sleeping, exacting from the skipper a solemn promise to call me at the end of the hour, so that he might have a turn before the sunlight roused the flies and made sleep impossible. This was the first nap we had had for forty-eight hours, and I plunged into it so profoundly that when my hour was up, the skipper was obliged to come down into the cabin and shake me vigorously to stir me.

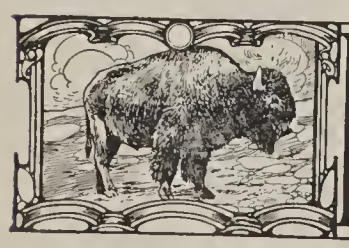
We anchored behind the inner breakwater at noon. There is nothing here to detain the cruiser. The lighthouse on its great pits of yellow sand is the only spot of beauty in the landscape. The town is wholly uninteresting, and with a southerly breeze the stench from the fish works is really horrible. We got ice and water, and what we needed most, a night of heavy sleep, and then with a steady barometer and weather predictions of "the same thing" from the station on the breakwater, we got under way at 4 A. M., July 1, for Sandy Hook, distant 125 miles.

In making my plans beforehand I had proposed to go across from Delaware Breakwater to Montauk Point, avoiding New York and the familiar Sound, having counted as a matter of course upon getting plenty of sleep during the day time, when one man on deck would have been enough. But the unexpected pest of flies made sleep entirely impossible between sunrise and sunset. Heavy-headed as we were, their savage biting kept us awake, and I could not risk two or perhaps three more sleepless nights. We were short-handed for such work, and I therefore laid our course up the Jersey coast, the breeze still light southerly and the sea smooth. There was little of interest in this stretch. Atlantic City, which we passed about 8 o'clock in the evening, was a beautiful vision of electric light like a necklace of shining jewels. I had not thought that anything electric could be so beautiful. In the morning a great school of sea porpoises, leaping and blowing with a vigor never shown by the sluggish porpoises of the Sound, enlivened our jaded nerves. But the night was a long struggle against sleepiness. We had lunch and hot coffee at midnight, we changed often from the wheel to the lookout, we talked of the most interesting things we could think of, but it was a long night and we quoted the words "as they that watch for the morning" with full understanding of their meaning. I got some amusement from noting the whimsicalities of the mind, when the senses are awake and the judgment is asleep. At one time I found that I was mistaking the lighted binnacle for a rather oddly shaped bowl of soup into which I was for some reason gazing with bowed head. At another time hearing the sound of the water under the counter as we slipped along and perhaps with a sensation of cold feet (in the literal, not the slang, sense), I thought I was wading up a stream of swiftly running water. Once I was startled into wakefulness by seeing the skipper, as I thought, turn a kind of handspring and put his feet up into the mainsail. This was no doubt due to a failure to control the muscles of the eye, the same cause which makes a distant light move with a sudden jerk when one is dropping asleep against his will with his eyes open. But morning came at last and the day slipped slowly on, and at five in the afternoon we anchored inside of Sandy Hook, under an oppressive pall of smoke, having been thirty-seven hours under way.

I do not know whether we should count ourselves lucky in these long runs or not. It is slow work to spend eighty-eight hours in sailing 265 miles, a distance that we might reasonably have expected to make in half the time with an ordinary southwester. But there are plenty of worse things than slow sailing. Even such a negative discomfort as lying over for three or four days in the stench and monotony of Delaware Breakwater would have been worse, not to speak of head winds or heavy weather.

On the whole I think we were fortunate, and I am glad to remember that we had self-command enough to avoid increasing the tedium by impatience. All of us, even the youngest and most active, took it philosophically, reading and writing and occupying ourselves with odd jobs about the boat. We cooked and cleaned and varnished, and the first afternoon was made joyous by a birthday celebration for which one of us provided the occasion, and the forethought of another provided a cake.

[TO BE CONCLUDED.]



NATURAL HISTORY

Scavengers of the Lake.

The wind had been blowing a gale from the south all day, lashing the lake into fury, and the waves beat savagely on the north shore, where we were camped.

The next morning dawned clear and still, the wind having gone down with the sun the night before. I arose early and rowed alongshore, which was now lined with a kind of moss that the waves had washed up. The crows were unusually busy. From the trees, where they were exceedingly noisy, they frequently descended to the beach and walked along the edge of the water, every little while snatching up some morsel of food or making a wonderful ado over a dead fish.

A sharp-shinned hawk seemed to be playing hide-and-seek with them in vigorous fashion, chasing the crows or being chased by them, though I saw no real passage at arms between them.

Upon examination, the shore line, with its fringe of moss, was found to possess food in plenty of the kind that crows love. The line of moss held many bruised and battered crayfish, an occasional dead fish and dead insects of various sorts, especially a large mosquito-like insect which the residents called the lake fly. These crows were securing breakfast, and in doing so were cleaning up the shore. They are to the lake what the scavenger wagon is to the city.

Another day, when the wind was from the west, I found these scavengers on the east shore, and whenever I noticed them during a month's stay on the lake, they were always on the leeward shore, feeding on the insects, mussels, crayfish, minnows and fish that the waves had made available. To a young man whose home is on the lake, I mentioned the fact that the crows kept the lake cleaner and sweeter than it otherwise would be, by eating the carrion found on the shore, thinking that possibly he did not appreciate their value.

"Yes," he replied, "and the buzzards, too. They eat dead fish, but my! they are ugly."

The turkey buzzard I had not recognized. I had seen one soaring at a distance, but mistook it for a large hawk; but after the young man told me of their presence I saw them several times soaring over the shore after a heavy gale. There are not many of them in the Northwest, for their kind of food is scarce. In southern Texas, where many weak cattle perish in the clay-bottomed bayous, I have seen them soaring and circling in companies of hundreds, evidently in play.

One of the most interesting, and possibly one of the most useful scavengers of the lake

is the omnipresent black tern. There is no part of the lake's surface which they do not explore. Throw a dead minnow from your can and you will soon see a tern lift it from the water and swallow it as he flies. The sharpness of their eyes is marvelous. Nothing escapes them. And they are so numerous on all the Northern lakes that every foot of water surface is scanned by their quick eyes. If, while rowing, one looks steadily for a moment in any given direction, a tern is sure to come in sight.

One day I threw out some minnows that lay dry and stiff on the bottom of my boat. The terns immediately gathered them up, but instead of swallowing them at once, as they would minnows freshly dead, they flew low over the waves and dipped them in the water many times until the film upon their scales had been moistened, evidently so that they could be easily swallowed. The fishermen told me that they had frequently thrown up minnows ahead of these terns, and that the birds would take them in the air, as a kingbird takes a fly. This I tried repeatedly, but without success.

These interesting birds came frequently to our pier, where they perched upon the posts and gathered up the dead minnows that we threw out for them. So tame did some of them become, that by approaching very slowly I caught one in my hand. The accompanying photograph was secured from one of the pier posts at a distance of about three feet. These birds, like our bluejays, seem to be omniverous. They will gather up most any morsel that one throws upon the water; and in the spring they are seen feeding over inland sloughs where there are no minnows.

The neatness and precision with which they lift any morsel from the water is beautiful to see. Their bodies seem never to be brought nearer than two or three inches from the surface, then the mandibles part, the head dips gently—if the water be rough sometimes the opened mandibles point straight downward—and the morsel is lifted as unerringly as one could lift it from a hard surface with the fingers. Sometimes, it is true, the bird misses and has to wheel a second time; but this seems to be due not so much to miscalculation as to the probable fact that the eye, owing to the action of the waves, lost the object at the crucial moment.

Gulls search the Northern lakes for food, as do the terns. Of course, these birds take minnows alive, and one frequently sees them hover, hawk-like, a moment, and then plunge full into the water for their prey; but between gulls and terns, few morsels of food are left to litter the surface of a lake and strew its shores with decaying waste.

Another bird that, at least in a small way, may be reckoned among the scavengers is the swallow. They live on flies, and as far as I am aware, catch them alive. But the life of most flies is short, and those that are not taken alive, soon fall dead. I have mentioned the "lake flies." For a few days they swarmed along the shore in myriads; but after their short life was ended they were seen littering the water, and in masses washed upon the beach.

One day in a stiff gale, when a broken oar compelled three of us in one boat to drift to the lee shore, we found thousands of bank swallows feeding upon these flies which the wind was driving ashore. The swallows were in an open pasture, separated from the beach by a fringe of trees. Every wire of a fence was lined with swallows, sitting close together. They swarmed over the short-cropped grass, taking the flies on the wing, while hundreds of them lit upon the ground and picked the flies out of the grass.

Sandpipers and other birds gather all their

SOME OF THE SCAVENGERS.

food at the margin of the water, snatching eagerly whatever the waves wash up. The amount these birds eat would seem to be comparatively little, and yet, beyond question, they help materially to keep our lake shores sweet and clean. A number of animals help also. While walking in the timber on the shore of Lake Delavan, Wisconsin, through a little opening in the foliage, I saw four half-grown minks eagerly making their breakfast of a large dead fish which lay at the margin of the water. A shot from my .22, which went wide of the mark, sent them scampering to their hole in the bank.

We have seen the muskrat eating the pulp out of green bullrushes; we have had evidence that made us suspect him of occasionally robbing blackbirds' nests; and we have read of his being fond of clams. Will he eat a dead fish if he finds one cast up by the waves? I found one of these animals the other day far from rushes, and far from all his ordinary food, so far as I know what that food is. I was passing a farm house with my camera when one of the family said, "See what we have under our porch!" A muskrat had come up from the lake or from the swamp half a mile distant, and was living under a little porch in a nest that he had dug in the dirt.

At scavenger work, wolves and coyotes also help. A dead fish is a choice meal for them, and they are not infrequently seen at the margin of the water enjoying their prey; in fact, the margin of a lake, whether in prairie or forest, mountain or plain, is a favorite resort for both animals and birds, not only for the sake of water, but for the food that may there be found.

CRAIG S. THOMS.

A Jaguar in Texas.

THE jaguar formerly ranged over a great part of Texas, south of the Red River, but has long been regarded as extinct in that region.

At a recent meeting of the Biological Society of Washington, however, Vernon Bailey recorded the killing last spring near London, Kimble county, not far from the Llano River in Central Texas, of a large jaguar. Mr. Bailey exhibited a lantern slide photograph of the dead specimen, together with a map showing localities within the United States where this animal had been taken.

Malaysian Wild Pheasants for New York.

PROF. C. WILLIAM BEEBE, curator of ornithology, New York Zoological Park, who has been in the far East in search of pheasants, has met with success by securing a complete collection of fine specimens. Consul-General James T. DuBois writes from Singapore that in Borneo the curator secured specimens of all of the pheasants, obtaining eleven live birds. Exhaustive studies, photographs and paintings were made of the birds in their native haunts. Prof. Beebe is now in Java, where he expects to secure a fine lot of specimens.

Fur Seals in Captivity.

AT a meeting of the Biological Society of Washington, held last month, Dr. B. W. Everman reported that the two fur seals which came to the Bureau of Fisheries last spring, an account of which was printed in FOREST AND STREAM, were still in good condition. Of the ten fur seals referred to in FOREST AND STREAM recently as brought from the Pribilof Islands to Seattle, two were to remain there, two to go to Golden Gate Park, San Francisco; four to the National Zoological Park, Washington, and two to the New York Aquarium.

The FOREST AND STREAM *may be obtained from any newsdealer on order. Ask your dealer to supply you regularly.*

GAME BAG AND GUN

A Greenhorn in a Logging Camp.

SEEING an advertisement in a daily paper for woodsmen, and having used all kinds of edge tools, I thought I might be the right man in the right place, so applied for a job. I got it. My outfit consisted of the clothing suitable for the arctic regions, a box of medical supplies, rifles for large and small game, and a shotgun with a stock of ammunition, and a good supply of fishing tackle. I now felt ready to tackle any kind of game which I had heard was abundant.

I arrived at Hastings Junction at 8:30 P. M. and boarded the company's log train, consisting of a locomotive and ten flat cars. The line runs back in the woods for twenty-nine miles, and is extended each year as the timber is cut. I arrived at the company's central camp at 9:30 P. M. and was ushered into supper with twenty other arrivals.

Next morning I was sent to Camp 12, ten miles away, and as the only method of transporting luggage was on one's back, I wished my outfit not quite so extensive. However, after a hearty breakfast I took my load on my back and set out. I finally reached camp and met the boss who took me to the sleeping shack and showed me my bunk. The foreman asked me if I could file saws, and as this was one of the things I could do, I got a job filing saws. As a saw filer I proved a success, putting the saws in good order in about half the time of my predecessor. The foreman (Josh) seemed pleased at getting the work done so quickly, and told me my time was my own after the saws were in order. Being fond of hunting and fishing, I took my rifle and fishing tackle and explored the country in my spare time.

In Cloud River, which flows close to the camp, and is the outlet of a lake of the same name, I saw numbers of fish jumping. I got my rod and line ready, and with a piece of meat for bait—at Josh's suggestion—I baited up, and casting, immediately a trout seized the bait and I hauled him out on the bank, cast in again and the same thing was repeated. I kept up this exciting sport for about two and a half hours until almost sunset, and found on gathering my fish together I had eighty-six trout, running from one-half to two and one-half pounds in weight. At this time I knew nothing of fly-casting, else I might have secured them in a more sportsmanlike manner. The trout were a heavy load to carry over rough granite and windfalls. As I passed the sleeping shack on my way to the cook house, one of the crew spied me and passed the word to the others. They surrounded me, spread the fish on the ground to count and examine, and all joined in a chorus of questions as to where and how I caught them. They agreed that the following Sunday they would all go "a-fishin'." We had trout for breakfast the next morning, and what a treat after a steady diet of beans, molasses, tea and dried beef!

A few days later a new arrival came to camp and was put in the bunk with me, I being the only man sleeping alone. I introduced myself and Ike and I soon started up a conversation that to us was intensely interesting. He had spent the previous winter in the same camp and was a thorough hunter and trapper. Ike asked me about my experience in moose hunting and I had to admit I was a greenhorn. He suggested that as I had a good rifle, and he was a good moose caller, we should have a try at the next full moon, which would be in a few days. He said there were plenty of moose around, and telling of different ones he had called and some he had still-hunted made me very eager to start out. I got out my rifle, cleaned and oiled it, looked at my cartridges and my hunting knife and found all in good order. Ike admired my equipment, but said it was good enough for an elephant. He reached under the bunk and pulled out a very long rusty looking gun and asked me what I thought of "her." It was a .52 caliber Snider single shot rifle in very poor condition, but Ike assured me "she was all right." I thought if "she" was, my .32 special was good for any game in these woods.

While we were talking, the shack man called out, "Nine o'clock, turn in," and Ike and I crawled into our bunk, and soon there was a chorus of snores in which I presently joined.

The next day when Ike came in to supper, he brought with him a large piece of birch bark to make into a horn to call the moose with. After supper he made a small fire on the ground and held the bark over it for a few seconds, when it curled inside out. He formed it into a megaphone and tied it with roots. He gave several grunts through it and pronounced it all right, and we hung it up in the shack for use the following night. As Ike was working some distance away from camp, he gave me instructions as to provisions, etc., telling me to get grub enough for three meals and stow it in a gunny sack, one of our double blankets, a good supply of matches, and some extra outside clothing. We arranged to start at 3 P. M., as we had about five miles to walk and should be at the calling rock by 5 o'clock. By 1:30 I had everything ready and it seemed as though 3 o'clock would never come.

All things come to him who waits, however, and promptly at 3 Ike arrived, got his old rifle and six cartridges and slung the grub bag on his back. I took my rifle, the bark horn and blanket, and we started down the tote road. We followed this for three miles till we came to Frog Stream, where we took the river drivers' trail two miles and came to a large clearing—burnt land on one side of the stream and a meadow and bog on the other—which was bordered by a hard wood ridge. In about the center of this meadow there was a large granite rock, one side of which formed a cave large enough for two or three men to get into. Ike said it was here that we would call if the wind went down in time. As it was blowing quite a fresh breeze, we put our packs in the cave, ate lunch and waited till sunset, hoping the wind would die down, but it did not. As it would be useless to call, we sat there talking in low tones, as Ike said there might be a moose within 300 yards of us on the hard wood ridge. We decided to divide the night, Ike taking a nap till 12, then I could turn in till 5 A. M. I pulled on my heavy sweater and Ike rolled himself up in the blanket, but before he went to sleep he cautioned me not to smoke. This was a hardship, for I thought a smoke would help me to keep awake.

Ike was soon asleep and I felt very much alone in the world. I did not mind the first hour or so, as the wind kept up and made a noise through the trees, but about 10:30 the wind died out, and it grew very cold. I moved over close to Ike and felt warmer; in fact, I was almost asleep when a peculiar sound startled me. I felt a little shaky and reached for my rifle which I laid across my knees. I felt a thumping in my breast, a choking sensation, with an occasional chill. I had just about recovered from the first shock when I heard the same noise again, but nearer. I made up my mind to awaken Ike, as I thought it might be a moose, so I gave his arm a hard tug, which roused him, and he bent over and whispered to ask what was up. I tried to whisper. My words came in lumps and jumps, but he got my meaning as I pointed with a rather shaky hand in the direction of the sounds. Ike threw off the blanket, hauled on his sweater, and we sat there speechless for perhaps ten minutes, when I heard the same sounds. Ike, looking very disgusted, told me to go to sleep, as it was only two porcupines calling to each other. It took only a few minutes to get off to sleep, and I knew nothing until I felt Ike shaking me, and heard him say it was a great morning to call, being clear, frosty and calm.

We had a bite to eat, and then Ike clambered up the rock and gave a call. It was unlike any sound I had ever heard. After he had waited about fifteen minutes he gave another call, and it was not many seconds before I heard a noise from the lower end of the hard wood ridge, and Ike came down and said he had an answer. He posted me at one end of the rock and told me not to make a sound, while he took up his position at the other end. We were out of sight of each other. Ike was looking over the burnt land, and I had a view of the meadow. Presently I heard a noise of breaking tree limbs and now and then a knocking sound. Being curious I crept around to Ike who gave me a terrible look, and whispered that the moose might come out at any moment, and that if I wanted a shot I must keep quiet, so I crept back as quietly as possible.

I now began to experience a most peculiar feeling. I shook, I choked; everything I looked at seemed to be an animal. My rifle was leaning against the rock within arm's length of me and I was straining my eyes in the direction of the approaching sound when suddenly it stopped. I do not know how long I waited there with chattering teeth, when I heard a sort of grunt

from the direction of Ike, and immediately there was a crashing and smashing of underbrush across the meadow. Soon an object came through the brush on to the meadow and stopped for a few seconds.

I saw it was a moose and a fine one, but it seemed I had forgotten that I had a rifle, and just lay there and stared and shook. The animal swung around and started straight for our rock and came within 125 yards, then stopped and put his head up to sniff the air. Just as he started to go, there was a loud report from Ike's old Snider, and when the smoke cleared, the moose was getting up. By this time Ike had another cartridge in his rifle, and fired again. When the smoke cleared I saw the moose running toward the river and Ike called to me to shoot. Up to this time I had not thought of shooting, but I picked up courage, grabbed my rifle, took careful aim and fired, and down came the old fellow in a heap. Ike called out, "Bravo!" and started to run toward him. I did not feel like getting too close till I was sure he was dead, but Ike went right up, took hold of one of the horns, and said that my bullet had broken his neck, and to bring my knife and cut his throat. I told him I thought he understood it better, and Ike said he thought I had a touch of buck fever. Ike cut his throat, counted the points on the horns and found there were eighteen, nine on each, which I supposed would make him a nine-year-old.

We finished dressing the carcass by 9 A. M., covered the meat with the hide and some moss and boughs, and started for camp. We hunted up Josh and told him of our luck, and he got one of the teamsters and a yoke of oxen and a go-devil—a kind of sled used in the logging woods—and after dinner we started after our moose. We got back, a very tired but happy pair, and I can tell you there was general rejoicing at the prospects of a roast of moose meat. The walking boss has the head mounted, and I have a fine rug made from the hide.

Happenings at Scraggy Neck.

EAST WAREHAM, Mass., Dec. 19.—*Editor Forest and Stream:* The two following incidents occurred some thirty-five years ago.

It was raining with that steady patter which promises an all day's storm, but the wind had risen, and there were some streaks of light through the dull lead-colored sky that indicated a change.

The boys were having a game of seven up, while guns and wet clothes were drying about the room. The shanty was only a short ways from the shores of Squeteague Pond and a mile from the gunning beach at Scraggy Neck. They had been down there early in the morning to try their luck at sheldrakes and old squaws as they flew across from the large bay to their feeding grounds in Red Brook Harbor.

Al Wing and "Old Tuck" were fox hunting on the neck when the boys arrived. Al had gone on with his hound, leaving Tuck to shoot the fox, when it came off. As these men had arrived first, Tuck had chosen the best stand, known as the "Seaweed Blind." This was about in the center of the beach either way, and the most popular and coveted of all the stands there. It was rightly named, well made with thick walls of dry seaweed, warm and comfortable on windy days and also was in the best place. This beach was really an isthmus between the neck and main land. As it was much resorted to by duck shooters, a number of blinds were strung along from one end to the other. Those nearest the center were considered the best and the boys took them, Sumner and Louis Landers going on the west side nearest the neck, while Henry Lombard and Tom Fuller settled themselves in some low dunes nearer the main.

As day came on, a fine drizzle started with a freshening southeast wind. This made ideal ducking weather, but was miserable for fox hunting. However, Al's hound had been for some time working up a track and now voiced out in great style, the fox running around the neck with the prospect of his coming off at any minute.

Out of courtesy to Tuck the boys had refrained from shooting at several fowl that flew over temptingly near, and all were expectantly looking toward the neck. Soon a bunch of red was seen coming across the open flat below Allen's barn. Every man made ready. In a moment the fox was on the beach. A high windrow of seaweed lay along high water mark. Below this the cunning fellow ran, and only a glimpse of his back was shown Sumner and Louis. Tuck saw the ruse, and jumping from his stand ran to head reynard off. It was close, the hound was in sight baying splendidly, foxy ran as never before and Tuck sprinted like Hippomenes running from Atalanta. Too fast, in fact, for he could not stop to aim, and fired a wild first into the seaweed, and a wilder second into space as he shot headlong over the windrow himself.

Lombard and Fuller were so intently watching the proceedings that they neglected to run across in time to get a shot, and the fox escaped. Their disappointment and Tuck's chagrin were as nothing to Al Wing's disgust when that worthy reached the spot wet through and out of breath, his hound and the fox gone off into the Succonnussett Hills for the rest of the day. He had gotten to the open in time to see Tuck's performance, and after some spirited remarks on very poor shooting, intended for all concerned, he pointedly asked Tuck if he had tried to catch the fox. "I seen you dive after him," he said.

By this time the storm grew worse and the gunners, with the exception of Sumner, started back to the shanty. Sumner was a gunner and had it in his blood. "I'm going to get a fowl," he said, as the others were leaving, but the fowl had all found their feeding places for the day, and after waiting for some time without seeing any, he left the beach and started back toward the shanty. As he neared Squeteague Pond he saw a "plum pudding" fly across and alight in

THE TETONS FROM A HUNTER'S WAGON.

From a photograph by G. W. Ridge.

Gilbreth's Cove. It was easy to keep behind a stone wall until he reaehed some low sumacs that would screen him until near enough to shoot. The bird flew up sooner than he expected, but within possible chanee, and he tried a long shot, wing tipping it. Avoiding its spiked bill, he secured it without further injury, and tucking it under his arm, kept on his way.

I have said he was a born gunner, and had it in his blood. Such men love a joke that relates to their sport. He thought of a capital trick to play on one of the other boys at the shanty, so keeping out of sight from it till he reached a favorable spot on the shore, he put the bird between his knees while he searched his pockets for a string. Finding some he tied one of the birds' feet to a short stick, whieh he then thrust well into the ground. Leaving the bittern there, he went on to the shanty.

The game of seven up was in progress. Lombard had just dealt, and it was Louis Lander's beg when Sumner came in. "Where's your fowl?" they all asked. "Didn't get it," he replied. "Heard you shoot," said one. He put away his gun, took off his wet coat and drew up to the stove and watched the card players. After waiting a reasonable time he rose and went to the door, remarking: "I believe its letting up, boys." Going out he walked a few steps to where he could see the bird standing by the peg as he left it. The others had followed to the door to see how the weather was. This was what he wished, and affecting a cautious stoop, he drew back toward the building, saying: "I see a hern." The others took a cautious look and Lombard went for his gun, saying: "I'm going to get him, boys."

When he came out, gun in hand, the others began to advise him how to approach his game. "You'll have to crawl across Handy's field and keep the bushes in range of him," they said. Off he started in a half bent slouching walk along the wall until he hid the bird behind the bushes. Then he began a tedious crawl across the field, the wet grass adding to the unpleasantness of it. At length he reached the bushes and carefully worked through them, the boys in a group watehing with an interest that Sumner's evident excitement in no wise lessened. Presently a shot rang out and the bird collapsed. Lombard burst through the screen of brush in front of him and ran up to his game. Not heeding the fastening he snatched it up by a wing before making the discovery that it was tied to a peg all the time.

A loud shouting from the crowd about the shanty assured him that the joke was appreciated.

WALTER B. SAVARY.

Aeroplane Duck Hunting.

SAN FRANCISCO, Cal., Dec. 30.—*Editor Forest and Stream:* The California duck season, owing to the continued lack of rain, has not been a great success so far, but the duek hunters are taking a lot of interest in the proposed air ship hunting of ducks. So far as known only one duck has, as yet, aetually been killed from an aeroplane, but plans are under way for at least one other attempt. Hubert Latham, the Freneh aviator, who is at present in Southern California, has the honor of bagging the first duck from an airship, a bluebill, which he brought down with the first shot on Dee. 22 on the game preserves of the Bolsa Chica Gun Club on the oeean shore fifteen miles from Los Angeles. Latham secured permission from the elub to make a try at the ducks from his Antoinette monoplane, and left the aviation grounds at Los Angeles shortly before noon. He eovered the intervening fifteen miles at about a mile a minute. After flying along a lagoon for a half mile or more without getting a fair shot, he made for the ocean and headed for a big flock of dueks which had fled from the lagoon. A few hundred yards from the shore he hazarded his first shot, bringing down a bluebill which fell into the water and was fished out by the club members present. Latham then pursued the ducks to sea for a mile or two and back again, shooting oecasionally, but without further success. The ducks were quicker on the turn than the aeroplane, and either altered their course or flew high in the air whenever the pursuer got within shooting distance. Altogether about a dozen shots were fired by the aeronaut before he gave up the sport and alighted in the yard of the club house at Bolsa Chiea.

During the coming week F. E. Scotford and Paul W. Beck, of San Franciseo, ehairman and seeretary, respectively, of the Business Men's Aviation Committee of San Franeisco, will be taken on an experimental goose hunt in the Sacramento Valley by R. R. Young, representing the Curtiss Bi-Plane Company, and Roy Knabenshue, of the Wright Company. Local hunters believe that the geese will have a harder time dodging airship hunters than the dueks had.

The duck season is still decidedly backward, and while a few good bags are seeured most of the local shooters have only moderate luck. The lack of rain seems to be the cause of most of the trouble. The wildfowl are still confined to the marshes and sloughs and to the game preserves, and continued shooting has made them deeidedly wild in most loealities. Along the San Francisco Bay marshes the hunting is probably holding its own as the season advanees, but there is practieally nothing doing at the inshore shooting grounds. Canvasbacks and bluebills have been most abundant. Sprigtails have nearly all left the Alameda marshes, but spoonbills are beginning to come in and are in fine condition.

Goose shooting is now good in many localities in the interior of California. In the counties of Glen, Colusa and So'ano in the Sacramento Valley the plains are alive with them. There is no limit to the number of these that may be killed, and some large shoots are reported. One shipment that came in to the San Francisco market, including bags from Colusa, Maxwell and Willows contained over 1,000 birds.

A wildcat weighing forty pounds was trapped in Golden Gate Park last week by a boy, the nephew of Prof. Barron, the curator of the park memorial museum. The eat had been destroying quail, rabbits and other small life in the park for three years, and many attempts to take or kill it had failed. The boy finally rigged a plain box trap baited with fresh meat, and succeeded in catching the intruder. After examination the animal was pronounced by the experts a hybrid wildcat.

All the game laws of the United States and Canada, revised to date and now in force, are given in the Game Laws in Brief. See adv.

About Foreign Game Birds.

BRIDGEPORT, Conn., Dec. 10.—*Editor Forest and Stream:* The mania for the importation of foreign birds for Ameriean shooting still continues in this State, and I wish with all my heart that our publie here would come to their senses again and see things as they really are.

Recent numbers of FOREST AND STREAM, and especially the quotations from the new book, "American Game Bird Shooting," have more or less explained the odd mental attitude which is at the basis of this craze.

Gunners in different States who pay money for lieenses are disposed to insist that a portion of this license money be expended in the purehase of birds that may be shot, and at the present moment the bird in fashion is the European partridge, more commonly known as Hungarian partridge. These birds cost $6, $8 or $10 per pair, and, if turned out and shot, each bird killed costs the State $3, $4 or $5. To be sure not all the birds are shot at once, but sometimes are cared for over a season or two in the hope that they will multiply. In some cases it is reported that they are shot almost immediately; in still others, the birds are received in poor condition after a long voyage, are turned out weak and little able to care for themselves among strange surroundings, and soon disappear, falling a prey to wild animals, to hawks or to the elements.

I recently talked with a man who has had much to do with receiving and putting out these birds, and from him received considerable enlightenment as to the way in which they reach this country.

It appears that the birds come in large crates five or six feet square, but very low—less than a foot high. These crates are slatted at the sides, have solid board floors and are covered with ordinary bagging or gunny sacking. Each crate holds eighteen or twenty birds, and each is commonly divided into six compartments, so that there are only three or four birds in each eompartment. Around the outside of the crate runs a little trough for food and water. These crates are packed for shipment one on top of another, perhaps five in all, and are then inclosed in an outside crate which holds them firmly at the corners. Each of these large collective crates then is likely to hold from ninety to one hundred birds. In placing one of the small crates on top of another, it is evident that the floor of the top one would be immediately against the bagging cover of the one below, and that birds dashing themselves against this sacking cover would practically be dashing themselves against the boards of the crate above. To provide against this probability of injury, the packers place over each compartment of each inferior crate a little whisp of straw, rolled or tied up, so as to keep the sacking away from the solid boards above it.

These birds, thus crated, are often five or six weeks on their journey. Confined in this small space, they become very foul; they jump about in their small quarters, and when frightened throw themselves against the roof of bagging. Frequently this roof of bagging is worn through by this action, and as this wearing takes place, gradually long threads of the sacking begin to hang down into the birds' quarters. These strings or threads often get wound about their legs, heads and wings, sometimes killing the

birds, sometimes only crippling them, breaking a leg or crippling a wing. It seems obvious that wild birds subjected to conditions like these are not fit—and will not for a year or two be fit—to take care of themselves and to propagate their kind. Persons who are purchasing these birds are perhaps not expected to pay for dead ones, but so far as practical use goes, many of those paid for and turned out might about as well be dead.

Now to spend money for such material, or to spend much money for birds, even if in good condition, to be turned out to be shot, appears to me extravagant and wasteful. The average gunner does not realize that the birds turned out cost as much as they do. He pays $1, we will say, for a license, and the other $2, $3 or $4 paid for the European partridge come out of somebody else, and pass through the hands of the States, so that the individual gunner feels that what becomes of it does not concern him. The State authorities are not greatly to blame in the matter. They feel obliged to do what the gunners urge. But if a small fraction of the money expended for foreign birds had been devoted to experimenting with our native species in trying to rear them in domestication, we should probably be far better off as concerns birds, and no worse off as regards money.

While it is true that there have been many reports that European partridges turned out have done well and bred, people who have made a business of looking after the matter feel that these birds have not done well, and that in cases where they have bred, there has been little or no increase over the first brood, and the supply remains stationary or gradually dwindles away.

Some States have spent large sums of money in purchasing game farms, where the authorities attempt to rear pheasants, European partridges and other foreign birds, but, so far as I am able to learn, the success with none of these exotic species has as yet been sufficient to justify the great sums spent on them. They continue to be called for, but this only shows the thoughtlessness of those people who, hearing of great bags of game killed on estates in the old world, imagine that there must be something peculiar about these foreign birds, and that if brought here they will give better shooting than our native species. An editorial which appeared not long ago in FOREST AND STREAM dealt with the cost of shooting in England and was illuminating.

We in America would much better devote our attention to experimenting with our native birds, trying to rear them in confinement, and then turn them out in regions to which they belong, and where they would be obliged to contend only with the dangers to which their ancestors have always been exposed.

It seems to me extraordinary that the Americans, who profess to be practical people, should consent to see their money frittered away on such foolish schemes as this. When we see this happening, we are not surprised at the success which crowns the efforts of the various get-rich-quick concerns that prey on the public.

Hunting in Southwest Texas.

AFTER a few days' planning and preparation, a party consisting of W. E. Wills, R. G. Decker, Percy Reid and myself, with Severanio Rivera, a Mexican cook, left Corpus Christi, Texas, on Oct. 31. At San Diego, a station fifty miles west, by previous arrangement, Lee Ademi met us with a big wagon and buggy; when we were ready to start for the Ademi ranch, the mules furnishing amusement for the people of San Diego by stalling. The mules listened to a few encouraging words and made a new start and we camped for the night at a lake twelve miles out.

In the morning Lee Ademi and Dr. Wills took the buggy and went on to the ranch after a wagon, as the country was hilly and the load

BRINGING A BUCK TO CAMP.

too much for the mules. Our wagon also started, leaving Percy and myself behind to hunt for ducks on the lake. After getting several, we overtook the wagon and learned that Decker had shot at a coyote but did not get him, while "Bill," as we called our cook, had seen several deer.

During the day we killed a number of bob-white and California quail, and met three typical ranchmen with their six-shooters in view and eyeing us with suspicion. Just as we were about to camp for the night, Lee returned with another wagon and team. While unhitching, some one struck a match and off went the old tired mules in a hundred-yard dash, but as they were tied together, they were easily caught.

As we sat around the camp-fire, Bill gave us an account of some of his adventures with javelins [peccaries] and declared he had heard them snapping their teeth in the brush around the camp. At three o'clock we started for the ranch and about sunrise Bill wounded a large buck but did not get him.

Arrived at the ranch about noon, we were met by Gordon Ademi, who had killed a fat calf and had a good ranch dinner prepared for us and everybody did justice to the occasion. While there, Mr. Ademi told us of his father's early days on the ranch, his trouble with the cattle thieves, and the murder by cattle thieves of his two sons, Walter and Milus.

This ranch, owned by Mrs. Wm. Ademi, contains thirteen thousand acres of land. It is mostly hilly with a few miles of prairie around the ranch house, and two creeks running through it. The hills are covered with brush.

After dinner we went to the branding pens, which furnished amusement for the cowboys and ourselves. To the person who has never seen the cowboys branding, it is certainly worth the price of admission. Later we went to our camping ground near the ranch. We pitched our tent on a creek, near which could be found deer, javelins, coyotes, badgers, raccoons, quail, rattlesnakes, wildcats and a few Mexican lions.

We made an early start the next morning, Dr. Wills armed with a gun and Decker, Percy and myself with rifles, but luck was against us; Dr. Wills saw three deer and Percy four, but neither fired a shot. However, Dr. Wills and Bill caught some nice fish for supper.

I had not hunted more than fifteen minutes the next day, when I heard a deer run and stop. Being too anxious to see him, I stepped on a dry limb and away he went. Later I heard another one, and profiting by my former experience, I sat down and waited. A small buck went sneaking through the brush, and when the smoke had cleared away, all hands came up and decided it was a case of suicide—the buck was so poor. I saw another buck which I shot. He was not large, but was in good condition.

One day we hunted quail. Percy and Decker started a coyote and shot him six times. He pitched like a broncho, but the shot were too small to stop him. When we had killed about fifty quail we returned to camp.

One morning early Bill and I started for the hills, leaving the others asleep; there is no place like the hills to hunt. After leaving Bill, I saw a doe and heard a buck whistle; but the brush was too thick to see them. I was hunting on the side of a hill covered with prickly pear and brush, a favorite place for deer, when out jumped the largest buck I ever saw. I fired three shots before he got out of sight, and knowing that he was hard hit, followed him about seventy-five yards, when he fell. After Bill came we opened the buck, put him on a pole and started for camp; but a mile was our limit, so we hung him up and went to the camp for help.

The next morning, before day, we were awakened by hearing Bill sing out, "The coyotes stole the deer liver!" Decker had not killed a deer, so he left early with Dr. Wills. Percy's feet were tender, so he slept. At noon we heard a shot. Going out, we found Dr. Wills and Decker each with a deer. Decker killed his running early in the morning, marked the place where he left it and went after another. As the brush was thick and it was very foggy, he could not find his deer and started home. Hearing Dr. Wills shoot, he went to him and found him lost with a deer. On their way to camp Decker found his mark and deer.

Tuesday morning Lee came over to hunt with us. He went to the hills, and when he re-

turned at night, he had a total of five javelins. In the afternoon Perey shot at a big buek running, but did not get him and brought in a large rattlesnake for a substitute. That night the dogs stayed in eamp and kept us awake barking at eoyotes that were after more deer liver. Every night and morning we eould hear the unearthly howls of eoyotes. Lee set some traps while at eamp, eatehing five.

One afternoon, Lee, Perey and myself started on a javelin hunt with Mocho, a red bob-tailed hound; Fido, a blaek ring-necked hound; Beulah, a half bull-enr, and Coley, a brown hound. After going about a mile, the dogs started several javelins, which turned and dodged all the dogs exeept Mocho, who went out of hearing, as the wind was very strong. We waited for him until nearly sunset. On the way to camp, Fido started a young sow. Beulah and Coley joined in. Coley, a young hound, was always behind barking as loud as he eould. After the dogs bayed the seeond time, Lee and I saw the javelin but eould not shoot for fear of hitting Percy. It was nearly dark when the dogs bayed her for the last time and I stopped about fifty yards from her, as the brush was very thiek; Lee went in and shot her. The dogs were on her, but only for a moment, as she was not badly wounded. She started for Lee, who fired again and missed but finally killed her. Mocho eame in about nine o'clock slightly wounded.

Dr. Wills, Lee, and myself were off early next day on horses, so we could keep up with the dogs. When we had gone a couple of miles the dogs started a bunch of javelins, running them about a mile and then baying. Going to the dogs, we heard Coley yelp, and Lee remarked that a javelin had killed Coley, but we would go to the other dogs first. On arriving, I saw a large javelin run at Mocho, biting him through the ham. It turned and came within ten yards of me, its teeth snapping all the time; I started to shoot, but Lee shouted, "Don't shoot, you might kill my dogs." Lee finally killed the javelin.

Carrying Mocho and the javelin to the horses, we found Coley, whom Dr. Wills examined. The poor dog had received no wounds but was only frightened. As he had been cut very badly a few weeks before, his actions were exeusable. Dr. Wills took the javelin on his horse and Lee took Mocho. He looked so pitiful that I swore I would never hunt javelins with the dogs again. Lee certainly thought lots of his dogs beeause a faithful old dog had saved his life twice in one night. While camping he was awakened by his dog backing up on him and growling. Striking a match, he found a large rattlesnake near him. Early in the morning the dog had a fight with a mad coyote near where he was asleep. The coyote escaped after biting the dog, who never got over it.

We spent the afternoon bathing in the creek and shooting quail, as the bucks were driven away by the dogs. Dr. Wills killed a large rattlesnake, and after skinning him, made about five ounees of rattlesnake oil, which he tried to get Bill to put on some quail that he was broiling; but Bill positively refused.

The last day of the hunt Deeker and I were the only ones to go out. I had heard of red shirts hypnotizing deer, and as I had my limit, I was anxious to experiment for future knowledge. After hunting a while I made for the hills to see what effeet the shirt would have on things. But after stampeding two herds of eattle I returned to eamp. I am through with red shirts for all times.

That day we broke eamp and returned to the ranch house. There was not a day in the hunt that we did not have venison, javelin, quail, fish or dueks, and everbody enjoyed the outing.

D. A. Segrest.

A Taxpayer's Plea.

Philadelphia. Pa., Dec. 29.—*Editor Forest and Stream:* While a majority of thoughtful sportsmen probably agree that the lieense system as now in effeet in most States is a wise provision, many contend that some of the rough edges might well be taken from the law, as far as non-residents are eoneerned, without impairing its effeetiveness. Partieularly is this so in regard to New Jersey, the summer play ground of many city residents who are also quite extensive owners of summer homes and real estate, but whose voting residence may be just over the line. Should such a person desire to spend a few days gunning with his country friends he is taxed $10.50, notwithstanding the fact that he is a heavy taxpayer, and the resident pays $1.15 for the same privilege and perhaps pays not even a poll tax. It would seem that a just course would be to let a non-resident in on the basis of a resident if it eould be shown that he had paid loeal taxes equal to or exeeeding the $10.50. It might be urged that this method would involve great expense and considerable extra work, but when it is noted that the very official who issues the license—the county elerk—has all the data right at hand in his office to establish a claim for exemption, this objection loses weight. A tax receipt accompanying an application would also be a simple and direct method.

I doubt if the State treasury would lose a penny were this system adopted eompared with the few that are now eollected at the full rate. And besides it would tend to promote a feeling that the game resources were not being exploited for revenue only and would enlist more people in the eause of seeing laws enforced rather than trying to evade them. Public sentiment is far more powerful than game wardens, many of whom are decidedly lax, not to say lukewarm, when it comes to questioning friends and neighbors as to their legal standing as to killing game. This was shown in one instance where a noted huntsman in one of the shore eounties killed a fine buek deer and then immediately started for the county seat to procure a license, although he had previously been gunning every day. I am sure no real sportsman would object to paying a dollar to help improve the sport he loves, but when it comes to doubling the cost of a day or two in the field or in the blind by paying the non-resident license tax in addition to heavy taxes on other local property, many very good citizens differ with the men who claim to have the welfare of the gunner and effective preservation of game as their chief object.

All the game laws of the United States and Canada, revised to date and now in force, are given in the Game Laws in Brief. See adv.

Deer Hunting in Arizona.

Ash Fork, Ariz., Dec. 20.—*Editor Forest and Stream:* This part of Arizona is unsurpassed for fine climate. Altitude at 6,000 feet, the air is clear and erisp and one wants to be outdoors all the time. One eannot get enough to eat, and it is simply a joy to be alive.

I am hunting on Reid, Evans & Co.'s eattle raneh, about twenty miles northwest of Ash Fork, in the foothil's of the Floyd Mountains. It is an ideal eountry for deer. One of the cowboys, John Markham, showed me the eountry where a buneh of deer ean usually be found.

The first morning I was here I took my .35 automatie, and with a few extra elips of cartridges in my poekets, started for the cedar brakes about a mile and a half southeast of the raneh house. It was raining and had been for two days, eonsequently the ground was soft, but not enough to interfere with hunting, and made one's steps almost noiseless, a big point in favor of the still-hunter.

I struck out at a merry clip for a ridge, and about half way had to stop and eateh up with my breathing. I had forgotten the high altitude and was going at my accustomed gait while in a cornfield in Oklahoma shooting quail. The walking was fine, however, and the only time I have felt dead tired was after tugging and lifting a big blacktail buek which I had killed and gotten to eamp.

After that I filled my pipe, sat out on the steps, looked back over the distant snow-covered peaks of the San Franeisco Mountains and wished for one of my old shooting companions. These blacktails are big deer. One has a right to feel tired after he has brought one of them in on a horse, hung, skinned and cut it up all by himself.

Going through a small pateh of scrub eedar, a big jack rabbit hopped up about sixty yards away, sat on his haunches and eyed me until I was sorely tempted to see just what a high power bullet from the .35 would do for him, but I knew that it would not do to mix jack rabbit shooting and deer hunting. The next eedar-eovered ridge was a half mile across the smooth open valley that usually is to be found between the ridges, and it was on this ridge that many tracks had been seen the evening before. The eowboys had told me that one had to live here for several months before he eould see a deer standing among the eedars before it started to run, consequently I was very watchful and was using all the deer hunting sense I had gained in the past years of hunting the whitetails, going very cautiously, creeping to the edge of open glades and standing and looking over everything and every place that looked like it might hide a deer. When I had about reaehed the top of the ridge a movement off to my left caught my eye, and like the trained pointer I "froze" instantly. There he was, but I eould see nothing but just that enormous head of horns and those big ears facing me, and eould not tell whether he was beyond the ridge from me, as he was partly hidden by the barren limbs of a fallen cedar, and as he was not more than eighty yards away, I instantly deeided that I would have to risk a shot at his head. But as I shifted the rifle to raise it, he leaped to his feet, having been lying down all the time, gave one great leap, and as he went up in the air the rifle

cracked and he stood on his head just like a small rabbit killed with a shotgun.

As this buck went down, another big one jumped right over him and dodged to the left out of sight under the cedars, and I could get no other glimpse of him. Both had been lying down and were the only two there. I followed the tracks of the second buck on my way back to the ranch for a horse, old Red Bird, and found where several other deer had joined him inside of a hundred yards. My buck never knew what hurt him, for the bullet caught him in the back of the neck as he leaped for cover, smashed the bone into little splinters, cut the jugular vein and came out in a half dozen pieces all along the side of his jaw and under his throat.

This deer weighed nearly 300 pounds, but that bullet had the same effect on his great bulk as striking a kitten with a club. This rifle was made to order and is a very handsomely finished gun. It has terrific striking force and I do not think there is any animal living that could stand up in front of it for five shots. I had it fitted with a gold bead front sight and a peep, and open sights also for the rear. This gives any kind of sight a hunter could wish for for the rear, and as for the front sight the gold bead cannot be beaten. Personally I always use the peep in combination with the regulation open rear sight, and have never been bothered about "finding" a running deer or even a rabbit through them. I have used this rifle on everything I have killed here—deer, rabbits, ducks, hawks, big owls and coyotes—and it kills them all with never a kick or struggle on their part. I have used nothing but special bullets and it is simply wonderful the way those bullets tear up an animal. They are, or appear to be, just the ordinary soft nose bullet except that in the nose there is a small steel shot, and it is this that causes them to mushroom so well.

This is my first experience in hunting blacktail deer, and I believe the whitetail are far and away more difficult to get to. Then the chances for a good shot are much better here. These deer are not hunted and I have had no trouble in getting my limit of big heads. Usually in hunting the whitetail deer his big, white tail is about the first thing you see of him, while these big fellows are as easily seen as a cow if you know how to look for them. They usually stand for a moment and look at a man on foot, then dodge into the cedars. These cedar brakes cover the ridges, and the valleys between are perfectly smooth and generally free from breaks or draws and also from rocks, yet there are some very deep, rocky cañons whose sides are so steep that nothing but a goat can go up or down them. Water is the great and crying need of this country. There are no running streams or springs except in widely separated places. The cattle men have to build immense dirt tanks which catch the winter snows and rains. They build them big enough to hold water for all the cattle of the range for a year without rain. Of course the deer and all wild animals come at night to these big tanks for water and never go more than a few miles away from them in the day time. But let heavy rains fall and put water in the cañons and draws back in the rough country, and in two days one cannot find a cow or deer in a five-mile ride of the ranch where there were thousands before. They have gone where the range is good in the country where it is impossible for them to stay except in the rainy season.

Ranch life was always very interesting to me and the cowboys are about the finest fellows on earth if they like you, but they can make life very miserable for a fellow they do not like.

Of course I saw the Grand Cañon of the Colorado River, and of course I am not going to attempt to describe it. If you have not seen it, too, why, do not die until you do see it, for you will die much happier. I could sit on the rim and gaze into it for six months without leaving if someone would just bring my meals to me. As one walks up to it, it seems as if the whole half of the earth has fallen off there in front of you. There were several young women from Philadelphia chaperoned by an elderly woman and her husband, and these young women were in a party that went for a drive several miles to a point from which a splendid view of the cañon is to be had. The guide and I were the only men in the party, and one of the girls fainted while returning up the trail down which we had been for a better view under the rim. Well, of course the guide and I promptly took the little thing in our arms, carried her to the top and gave her some whiskey which revived her. This guide told me women often fainted. It is just a bit hair-raising to look off where you could drop at one step for several thousand feet straight down.

My stay is about over and I will leave with keen regret. On the ranch here are some of the finest young fellows to be found in the world. Genial, warm-hearted, good-natured and afraid of nothing, they take chances every day that would appall an Easterner and seem surprised if one mentions it. I was raised on a Texas cattle ranch and know the game, but it has a fascination for me that is irresistible.

LEROY E. NABERS.

Sportsmen's Clubs.

THE Sportsmen's Association of Rensselaer county has been organized in Troy, N. Y. Among its objects are the protection of game, the prevention of snaring, and the enactment of safe and sane game laws. Dr. T. A. Connolly was elected President; J. J. Farrell, Secretary, and W. C. Feathers, Treasurer.

THE officers elected at the annual meeting of the Norristown (Pa.) Fish and Game Protective Association are as follows: Alfred Craft, President; H. G. Unger, First Vice-President; George H. Steinmetz, Second Vice-President; David Allabough, Third Vice-President; Louis B. Boyer, Corresponding Secretary; John P. Reiff, Recording Secretary; Norristown Trust Co., Treasurer; Norris D. Wright, Assistant Treasurer.

THE Blue Mountain Fish and Game Association has been incorporated in Berks county, Pennsylvania. Its intention is to maintain a fish and game preserve at Hamburg. The directors are from Reading, Hamburg and Allentown.

THE Niangua Fish and Game Association has been incorporated by sportsmen of St. Louis, Jefferson City and Kansas City, Mo. A preserve will be established in Camden county, that State, and stocked with game and fish.

Shall Hunting Dogs Go?

THE following editorial from the Watertown (S. D.) Opinion gives a hint as to one of the radical changes that may be advocated if present protective laws are not made more effective:

As the time for the next Legislature to get busy approaches, the suggestion that the game law be so changed that chicken shooting be permitted, but without the use of dogs, is coming to the front. This proposition has been considered for some time past, and while at first glance it seems almost an absurdity, it becomes more reasonable with more study.

Sportsmen who have fought long and hard for the laws that are preserving the game in this State will think more of the proposed change if they give it the attention it deserves. Of course hunting chickens without a dog sounds very similar to no sport at all. It is conceded that much of the best sport of chicken hunting is derived from the pleasure afforded in watching the dog work. Yet the first consideration in all legislation of this kind is the preservation of the game, and the object is to afford some hunting now and some in the years to come.

If the chicken season is opened again next fall, say for fifteen days, and it will scarcely be for fewer days than that, and dogs are permitted, what will be the result? For weeks before the first day every gunner in the country will be priming himself and his outfit to get the most out of the time the law allows. The summer will be planned so that the ardent sportsman can take his vacation in those fifteen days. As a result the fields will be searched and researched in that time. The game fields will be raked with a fine tooth comb, and because there are now chickens in fair numbers there will be good kills. The result then will be that what chickens are here now will be killed off faster than ever before, because of the increased number of hunters and the desire to get all there is out of the limited time.

Arguing along this line still further, one season will cause the disappearance of all the surplus of birds that has been reared during the past two years' of protection, and the second year would reduce the number to fewer birds than there were when the protective law was enacted two years ago.

But without dogs the hunters can make no such slaughter. Without dogs they will make no such elaborate preparations for the chicken season. But they can do this: On their hunting excursions for other birds they can sandwich in some time looking for chickens. When they discover a bunch here or a bunch there by accident or otherwise they can enjoy the pleasure of getting a few for the frying pan's sake. They can take a crack at those that fly over night and morning when on the slough or the pass without a pang of conscience. In short, they can have a chicken now and then, which is about all the future sportsmen of South Dakota can hope for.

Yes, hunting without dogs seems reasonable after all when the proposition is considered from an unselfish standpoint and with an eye to the best welfare of the State in the future, and the fun of the next generation, which considerations are the chief aims behind any game protective law.

Fines for the Reckless.

Boston, Mass., Dec. 31.—*Editor Forest and Stream:* Hon. J. W. Brackett, chairman of the fish and game commission of Maine, has been doing some thinking on the subject of preventing the accidental killing of hunters while in pursuit of big game. He suggests in his annual report that the man who shoots another while hunting be required to pay a heavy fine for the benefit of the family of the victim. He would also dispense with the investigations of coroners' juries, believing them to be a serious hindrance to county attorneys. He declares that the verdicts rendered by such juries have usually ended all proceedings looking to the punishment of the guilty persons, notwithstanding the statute provides that these cases be investigated by county attorneys. His plan is to have such cases go directly to the grand jury for investigation. His reasoning is that if the hunter realizes in advance that he must pay a heavy fine if he shoots a man, he is not likely to shoot at every moving twig.

The commissioner's theory is that the offender fires without seeing anything but moving bushes, and in his intense anxiety to shoot a deer he is wholly oblivious for the moment of the danger to human life. The certainty of being obliged to pay a heavy fine would seem to be reasonable punishment, but if insufficient, it might very well be supplemented by imprisonment. It is certainly for the advantage of all parties interested that the inexcusable killing of human beings be brought to an end.

I am confident that not a few sportsmen have been deterred from making trips to Maine for big game because of the numerous cases that have occurred in the past few years of hunters being shot. Many of the Massachusetts hunters who formerly hunted in Maine prefer to go to regions where game abounds and the woods are not "full of hunters" as they express it.

Raymond Whitaker, a young man residing in Lynn, is now in the hospital of that city as the result of exposure while hunting in the White Mountains. He started out from Jackson with a companion named Linberg. They were lost on Doublehead Mountain, a spur of the Presidential Range. They came upon tracks of several deer which they followed, and in crossing a stream Whitaker fell in and was obliged to pass the night there endeavoring to dry his feet by a fire that they kindled, but not a good one, as they could only get small branches and twigs with which to keep it alive. The next day he was obliged to walk nine miles with frozen feet, the mercury being ten degrees below zero. He was able to get word to his father in Conway where medical aid was obtained, but was told that his toes would have to be cut off, and for that purpose he was sent to the Lynn Hospital. Whitaker says he supposed when they started into the woods that his companion knew the way.

H. H. Kimball.

The Chickaree's Mistake.

Three men working in the woods near here witnessed a most unusual spectacle a few days ago, says a Montreal Herald correspondent. They were engaged in cutting wood when a partridge hopped out of the bush and stood motionless a short distance from them. The men ceased work and watched the bird. Just then a red squirrel came out of his den and began chattering. A dog which had accompanied the men to the woods heard the squirrel and made a dart toward it. The little animal gave a frightened glance around, and espying what he took to be a stump hopped on top of it. The motionless object proved to be the partridge and it immediately rose up and flew away, carrying the squirrel with it. The astonished choppers watched the unusual sight until partridge and squirrel disappeared from view, but how far the partridge carried this strange burden they could not ascertain.

Ducks Abundant.

New Orleans, La., Dec. 31.—*Editor Forest and Stream:* Two large hunting parties are expected to arrive here from the North and East within the next ten days. One party will come from Philadelphia, headed by Sidney G. Fisher and Mr. Pratt, the other party from Milwaukee. The visitors will spend some time hunting ducks and other game in the vicinity of Lakes Charles and Arthur, Louisiana. Thousands of ducks, geese and brant are around Lakes Arthur and Charles, and a number of hunting parties from New Orleans and elsewhere are enjoying the sport. Ducks are also plentiful at The Jump near the mouth of the Mississippi River. Recently Mr. Grunewald, of this city, had for his guests Councilman J. J. Frawley and a party of visiting friends on his yacht Josephine. They spent several days at and near The Jump and came home with numerous wild geese and ducks.

A large pair of black mallard ducks are being exhibited at the store of Henry Martin & Co. on St. Charles street. They were killed near Lake Arthur by R. B. Worthan. They are the largest and handsomest mallards seen in this city in years. Ducks are plentiful in the marshes and lakes on the Louisville and Nashville road between New Orleans and Bay St. Louis. Harry Farwell entertained a large party of friends on his houseboat on Bayou Barataria recently. The party succeeded in killing fifty ducks and landed a number of large redfish. The party spent four days fishing and hunting.

A number of complaints have been registered with the State game commission by hunters against the railroads. It is stated that roads will not allow hunters to carry their game in the regular passenger coaches and will require them to place their game in the baggage car. It is claimed this is quite an inconvenience, and it is probable the hunters will file a petition before the game commission asking for a ruling. It is likely, however, the commission will hold that this is a matter for the State railroad commission to settle.

Commissioner Miller is enforcing the rule vigorously in regard to requiring all shipments of game to bear tags descriptive of the number of game and character and where and when killed and by whom. The hunters are furnished daily with tags, and if they do not employ them they must take the consequence. Several large shipments of game have been confiscated by the game wardens and sent to various city hospitals on account of the failure to tag the game properly.

Quail are plentiful this season and wild turkeys are abundant. It is thought the number of deer killed up to date will not equal the record of last year.

F. G. G.

New Publications.

American Game Bird Shooting, by George Bird Grinnell. Cloth, 575 pages, illustrated, $3.50 net. New York, the Forest and Stream Publishing Company.

"American Game Bird Shooting" is the latest work from the pen of Dr. George Bird Grinnell, author of many books, notably "Pawnee Hero Stories and Folk Tales," "Blackfoot Lodge Tales," "The Story of the Indian," the Jack Serics, etc., and his more recent authoritative shooting work, "American Duck Shooting," which has passed through several editions and bids fair to pass through many more.

The modest title, "American Game Bird Shooting," falls far short of conveying an adequate idea of the real scope of this book. The same comment, with equal pertinency, holds good in respect to "American Duck Shooting," since each work comprehends a complete ornithological account of the birds treated therein as well as descriptions of the methods employed in their pursuit and capture by the sportsman. Thus the two works are complementary, covering almost the entire field of game birds taken with the shotgun, with a complete description of their natural history features. The completion of this work was a large task, requiring exceptional qualifications, knowledge and experience, and was never before accomplished by any other author.

There is nothing extraordinary, nothing mysterious, in the success of Dr. Grinnell's books. He knows his subjects thoroughly. He is an accomplished naturalist, and therefore is fully qualified to write accurately and instructively on the ornithological features. He is a practical sportsman, with a long and broad experience in wildfowl and upland shooting East and West and North and South. Therefore, he writes from first hand knowledge, without which no writer can properly impress his readers, or hope for more than ephemeral success.

The average Eastern shooter, if asked to state how many kinds of game birds there are, would probably answer that there are five, the bobwhite, the ruffed grouse, the prairie chicken, the woodcock and the snipe, showing thereby a lamentable lack of knowledge on the subject.

Part I. of "American Game Bird Shooting," contains 282 pages devoted to thorough descriptions of the upland game birds, their habits and habitats. Seven species of American quail are enumerated and ten species of American grouse. Of special interest are the chapters devoted respectively to the mysterious woodcock and snipe, and to that most sagacious and alert of game birds, the wild turkey.

Part II. treats of the various kinds of upland shooting, and contains 167 pages of instructive matter as to sportsmanlike methods of capture. The cunning and strategy of the pursued in evading the pursuer, each species having its own peculiar methods, was learned only by close observation and long experience. He is indeed an accomplished hunter who does not acquire much new information on reading this work.

The matter of proper clothing and footwear is quite thoroughly treated—a subject of much importance, having to do with the comfort, protection and freedom of movement of the shooter, all so important in the success of an outing. He who has been crippled in the attempt to break

in new hunting boots or shoes will best appreciate the importance of good information on this point. The proper manner of dressing for the different kinds of shooting is told.

The chapter on guns and loads will start the novice right on these points from the outset.

As to hunting dogs—the pointer, setter and spaniel—thirty-seven pages are devoted to them.

Part III. is worthy of special perusal, for it has to do largely with game propagation and preservation. It follows the transition from the rifle to the shotgun, and the rapid decrease of bird life when the shotgun gained a permanent place as a weapon of destruction. The native American killed with no thought of how much destruction he wrought, and the alien killed all forms of bird life, caring nothing as to whether final extermination came or not. There is a recountal of the many attempts to introduce and perpetuate different species of foreign game birds, most of which were failures. The chapter on Destruction and Protection shows the numerous destructive agencies against which the game birds have to contend—the multiplication of shooters, cats, dogs, hawks, owls, all the carnivorous animals, and last but not least the encroachments of agriculture, all pointing to self restraint and enforcement of the game laws.

The work is profusely illustrated. The frontispiece is an admirable colored plate of the ruffed grouse, and a similar beautiful plate is devoted to the bobwhite. The originals are by Louis Agassiz Fuertes. The Canada grouse and the sharp-tailed grouse are illustrated by Audubon plates; in short, almost all the American game birds are illustrated and some foreign birds also, and some shooting scenes enliven the text. The illustrations number sixty-four. With the text, they serve to convey nearly the same thing as a visual study of the birds, while the shooting information equips the reader with the equivalent of years of experience.

SEA AND RIVER FISHING

Adirondack Trout.

NOT long ago in one of the magazines I came across an article by Stewart Edward White, entitled, "The Cabin." One chapter was devoted to trout fishing in the Rocky Mountains, and by way of comparison Mr. White described an Eastern fisherman who, for the first time, was trying his luck in Western streams. The article was a good one and thoroughly descriptive of trout fishing in the West, but I feel that Mr. White gave the idea that our Eastern trout streams are tame when compared with the more rugged streams of the Rockies. For this reason I am tempted to write of this glorious Adirondack country which ten years' experience has taught me to love so well.

First I shall tell you something about Phil. I met him the first year of my stay on Little Moose Lake. The first time I saw Phil he was squatted leisurely on a large birch log, unfolding marvelous tales to some of his fellow woodsmen, and, attracted by his picturesque appearance and his French-Canadian accent, I made my way to the edge of the circle.

Before many days Phil and I had become quite attached to one another, and since then we have spent many a night together in camp. Phil is a lumberman by trade, woodsman by instinct, and great romancer by inheritance, as Phil himself acknowledges. Phil is an interesting character. In the whole North country there is no better woodsman, and he is as much at home on water as on land. Never yet have I seen a craft capsize under his management, though we two have battled with some pretty rough water. Once we were crossing Canachaga'a Lake, the wind blowing a gale, but Phil pushed the little craft forward, apparently with no greater effort than he might have used had we been crossing a mill pond. Every wave offered a separate problem, and Phil worked out each one. A person with less experience would have swamped in an instant.

At one place I expressed some anxiety lest we should capsize and soak the packs, but Phil only grinned. "Meester," said he, "I lak tell you, you ees saf' in dees boat lak' you is in de Lord's pocket," and I knew that for once at least Phil had spoken the truth.

It has been my experience that one of the most exciting points in hunting is in locating the game, and I could never see much sport in fishing for trout where I did not have to find

RUSSIAN RIVER, CALIFORNIA.
On the San Francisco Fly-casting Club Preserve.

them first. Once we were camping on the Moose River, eight or nine miles above Little Moose Lake. Phil had prepared an early breakfast in order that we might start at the head of the upper stillwater before sunrise and fish down stream, reaching the Grindstone Rapids about sunset.

The break of day found us at the head of the upper stillwater, where I made a few casts among the boulders at the foot of the swift water, but the trout seemed small, so we moved on, drifting lazily with the current, while I whipped the flies slowly back and forth across stream, letting them flutter down as close as possible to the bushes. In the holes where ordinarily a big fellow might be lurking, we seldom got a rise, save for one or two small ones which were not thoroughly schooled in the art of taking the black gnat and the brown hackle.

Phil grinned, displaying his even white teeth beneath his bristly mustache. "I'd lak' for see one beeg one jump," said he. "Me t'ink you fin' de feesh in de spring holes dees tam.",

Phil was right. We soon heard the trickle of water coming from some invisible spot among the bushes, and after a careful inspection found a small spring pouring into the river thirty feet below us. Phil brought the boat to a standstill and I began to whip the flies toward the spring hole, increasing the length of the line with each cast. Finally the distance was measured and the flies fluttered gently down over the pool. They had scarcely nipped the water when the expected happened. I hooked a two-pounder and after a lively tussle Phil dipped him up with the net. I made several more casts, but in spring holes of this size one will seldom find more than one trout, although I have caught three.

At certain periods during the summer months the trout seem to take to the spring holes. It would be hard to make a definite statement as to the cause for this, but the most likely explanation I have heard is that during the summer months when the river is naturally warmer, the trout seek the colder water of the springs. This, however, is the case only in the still waters. In the rapids you will generally find the fish quite plentiful throughout the season.

We moved on down stream with the current, watching for the spring holes as we drifted, and it was not long before we came upon a second. This was similar to the pool we had just fished and the first cast was greeted with a splash. "By Gar'," said Phil, "dat was vaire beeg feesh!"

So it was, but he had missed the fly. I made several more attempts, but he would not rise again. This is generally the case in the smaller

spring holes, and only on rare occasions will a trout rise a second time if he has felt the point of the hook on his first leap.

We fished on down toward the Grindstone, whose rushing waters we could faintly hear in the distance, and before long reached the point where the Canachagala Creek flows into the Moose. Canachagala Creek was originally the outlet of the lake which bears the same name, but the outlet had changed its course and the stream, which now enters the Moose at this point, still retains the old name of Canachagala. The creek is approximately ten feet in width, and at the point where it enters the Moose, a long deep pool stretches off down stream for forty or fifty feet. We approached very cautiously, as the slightest motion would send the trout helter-skelter into mid stream. Phil pushed his paddle deep into the sand and brought our little craft to a standstill. My first cast was welcomed by three almost simultaneous splashes, and I hooked a magnificent trio. When three fish are hooked in this manner and each one is fighting in a different direction, the wisest plan is to land them as quickly as possible. In this case a fisherman will find that his landing net is a useless article, and Phil chuckled with delight as he tossed the trout one by one into the boat. The largest tipped the scales at a pound and a half, while the other two weighed about one-half pound each.

The supply of trout in the Canachagala spring hole seems to be inexhaustible and we spent a lively half hour there.

As we had planned, we reached the foot of the upper stillwater about sunset, and there below us lay the rushing torrent of the Grindstone.

As we had floated down the stillwater we had heard no sound save the occasional song of some bird, and in the distance the perpetual murmur of the swift water. The mountains had been less noticeable because they were separated from us by a strip of level timber land which stretched away for half a mile on either side of the river. Now that we had reached the Grindstone, the mountains seemed to rise abruptly into the sky, and the huge boulders stacked up on either side of the boiling caldron seemed to be protecting the mighty mountains from the onslaught of the rushing torrent. Here an enormous rock projected out into mid stream, and against it the swift river dashed and rushed on around the end, increasing in force as the stream narrowed. A little further down a tremendous boulder, stood alone in mid stream defying all the forces of the river to move it from its bed. As far as the eye could see, thousands of other boulders of various sizes and shapes were strewn about in the swift water, and it was among these boulders that Phil intended to guide the canoe, while I sent the flies dancing about into the pools and eddies which backed up on the down stream side of the larger boulders.

For an instant Phil held the craft on the brink of the swift water, then with one mighty sweep of the paddle he sent her dancing off down stream. "Bien," he cried, as he burst loudly into song, the only song I ever heard him sing. It runs like this:

"Come all ye jolly maids and sit ye down beside o' me,
Treat my daughter kindly and say ye'll do no harm,
And when I die
I'll leave you, all my stock and farm."

This is the only song Phil ever indulges in. I have heard it so often that I can tell just when the outburst is to be expected. For instance, when we are lounging about camp, or tramping silently through the woods, no one would ever guess that Phil knew how to sing. But let him push a canoe into the swift water where he is called upon to struggle against the forces of nature, and nine times out of ten the concert will begin. Physical exertion is the only power on earth that can coax a song from Phil.

Fishing in the rapids is very exciting sport; not only because you are constantly in danger of swamping, but also because the fisherman is called upon to bring his keenest senses into action. The splash of the largest trout is almost imperceptible in the swift water, and the expert fisherman will give his undivided attention to his flies.

The sun was fast setting in the western sky. Such a sky as no man could gaze upon, without fully realizing the power of the One who made it. Before us the mighty river swept furiously away, leaping and plunging into the distance until it appeared but a tiny silver thread. A hundred yards below, where the stream shallowed, a large doe stepped fearlessly into the rapids and started for the opposite shore. She was followed by two spotted fawns that pranced playfully at her side until finally all three disappeared into the underbrush on the other side of the stream.

We had now reached a portion of the river where the rocks were so numerous and the current so swift that we were forced to take the canoe ashore. The sun had already slipped behind Pico Mountain, and the remaining light was rapidly fading. We decided to make camp at this point, so Phil shouldered the packs and set off in search of a suitable location.

Like many other fishermen I am especially fond of the last battle in the twilight, so gathering up my flies I pushed my way through the swift water to the center of the stream. I was now wading knee deep, but as I had my eye on a particular pool which was still some distance beyond reach, I pushed on till my waist line had disappeared from sight.

Here the current became so swift that more than once I almost lost my footing. But by holding to a friendly boulder I was enabled to reach the almost inaccessible pool.

Splash! The king of the Grindstone had opened fire, and away he went down stream taking the line with him. The next quarter of an hour was a lively one for both of us, but the resistance was gradually growing weaker, until finally I lifted him into the net, a completely exhausted two-pound trout. Above the roar of the swift water I could hear faintly the notes of Phil's old song. And as I listened I could detect the dull ring of his axe as the blows descended in perfect tune to the music.

Turning wearily, my eyes fell upon the cheerful blaze of the camp-fire. Occasionally the odor of steaming coffee drifted across the night air, and the very breath of it seemed to put new life into my tired body. I made my way to camp, quite convinced that there was nothing tame about Adirondack trout.

Mark D. Dodd.

All the fish laws of the United States and Canada, revised to date and now in force, are given in the Game Laws in Brief. See adv.

Fishing for Steelhead Trout.

San Francisco, Cal., Dec. 27.—*Editor Forest and Stream:* This is the time when the fishing for steelhead trout is supposed to be the thing. The Russian River which empties into the ocean fifty or sixty miles north of San Francisco is the classic ground for steelhead, and for the past two or three weeks San Francisco anglers have been making pilgrimages to that stream. Some reports show good catches, but the last reports do not come up to anticipations. Evidently the big run has not yet commenced. Some fair fish, ranging in size from ten to twenty pounds, have been taken during the week. So far as reported Dave Sachs, of San Francisco, is high hook to date with a twenty-two-pounder to his credit. Outside of the Russian River there has been good steelhead and salmon fishing in the tide waters of Point Reyes and vicinity.

Salmon fishing is fairly good at several points, and the fish seem to be of unusual size this season. W. D. Fassett, superintendent of the Price Creek Hatchery on the northern coast, reports a seventy-three-pound salmon caught at Eel River last week, the record for that district so far as known.

Striped bass continue rather scarce in the waters about San Francisco, though a good deal of sport is had right along. The catches are uniformly small. Some good sized fish are caught, these ranging from seven or eight to thirteen pounds.

The California Anglers' Association will on New Year's Day move into its new club rooms in the Dunn Building at Stockton and Ellis streets, San Francisco. The club is considering buying the "White House" at White House Pool, in the tide waters of Paper Mill Creek, one of the finest fishing streams in the vicinity of San Francisco. A. P. B.

Fishing in the South.

New Orleans, La., Dec. 31.—*Editor Forest and Stream:* The weather has not been propitious for fishing during the past two weeks and very few have gone over to the fishing clubs on the L. & N. road. The various attractions incident to Christmas and New Years have militated against the sport to some extent. Numbers of redfish and striped bass and speckled trout have been landed, but this luck was only spasmodic and fishing as a rule has been quite poor recently.

The Game and Oyster Commission has decided to lease a total of 400,000 acres of oyster lands in Louisiana during January. No person or firm will be allowed to lease more than 1,000 acres for a term of fifteen years. The prices of the lease will range from $1 to $5 per acre. The best oyster beds to be leased are in the parishes of St. Bernard, Plaquemines and Terrebonne. It is believed that a number of firms from the North will come here and contract to lease a large number of the beds which are said to produce some of the finest bivalves in the world.

F. G. G.

It is all very well to propose a law restricting the number of fish a man may catch in a day, but what the average fisherman wants is some assurance that he will catch any at all.—New York Tribune.

"Well, Sir! Once—."

I.

I LOVE to sit on the dock, or pier, over salt water, and fish for any thing that can take a bait, while the good hot sun—best of all masseurs—irons the kinks out of my desk-drooped shoulders.

It is all good—the limitless distanee; the ever-changing restless, restful surf; the denizens of the air and of the deep and the good fellow with a story.

There will be days when the fish do not bite, when the sun does not shine, when the surf is listless and things generally fail to measure up to the desired standard, but never the day without the "Well, sir! Once—" man.

He may come to borrow your tobacco or lend you bait. He may bring or seek advice. He may be just loafing about in idle content, but when he eomes he will bring a story. You do not have to hear it; he will not insist upon telling it, but if you are decently polite and responsive, the truth—I should say the narrative—will out.

It may be, and generally is, about fish or fishing, but frequently sidesteps and takes other subjeets.

While not pressed upon you to the point of violenee at the outset, once begun it will be completed, though the interruptions be many and serious. Cateh a big fish, eut a finger half off with the bait knife or fall overboard, as soon as quiet is restored the story will go on from the very point of interruption.

I like these stories, and have heard many of them in years past, 'most all forgotten now, but some—and not always the best, or most interesting—have remained tangled up with the good, bad and indifferent things in memory's strange colleetion of odds and ends.

While fishing I was approaehed by that pest of land or water, Mr. Knowall, who proeeeded in a very eondeseending manner to give me unsolicited adviee and instruction. When he finally tired of the sound of his own voiee and took his departure, a little man sitting about two posts away, who had been a silent listener, hitehed along toward me and began:

"We'l, sir, once I was fishing down here on this dock, and a fellow like that eome along, and he just knew it all. Criticised our taekle; said we were not using the right bait, and generally made himself a nuisance. He finally stopped by a big man who was fishing with a light bass rod and silk line and having no luek at all. The big fe'low looked like the last man on earth it would be safe to fool with, but this well of wisdom went right at him. Told him his tackle was all wrong; his bait was no good; he was not in the right plaee; he was fishing on the wrong tide, and then gave a long lecture on the proper methods of fishing, fish, their habits and habitat. The big man said not a word until the fellow had about talked out, and then laying down his pole, said:

"'I didn't ask you for advice or information, but you have given me both, and you know so blamed much about fish I am ine'ined to think you are now out of your proper element, and I'm going to put you baek,' and before the astonished bore could move, snatehed him up and threw him twenty feet off the doek into deep water. We all rushed to the rescue and quickly fished him out, but he was through talking. All the way back to the shore the full length of the dock he dripped along without saying a word."

"Well, sir, once I ran up on a man of that kind over on the west coast and learned how to handle him," said a man who had eome up just as we began to talk, and had remained listening to my neighbor's story. "I used to get mad when they first took to butting in with advice and information and would eall them down, differ with them and waste lots of time and temper, but after the time I tell you about, when I learned how to handle them, I've had no trouble. An old fellow who really knew all about it was kind enough to take me in hand as a newcomer and show me how and where to fish. We were making preparations to go out on the dock to fish, and my friend had rigged me up a strong hand line—about all they used then—and was fastening a big hook on the end of a pole to lift the fish, when we pulled them up to the dock. While we were at work two tourists eame along and stopped to look on and give instructions.

"'I say, my good fellow, you should set that hook a bit lower,' said one of them.

"'Yes,' said my friend.

"'Turn it around with the bend the other way,' commanded number two.

"'Yes,' said my friend, going on quietly with his work.

"'Drive a nail through the eye and into the wood,' was the next order. Followed by number two with: 'Cut that barb off when you get it fast.'

"'Yes, yes, quite right,' said my humble teacher.

"This went on until I was mad enough to fight, and only the quiet way in whieh the old man took it all kept me from calling them down. After they had exhausted every possibility of suggestion and all had been reeeived favorably and without resistanee, they took their departure. 'Look here,' I said, as soon as they were out of hearing, 'you don't want to do all the fool things those fellows sugges'ed; it would make that gaff entirely unfit for the work.' 'Of course it would,' was his mild reply. 'I have no idea of doing what they said; in fact, paid so little attention that I really do not know what it was, but if I had said one word in protest those men would have argued with us until too late to do any fishing to-day, and probably eome back early to-morrow morning to resume the discussion. You take my advice and always say yes, and then do as you please.' And I do it."

"Well, sir, onee I saw one of those know-it-all fellows take the gaff, and from a little ninety-pound woman, at that," said the next man up.

"A lot of us were fishing every day off the doek, catching anything and everything, when they were biting. One queer specimen was an ugly, warty spotted fish, with wide mouth and jaws that would cut like steel wire cutters. Some of the boys ealled them dog—and some toad—fish. They were good for nothing, but great bait stealers, and we would throw them on the dock when eaught, and when through fishing kiek them overboard. We often amused ourselves by putting a stiek in their mouths to see them eut it in two with one snap of their jaws. A big man, wearing a broad white sombrero, and carrying a massive gold-headed cane, came on the dock one day. He swept everything before him; knew everybody on the dock when he had walked to the end and baek. Lived in a little Western town, forty miles from any water, and didn't know a tadpole from a turtle, but in a half hour was teliing everybody all about fish and fishing. He did not fish, but haunted the doek, exhibiting the fish caught and laid out by the fishermen. He would watch for strangers walking on the dock and call their attention to the fish, fairly deelaiming, as he named them, and told all he did and did not know about them.

"I had caught a partieularly vicious dog or toadfish one afternoon, and Buffalo Bill, as we had dubbed the big man, was inspeeting it from a safe distanee, when two women eame down the doek. They were passing by, with merely a careless glanee at the fish, when Bill halted them. Stepping out and taking off his big hat, with a low bow he erupted: 'Ladies, that is a great curiosity. One of the wonders of the deep. It is a dogfish, and has jaws of steel. With one snap of its jaws it can bite through a pieee of heavy wire. Some call it a toadfish on account of its ugly mottled skin, but dogfish is the correet name for it, as it is both formidable and vicious.'

"The women were slightly amused and mildly interested by the big fellow's harangue and approaehed nearer the fish. 'Don't eome too near, I beg of you, ladies. It is not very large, but if its eruel jaws closed on your foot it would eut through your shoe like a keen steel blade.' They smiled, and one of them put the toe of her dainty little patent leather against the big mouth of the now quiet fish. There was a sudden gape and snap, and the lady sprang baek with a seream, her shoe cut through to the sole. Fortunately her foot escaped, so the injury was to property and not person. We were all astonished and for the moment speechless. The big man was the first to recover. 'Why, my dear madam,' he began, but got no further.

"'You great big overgrown eowardly brute. You deliberately got me to stop here and put my foot in that thing's mouth just to see it bite my shoe. Talking your long-winded speeeh about its being dangerous, knowing that no one would believe what you said for a moment. You are a mean, sneaking coward, and if my husband was here he would throw you off the doek as you riehly deserve; swelling around here just to show off your big hat and long-tail eoat.'

"The little woman was fairly crying, and stamping her foot at eaeh word, and the wise thing would have been for the big fellow to get away, but he did not have the good sense to do this; instead he tried again to explain and apologize, whereupon the little woman slapped his face. He went then and we saw him no more."

It was my quitting time, and I had been winding in my line during the last story. As I gathered up my belongings and turned away I heard the next man say, "Well, sir, onee—"

LEWIS HOPKINS.

THE Marion County Fish and Game Protective Association held a meeting in the State House in Indianapolis on the night of Jan. 4, to eonfer with Fish and Game Commissioner Miles in reference to a proposed bill to license anglers and to urge the establishment of a State fish hatchery.

THE TOP RAIL.

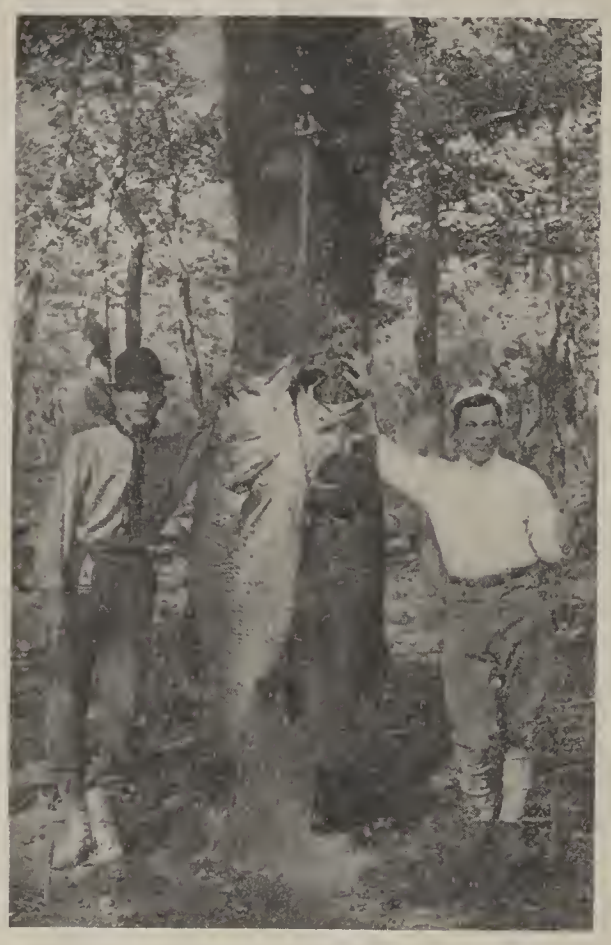
WHEN the late A. N. Cheney declared it was not all of fishing to catch fish, I doubt if he had in mind one form of amusement intimately associated with fishing which was not practiced to any extent during his span of life. Hunting with the camera came first, and here is a picture that belongs in the class of those which might well be called fishing with the camera, since in this pastime a rise is all important, and the bass shown have certainly risen until they appear to be in the record class for size.

Again, anglers who produce big fish generally explain the length of time their catches have been out of water and estimate the number of ounces of weight lost by shrinkage, but in the salubrious air of Arkansas, where J. M. Rose made this catch with his camera, it is plain that in this instance at least the very opposite of shrinkage took place, and once again the camera was initiated to full membership in the Ananias Club, thus lowering its traditional reputation for truthfulness still another notch.

Seriously, had I the choice, I would prefer to be photographed in this fashion than to be placed alongside of a rack of decaying big sea fish à la Catalina. For, in the former case, no one would be expected to ask the size of the bass, while in the latter one might be accused of keeping company with the same old stuffed fish that so many would-be anglers have claimed as their own.

* * *

A retail lumber business in the South was purchased by a very young but enthusiastic Kentuckian who had ideas of his own as to advertising. One of these was to cut up pine boards to proper size and have printed on them in big



CAUGHT WITH THE CAMERA.

type, "No shooting allowed." Underneath this legend appeared an invitation to "Buy your lumber from ———." In the local papers he advertised these boards as free to all who might apply for them, and some of the results were astonishing in a country where the only warning signs referred to dogs; one that I recall being worded as follows: "Fer a bad dog lok out." Some of the recipients of souvenirs placed them on the front gates of their yards, others on their houses, and a wag stuck one up on the local rifle range, whereupon it was employed as a target. Far out in the backwoods, three miles from a house, and on unfenced land owned by the State, I came upon several of these signs. Curious to learn who put them there, I followed the road, facing away from town on the theory that the man who obtained them had found satisfaction enough in getting something for nothing, and had tired of the things, but felt himself in duty bound to put them up somewhere. Sure enough, the last board was on State land near the boundary line of the first farm, and the farm itself had none. The owner was always glad to have shooters about, provided they would stop at his house, for he was a sportsman himself in a way, and often accompanied his guests.

* * *

I WONDER if this is the reason why some people shoot first and investigate afterward while in the woods? A Texas paper, in referring to greenhorns, says that they "shoot at anything they see promiscuously." It seems a good explanation: they "see promiscuously" and shoot in the same fashion—an unlucky combination for anyone within range.

* * *

A NEWARK paper which prints fishing and shooting news, replies in the following novel fashion to an inquirer:

"Deer do not shed their antlers every year. If they did the horns would never grow any longer than two inches."

Just why this near-naturalist fixed on two inches is no clearer than the reason for the first misstatement.

GRIZZLY KING.

Some News and a Little Gossip.

THE keel of the new Plant schooner has been cast, and has about 86 tons of lead. The material for the construction of the hull has been assembled at Bristol and the work of setting up the frames is proceeding very fast. This yacht is to be ready for racing next June and much is expected of her. The vessel will be of the centerboard type, a centerboard dropping through the lead keel as in the Queen. This will give the new yacht an advantage at windward work over the Westward, which, being built for European racing, had to be a keel craft. Centerboards are taxed on the other side of the Atlantic, and many think properly, too. If a centerboard is of any advantage to a yacht, and it apparently is or Herreshoff would not use it, then it should be paid for. In the races between Queen and Elmina the centerboard was certainly of advantage. This was noticeable in a run of the New York Y. C. some two or three years ago. The yachts were beating through the Vineyard Sound, and it was nip and tuck between Queen and Elmina with the latter in the weather position. They were short tacking into the beach, and Queen could not use her centerboard. Elmina held Queen under her lee until Cuttyhunk was reached, but as soon as the two got into deep water Queen dropped her centerboard and at once pulled out and won the race.

It has been announced that Morton F. Plant has engaged Capt. William S. Dennis to sail his new yacht. Capt. Dennis has for many years sailed the Elminas for Frederick F. Brewster and sailed them well, so that Mr. Brewster has a large collection of handsome trophies.

Some attribute Capt. Dennis's success to luck and say that he is nearly always favored by slants of wind that others do not find. If this happened only now and then it might be attributed to luck, but Capt. Dennis has a faculty of telling just how the wind will shift if it is going to change and how it will come in when it has died away, and this must be attributed more to experience than to luck, and it is this experience that has enabled him to win many prizes. At one time it was thought that Capt. Barr would have charge of this new yacht because he had sailed the Ingomar for Morton F. Plant in her campaign abroad, but Capt. Barr is still abroad looking after the Westward, and this is taken as an indication that he is to have charge of the Westward again for a second season. With Capt. Barr sailing the Westward and Capt. Dennis handling the new yacht the racing should be of the best, and with the other big craft, old and new, in the racing the interest will be much increased.

———

The Rochester Y. C. is to challenge for the Fisher cup now held by the Royal Canadian Y. C. This challenge was discussed at the last meeting of the Rochester yachtsmen and Eric Moore placed his yacht Seneca unconditionally

at the service of the club. The Canadians have expected that such a challenge would be sent, and at the annual meeting discussed the defense of the trophy. Next to the Canada Cup this is the most important prize held on the Lakes. Seneca caused the hitch over the Canada Cup. It was built before the present scantling restrictions were adopted and consequently has other yachts in her class at somewhat of a disadvantage. New yachts must be built more staunchly and consequently heavier. Seneca was sold to the Hanan Brothers, and after racing in salt water for a season, was re-sold to the Lakes and the Canadians argue that having been out of fresh water she was not eligible to compete for the cup.

The Detroit Y. C., at its annual meeting on Jan. 9, will elect officers. These nominations have been made: For Commodore, G. H. Bury; Vice-Commodore, H. C. Kendall; Rear-Commodore, W. W. Baird, John Gregson, H. B. Gunnison, Robert Kerr; Secretary, Louis W. Shimmel; Treasurer, A. C. Kramer, A. C. Pressland; Fleet Surgeon, Dr. O. E. Fisher; Fleet Measurer, Walter A. Oades; Directors—O. Barkenowitz, George Berriman, John Gregson, Robert Kerr, Dr. McClellan, M. Leonard, A. R. Smith, O. J. Volkman, L. H. Weitz, Charles Zink.

The South New Jersey Yacht Racing Association is working for uniform rules and other things for the betterment of the sport. Among other matters that of money prizes has been discussed and efforts are being made to do away with silver cups as trophies. One yachtsman voicing the sentiments of others has this to say about cash prizes:

"Silver cups valued at fancy prices are becoming less popular every year among yachtsmen. The cups make pretty ornaments, but they are not worth anywhere near their stated value. For instance, a cup valued at $1,000 contains no more than about $98 or $100 worth of silver, the remainder of the value of the cup is made up in the workmanship, in the designing and engraving. The Bermuda cup, one of the finest ever offered and probably the heaviest of any of the so-called $1,000 cups, contains only 102 ounces of silver. What most of the yachtsmen want nowadays is money prizes which will go toward defraying the expenses of racing.

"The best thing to boom yacht racing would be to adopt the system used in horse racing, charging an entrance fee for each boat with an additional starting fee. To this sweepstake the club could add the amount of money which is now donated toward the purchase of silver cups. This would allow three or four prizes of enough money value to make it an object for the yacht owner to start his boat.

"Under the present conditions the announcement is made that eight or ten yachts have entered for a certain race, but when it comes to the time for starting there are only as many boats in the race as there are prizes offered. With three or four good money prizes conditions would be entirely different. The eight or ten boat owners, who had paid an entrance fee of say $25 or $50 would surely start, figuring that they had a chance to win one of the prizes, which would at least pay for the expense of racing the boat. Instead of having two or three starters in a race, there would be a big field and better sport would be the result. Boat owners, no matter how wealthy, favor this scheme and believe that if it is put into effect will prove the greatest boom yachting has ever experienced."

Walter P. Bliss has purchased the steam yacht May, which for many years was used by Mr. and Mrs. Alexander S. Van Renssalaer, of Philadelphia. The May for some years was the flagship of the Corinthian Y. C., of Philadelphia, and before that was owned by E. D. Morgan and used by him when he was commodore of the New York Y. C.. Mr. Bliss is having some changes made on the yacht at Cramps, where it has been laid up. The May is a foreign built yacht, but her register was changed several years ago by an act of Congress and therefore escaped the penalty which is now being imposed on foreign pleasure craft under recent law. The May was built at Troon, Scotland in 1891. She is 207 feet long, 27½ feet beam and 17½ feet depth of hold. For the last two years the vessel has been laid up. Capt. Loveland has been in command ever since she was purchased by Mrs. Van Rensselaer, and before that was in charge of pleasure craft owned by the late John R. Fell.

Sea Isle Y. C. Affairs.

MEMBERS and officials of the Sea Isle City Y. C. are looking forward to a much busier and more enthusiastic summer among the owners of motor boats next season than ever before in the history of the organization. In addition to the regular racing and open dates there will be inaugurated on Aug. 12 a special challenge cup race for speed boats open to all clubs on the South Jersey coast between Atlantic City and Cape May. The race will be held each year.

The cup will be of silver, valued at $150, and presented by Sea Isle City. The race will be run under the American Power Boat Association rules. The only special stipulations are that the contest always be held over the Sea Isle City Y. C. course around Gull Island, until one club has succeeded in winning the trophy three times in succession. Then it will be run over the winning club's course each year until another club has performed the same feat. In the meantime whichever club wins the cup, that organization shall be its custodian until the next race is run.

Another new series of races which will be inaugurated at the Sea Isle City Y. C. Will be those run for a set of six cups. These races will be held each Saturday beginning June 10, and will be kept up until one boat has succeeded in winning all six cups. The contests will be governed by American Power Boat Association rules, and will be open only to open boats.

Among the many prominent boats along the South Jersey coast, and one which has been the subject of much favorable and envious comment is a large cutter belonging to several members of the Stone Harbor Y. C. The craft has quite a history. She was built at Cramps' shipyard for a South American warship, but being discarded because of the fact that she was too large to swing inboard on the davits, was sold to Commodore Henry H. Ottens, of the Wildwood Y. C., who, after running her in Ottens Canal and Grassy Sound, found that she drew too much water. The boat was then purchased by the Stone Harbor men.

Outside of the Government surf boats, there is probably not a better built boat on the South Jersey coast than this handsome cutter, which is rigged with a 15-horsepower engine, and is at present doing service between Stone Harbor yacht basin and Cape May Court House.

End of Famous Yachts.

IN these days, when yachts are built of steel or manganese bronze, says a London writer in the Sydney Mail, famous racing craft do not reach a quarter the age of their predecessors, which were built of wood and sheathed with copper. A few years ago all the big yachts were little better than racing machines, and were, therefore, fit for nothing else, although Sir Thomas Lipton's first Shamrock was sold to an American, who altered her rig, and used her for carrying scrap-iron.

But the rather clumsy old yachts of the past were stanch vessels which sailed the seas under mercantile flag long after their pleasure days were over. There was that famous yacht the Princess Mary, which brought William III. to England, for instance. After her royal master had no further use for her, she figured as a privateer, a West Indiaman, a transport, and a collier before being wrecked off the Tyne in 1827.

Few modern vessels could equal that record, although the yachts that figured in the original race for the America's Cup had a long and honorable life. Arrow, the British vessel, raced for many years afterward, and was latterly engaged in the coasting trade. She could still be seen in Southampton a year or two ago.

The American had a still more checkered career. Little sentiment was aroused by winners in those days, and her owner sold her to an Englishman for £1000. She passed to various owners, one of whom rebuilt her, while several entered her for races. During the American Civil War she was engaged in blockade running, and, in order to avoid capture, was scuttled and sunk.

Later on she was raised and used as a training ship for the American naval cadets. Once again she was raced after a refit, and later on her owners used her for cruising. Another cup racer, Livonia, was used in trade for many years until she was wrecked. An earlier defender, Columbia, of 1871, is now a fishing boat.

Some vessels are sold to forcign owners, like Thistle, which tried for the cup in 1887. She became the Meteor when bought by the German Emperor, and this act on his Majesty's part started the popularity of yachting in Germany. Giralda, the Spanish Royal yacht, originally belonged to the late Sir Henry M'Calmont, who sold her to Spain during the war with America. She was one of the finest steam yachts of her day, and, after being used as a transport and hospital ship, was fitted out for the use of the youthful King.

A yacht which served George IV., William IV., and Queen Victoria survived until some four years ago, when she was broken up. Launched in 1765, the late King Edward made a trip to the Channel Islands aboard her in 1846, so she was truly a link with the past.

Launch of Badger.

THE Sonder boat built by the Starling Burgess Company for C. H. W. Foster was launched last week at Marblehead and named Badger. This craft was designed by Starling Burgess, and as soon as it was put in the water it was towed to Mr. Foster's boat shop and hauled out for the winter. The new boat is very similar to the Beaver, which was built for Mr. Foster last year. Capt. Sam Doliber, who has charge of all of Mr. Foster's racing boats, in speaking of the new boat, said that she was the finest small racer that he had ever seen.

Built to the lines of the Beaver, which was considered last season by many to be the fastest Sonder boat of America, the Badger will be in the racing next summer from the very first and should make a fine showing. Her sister boat was the second member of the Spanish-American team and won for Mr. Foster the Gov. Draper cup. After the international series, Beaver was sold by Mr. Foster to George Dabney, who headed a syndicate of the Beverly Y. C.

Badger will not be the only new racer of the class next season, as there have been placed orders for four other boats. These are two Burgess-designed Sonder boats for A. P. Loring and a Mower boat ordered by Herbert M. Sears. Charles P. Curtis will have a new boat for the class to replace Ellen, and Fred M. Hoyt will replace his Skeezix.

Oregon Dinghy Club Meets.

AT the meeting of the Oregon Dinghy Club, at Portland, Ore., on Dec. 18, two interesting events were held. Four boats participated in each. The Butterfly, owned and sailed by Lew Woodward, won both by rather narrow margins. The race was over a one-mile course, which was covered by the Butterfly in 31m. and 10s., with the Bull Pup, sailed by Francis D'Arcy, second and the Celt and Kitten following in the order named. The second event over the same course was a little slower, the Butterfly winning in 32m. and 15s., with Celt, Bull Pup and Kitten following in the order given. The club will hold other events on Christmas Day and New Years Day.

Cost of Racing Yachts.

In British waters the popular class next season will be for yachts of 19 meters instead of 23 meters, and one reason for this is the cost of maintaining a first-class racing vessel.

"Are modern first class cutters too big to attract sufficient yachtsmen to keep the sport going? This is the question which has been agitating the yachting world of late," says the London Evening News, "but," it adds, "three cutters are being built for next season, but of 19 meters, roughly 100 tons, in place of the 23-meter boats as represented by the Shamrock. Two of these boats are being built by William Fife & Son, Fairlie, to the order of A. K. Stothert, who has already built Rosamond and Mariska, and Williams Yates, who built the 15-meter cutter Shimna in the first year of the rule, while the third is being built by McAlister to the order of W. P. Burton, who raced the Penitent and subsequently built Gauntless, Lucida, Brisomart and Ostara."

A. K. Stothert, explaining why 19-meter boats are being built, said: "The fact of the matter is that the new departure has been made owing to the 23-meter boats being too big. The building of a boat of this size entails an initial expenditure of about £11,000, while it would cost £4,000 a year to run her.

"In a 19-meter boat, however, the cost is much less, about half, roughly speaking, would be enough to run her, while you get practically the same accommodation as upon the 23-meter class. A 19-meter boat is really a Shamrock, but on a little smaller scale.

"Another advantage, too, is that owners with an income of from £4,000 to £6,000 a year can run a 19-meter boat, but a 23-meter would be out of their reach. This means that twenty men could support the smaller class, while there are only three or four who can run a boat the size of the Shamrock.

"On the smaller boats you get equally as much comfort as upon the larger and you can entertain quite as many friends. In the saloon of my boat, for instance, the floor is about 10 feet square. The bathroom, too, has a clear space of 6 feet square, and everything else is in proportion, while besides a roomy saloon the 19-meter boat has a roomy after cabin with two berths and three single berth cabins.

"It is also probable that the 19-meter boat will in the future be the largest of the international classes, for I hear that Germany, Spain and France will be building to this class, but none in the 23-meter.

"There is, I may add, some talk about the Americans sending a 19-meter cruiser to race in British waters, and if this should prove to be the case then races on both sides of the Atlantic in this class would be only the natural sequence of events."

Reverting again to the advantages possessed by the 19-meter boat over the 23-meter, Mr. Stothert pointed out that their lighter draft enabled hem to get in and out of harbor much more readily than their larger rivals.

"With a draft of 10 or 11 feet," he said, "a 19-meter boat can get in and out of the more difficult British harbors, such as Ramsgate, soon after or before half tide, but with the larger boat such a thing would be impossible.

"An expensive item in connection with the very large boats, too," continued Mr. Stothert, "is that of dock charges when the hull was to be scrubbed or examined. It costs from £20 to £30 to get into dock, but in the case of a 19-meter boat she can lie at the quay side and so be left dry as the tide runs out.

"As regards the question of the crew, a boat of the size of the Shamrock would need one of twenty-three and a pilot. In a 19-meter boat a crew of fourteen and a pilot is all that is necessary."

That Mr. Stothert is not alone in his opinion concerning the merits of the 19-meter class over the 23-meter is proved by Admiral Montagu's remarks in his Reminiscences.

"Every one who races," writes Admiral Montagu, "has his own opinion as to the size of yacht he prefers for the first-class racing. For my part, I think that of late years we have built too big craft. They are decidedly more expensive, and, to a certain extent, in heavy weather involve too great a risk to life and spars to be pleasant.

"All round the coast, with but few exceptions, tides have to be studied as of first importance, and these large vessels, drawing such an inordinate depth of water are in consequence severely handicapped. Then, again, they are quite unsalable when their racing days come to a close."

New York's Channels.

In his annual report to the Secretary of War, General Bixby, Chief of Engineers, U. S. A., says that nothing has been done to carry out the Jamaica Bay Improvement project, and that nothing will be done until the City of New York has taken definite action satisfactory to the Secretary of War. The appropriation of $250,500 which was to be expended in opening and maintaining an entrance channel 18 feet deep and 500 feet wide cannot be disbursed until the government has been assured of the co-operation of the city. The main waterway, as projected, is to have ultimately a depth of 30 feet, with a width of 1,500 feet in the entrance channel, and a width of 1,000 feet in the main channel. The channels are to be opened by dredging and maintained by dredging, and by the construction of jetties at the entrance to the bay, if necessary. The total ultimate cost to the United States for the improvement should not exceed $7,430,050, plus the cost of maintaining the entrance channel. The Bay Ridge and Red Hook Channels have both been widened to 1,200 feet, with depths of 35 feet. These channels are being improved under a project adopted in 1899, which provided for making Bay Ridge and Red Hook channels 40 feet deep at mean low water and 1,200 feet wide. The estimated cost was $2,500,000, of which $241,000 remains to be appropriated. The $5,000,000 Ambrose Channel is now seven-eighths completed. During the past year four U. S. dredgers were engaged upon this work nearly continuously, excavating 9,246,401 cubic yards of sand, mud and stones. Ambrose Channel has a depth of 40 feet at mean low water for 1,000 feet width over the inner half, and 1,750 to 1,900 feet width in the outer half. It is easily navigable at mean low tide for ships of 37 feet draft going at moderate speed and has a maximum high water capacity of 44 feet.

Horshoe Harbor Y. C. Officers.

The annual meeting of the Horseshoe Harbor Y. C. will be held next Wednesday. At this meeting it is proposed to raise the dues from $5 to $10.

The nominating commitee has posted the following ticket: George H. Sutton, for Commodore; Sidney T. Clulow for Vice-Commodore; Richard C. Heather for Secretary; C. C. Gould for Treasurer, and T. J. McCahill, Jr., for Trustee.

The nominating committee is William Page, Chairman; D. J. Levett, Frank E. Towle, R. C. Heather, G. H. Sutton.

Roxana to Cruise South.

The steam houseboat Roxana, owned by Larz Anderson, of this city, has sailed on a winter cruise in Southern waters. The vessel has been chartered to a wealthy Englishman, and she is on her way to Florida, where the lessee will take charge of her. She will be used on the shoal waterways of that State far a few weeks and later will go to Mexico, where she will make trips on rivers that the larger yacht belonging to the Englishman cannot go. The yacht will remain in Southern waters until late in the spring, when, it is said, she will return to this city to prepare for a summer cruise on the New England coast.

The Forest and Stream may be obtained from any newsdealer on order. Ask your dealer to supply you regularly.

Yachting and Rowing in San Francisco.

About one hundred members of the Corinthian Y. C. met in this city on Dec. 20 to consider ways and means of raising money for the rebuilding of the club house at Tiburon on the north side of San Francisco Bay. It is planned to spend about $20,000 on the building, which will give the Corinthians one of the finest club houses on the bay.

The Dolphin Rowing and Swimming Club, of San Francisco, opened the winter season on Dec. 11 with a rowing contest held off the club house at the foot of Van Ness avenue. The course was from the club house around Alcatraz Island in the Golden Gate and return. Two boats participated, the six-oared barge John Wieland and the four-oared barge Dolphin. The former won by one boat length. After the race some three hundred members of the club participated in the banquet which followed. On Dec. 18, the club held their annual club run from the club house to the ocean front near the Seal Rocks at which point they took a dip in the surf.

Winter Yachting at Puget Sound.

For the purpose of awakening an interest in winter yachting, and more particularly in the proposed New Years Day regatta, the Tacoma Y. C., of Tacoma; Wash., on Dec. 18, held a cruise in Puget Sound and followed this with a social evening at the club house. A determined effort is being made to awaken an interest in winter yachting at Tacoma and Seattle.

Motor Boating.

Bermuda Race Conditions.

The annual race for motor boats from this port to Bermuda will be started this year by the Motor Boat Club of America on Saturday, June 17, from some point in Gravesend Bay. The start is to be made at 2 o'clock in the afternoon, so that the racers can get clear of the harbor and well on their course long before sundown. The special committee of the Motor Boat Club, Vice-Commodore F. K. Burnham, Henry R. Sutphen, James Craig, Charles P. Tower and Thomas Fleming Day met last week and drafted the conditions to govern this contest. They also made plans to make the race more attractive than it has been in former years and will do everything possible to induce yachtsmen to enter their boats.

The prizes are the Challenge cup and $1,000 in cash to the winner, a second prize if three or more yachts start, and a third prize if five or more start. This year the race will be for yachts not over 100 fet in length and not under 40 feet, over all measurement. The rating is to be calculated according to the present rule of the Motor Boat Club of America, and the time allowance figured according to that club's scale. The distance taken for the computation of this allowance is 670 miles.

Any form of internal combustion engines may be employed for propulsion. The sail spread provided for may be carried at all times, if required without penalty. Stores and water for thirty days must be carried, and this provision will be strictly enforced. No boat will be allowed to start with less than six men on board, one of whom is to be a practical navigator, one a practical engineer and at least one-half of each crew must be amateurs. The definition of an amateur for this race is that used by the Yacht Racing Association of Long Island Sound.

The equipment called for is that a boat or life raft must be carried of sufficient buoyancy to salve the whole crew, or else two boats or a boat and a raft. There must also be a ring buoy or life jacket for each member of the crew. A full set of navigating instruments, a spare compass, sea anchor, oil bag and at least one gallon of crude oil, petroleum or other oil, and

fire extinguishers, must be on each yacht. Suitable arrangements must be made for fitting an emergency rudder. An assortment of spare parts and gear to the satisfaction of the committee must be carried. All boats must be equipped with the fittings and appliances prescribed by the government regulations.

Fuel must be carried in at least two distinct and fixed tanks permanently piped and connected. Fuel for lighting or cooking purposes may be carried in separate tanks. The carrying of fuel in tins or other temporary receptacles will not be allowed.

Entries for this race will be received up to one week before the start. There will be no entry fee, and there will be no fee for measurement.

Six Defenders for Motor Boat Cub.

COMMODORE H. H. MELVILLE, of the Motor Boat Club of America, speaking at the dinner of the Royal Motor Y. C. in London recently, announced that no less than six boats are now being specially built in this country to try to keep the British International trophy here this year. The races, he said, would be held in Huntington Harbor.

It is understood from reports from the other side that the changes in the deed of trust of this trophy have been agreed upon. Commodore Melville went abroad with power to act for the Motor Boat Club of America, the holders of the trophy, and now all remaining to be done is to get the sanction of Lord Northcliffe, the donor of the trophy, to the changes. The match in future will be not less than two out of three races. Some other slight changes have been made that more clearly define the requirements of the races. Challenges for this trophy must be received by the holding club by February, and after a challenge has been accepted, other countries can make entries. Efforts are being made to induce French, German and Italian motor boat enthusiasts to take part in the race.

It will be news to American yachtsmen that Huntington has been selected by the defending club as the scene of the contests. The Huntington course in 1908 gave entire satisfaction to all, and the change will be appreciated.

Fine Cruiser for E. H. Gold.

EGBERT H. GOLD, of Chicago, is to have a new yacht built which will be a fine addition to the rapidly growing fleet of the Lakes. Mr. Gold is an ardent yachtsman, and his new yacht will be thoroughly up-to-date and specially adapted for extensive cruising. The plans and specifications have been drawn by Gielow & Orr, and the yacht is being built at Manitowoc, Wis., at Burger's yard. The dimensions of this yacht are: Length over all, 69 feet 8 inches; length on load waterline, 67 feet 7 inches; extreme beam, 16 feet 10 inches; draft, 2 feet 8 inches. This light draft is necessary because Mr. Gold wishes to use his yacht where waters are shoal. She has, however, considerable beam, and her model is such that she should be good in any weather she is likely to meet. On account of the light draft, it has been necessary to have two tunnels in which the propellers work, and in case of the yacht touching ground, the propellers will not be injured.

The lines show an easy form with floor carried well forward and aft, indicating seaworthiness as well as liberal interior accommodations. Exceptional structural strength has been obtained by carrying up the sides of the hull for a distance of 50 feet fore and aft amidships, thus forming a flush deck vessel with nearly 7 feet clear head room. Instead of circular ports, rectangular windows are provided, which, together with skylights and ventilating cowls, will give excellent light and ventilation.

As the boat is intended for long cruises, the accommodations have been arranged with this feature especially in view, and liberal living quarters with ample closet and locker space have been provided. The main cabin or saloon is at the forward end, 13 feet long, and extending the full width of the yacht. It is fitted with divans, desk, piano, music cabinet, gun cases, etc. The space immediately aft of the saloon, 17 feet fore and aft, and the full width of the vessel, will be taken up by the owner's stateroom, bathroom and the guests' staterooms, fitted with berths, divans, wash basins with hot and cold water and open plumbing complete.

The next 19 feet of the boat will be used as the engine space, galley and quarters for the crew. The berths, bureaus and divans in the staterooms and saloon will be finished in polished mahogany and the balance of the interior will be finished in white enamel. The skylights and deck fixtures will all be of mahogany finished bright.

The yacht will be driven by a pair of Standard four-cylinder motors of 40 horsepower, with Tobin bronze shafts and manganese bronze propellers. The gasolene tanks will be forward on the main deck with gravity feed to the motors. The water tanks are cylindrical and fitted to receive air pressure, so as to supply running water throughout the yacht. The yacht will be steam heated and lighted by electricity. It is to be finished and ready for commission by May 20.

Yacht for Havana Race.

ENTHUSIASTIC yachtsmen all over the country are carefully laying their plans for the season of 1911. A host of new boats will be on the water during the coming summer, many of which are being built with a view to entering them in many of the famous events.

One of the principal boats now in course of construction is the handsome motor yacht which is being built in Camden, N. J., for J. F. Betz, 3d, of Philadelphia. Mr. Betz intends to use his new boat as a cruising yacht and has expressed his intention of entering her in the 1911 Philadelphia-Havana race.

The new yacht when completed will be 82 feet long, with a beam of 13½ feet. Her construction will be of the very best materials obtainable, having in view, at all times, strength as well as speed. She will be powered with a specially built 6-cylinder engine of 150 horsepower, and it is expected that this powerful piece of machinery will drive her through the water at a speed of at least 15 miles per hour.

The distance to Havana from Philadelphia is given officially as 1,300 miles, and in 1910, Berneyo, owned by S. W. Granbery, of Newark, N. J., negotiated these 1,300 miles in 6 days, 6 hours and 19 minutes. Berneyo's engine was one that is rated by the manufacturers at 25 horsepower, and as her average speed was a little less than 8 knots, it can readily be seen that should this new boat of Mr. Betz's come up to expectations, the best previous time record will be smashed. Mr. Betz has spared nothing in the way of expense in order to have this new boat the very best in all ways and confidently believes that, barring mishaps, he will equal the time by steamship from Philadelphia to Havana.

Much discomfort was experienced by the men who participated in last year's race by reason of the fact that most of the boats did not possess proper accommodations for the comfort of their crews in a race of that length and time. Mr. Betz intends that his new yacht shall provide every adequate convenience that may be the means of promoting the comfort of his crew. It is expected that the crew will consist of ten men, and since this necessarily means a considerable consumption of food during the trip, special attention has been paid to the galley, or boat's kitchen, which is designed to be extremely large and commodious.

One of the principal drawbacks which have militated against the success of ocean motor boat racing in the past has been the underpowering of the boats that have ventured on these long and hazardous journeys. Mr. Betz, however, has sought to prepare for this in the equipment of his new boat, and feels that he has successfully met the demand that conditions will exact, by the installation of this specially built engine of 150 horsepower.

The Hydroplane Boat.

ALTHOUGH this type of boat has, commercially speaking, little value, the high speeds obtained by quite moderate powers (compared with boats of ordinary shape) render it interesting to all naval architects, says E. C., in the International Marine Engineering.

The idea of eluding resistance by "skimming" the surface of the water is probably very old; the earliest authentic records however, show that the credit of first exploiting the idea belongs to an English clergyman, Rev. Ramus. Figs. 1 and 2 show his boats. These, for want of a light source of power (A. D. 1870) were propelled by rockets, and a speed of 63 knots was once obtained.

Generally speaking, a hydroplane consists of a hull carrying two or more surfaces; in some boats incorporated with the hull and in others attached below, the surfaces have a slight general inclination, and in a few cases slight curvature. The planes, when separate from the hull, are of small dimensions in the fore and aft direction and large in the transverse. Not less than two planes is the general rule—this to obtain longitudinal stability.

GENERAL THEORIES.

The reasons why a hydroplane boat has less resistance than an ordinary boat of the same weight may be understood from the following brief outline of the theory:

The waves thrown up by a boat of ordinary shape in its passage through the water are of two main types: (1) Transverse; (2) diverging. If the boat is short and the speed comparatively high, the waves set up are in case of (1) so far astern, or in case of (2) have receded so far from the boat that the energy spent in their creation is completely lost.

In the hydroplane boat, however, only the lower portions of planes are touching the water, the approximate relation between the weight of boat, speed and wetted area being

$$W = 3\,A\,V^2\,O.$$

O being angle of inclination of planes. When the boat is "skimming" the pressure is suddenly applied to the water, and is immediately released—the water tending at first to move outward from the bottom of the boat in all directions. That flowing forward reduces the relative velocity of the boat and water—that flowing aft quickly passes the step, while the water displaced in an athwartship direction tends to form waves parallel to the fore and aft line.

Immediately the plane has passed the pressure is relieved; the waves, therefore, have no time to grow to any size, and the energy spent in their creation is partially returned.

TYPES OF BOATS.

It will be quite impossible within the limits of one article to describe in detail all the types of hydroplane boats in existence to-day. These types lie in four main groups:

(*A*) Boat-shaped hulls carrying attached planes:
  (*i*) Flat planes.
  (*ii*) V planes.
  Santos-Dumont, Fig. 3. Italian boat, Fig. 5. W. B. Thompson, Fig. 4. Barrieau, Fig. 3A.

(*B*) Boat-shaped hulls with planes incorporated:
  (*i*) Fauber, Fig. 6.
  (*ii*) Thornycroft, Fig. 7.

(*C*) "Skimming-dish" hulls with planes incorporated:
  (*i*) Ramus, Fig. 1.
  (*ii*) Thornycroft (old type), Fig. 8.
  (*iii*) "Ricochet," Fig. 9. This is a popular type.
  (*iv*) Count Lambert, Fig. 10.

(*D*) Adjustable plane boats. There are several patents—no records of results.

(*E*) Freak boats. These are combinations of aeroplanes with hydroplanes—no practical success recorded.

There are numerous problems still unsolved in connection with hydroplanes. It will be seen at once that the ordinary stability calculations do not hold, and it is a fact that transverse stability is not easy to obtain. Fauber's boats are shaped to get more stability, and, of course, will do so if the vertical component of the dynamic pressure cuts the middle line plane above the center of gravity when the boat is inclined. Stability gained in this way must be at the expense of speed. Even in calm water "pounding" is a source of trouble, and in some boats the occupants sit on spring seats. This is obviated by giving a boat-shaped bow to several types. Other interesting problems are:

(*a*) What is the minimum critical speed for "skimming"?

(*b*) Inter-relation between weight, speed and power?

(*c*) Position of "step"?

(*d*) Type of propellers and best position for them.

Cruiser for C. M. Clark.

CHARLES M. CLARK, of New York, has ordered a 65-foot power cruiser from designs by Swazey, Raymond & Page, of this city. The yacht is expected to show a speed of eighteen miles an hour, power being furnished by a 100-horsepower motor. On a beam of 10.6 feet and draft of 4 feet the boat has generous acommodations. The arrangement plan shows a dining saloon on deck, the quarters of the crew being below. The galley is located abaft the dining saloon with motor compartment amidships. The after part of the boat is reserved for the owner. Mr. Clark was formerly commodore of the Moosehead Lake Y. C.

Gas Engines for Battleships.

A FEW months ago it was reported that the British Admiralty proposed to equip one of the battleships of the new program with motor engines. The current issue of the Motor Boat now publishes a statement to the effect that motor engines for a battleship are at present bein constructed in England.

"The design," it says, "consists of eight cylinder engines, practically two four-cylinder motors coupled in tandem, developing 12,000 horsepower, that is 1,500 horsepower a cylinder. Three of these 12,000-horsepower units are in process of construction, making an aggregate of 36,000 horsepower. The engines will be installed in a Dreadnought, we believe, of this year's or next year's program, and a speed of 21 knots is anticipated. The engines are of the two-stroke Diesel type, single acting, using crude oil as fuel."

Berneyo Not Damaged.

No recent achievement in the motor boating line has made such an impression as the trip of the Berneyo from Norfolk, Va., to Bermuda, last week. The passage consumed 5½ days, and the Gulf Stream, always dangerous, was crossed during one of the worst storms of the season. Captain S. W. Granbery, writing from St. Georges, Bermuda, states that the Berneyo made the trip in good shape, without any damage to the hull, and the engine responded whenever called upon, under all conditions of wind and sea. The motor, so Mr. Granbery asserts, is in as good shape to-day as the day it left the shop. No better argument than this could be offered, that the internal combustion marine engine of to-day has come into its own, occupying a position in the public's confidence that can only be attained through absolute reliable and faithful performance under adverse conditions.

BEFORE YOU BUY ANY FIREARM OR AMMUNITION, YOUR FUTURE SATISFACTION DEMANDS THAT YOU FIRST *SEE* THE INVALUABLE FEATURES OF

Remington — **UMC**

Trade Mark — Reg. U. S. Pat. Of.

Remington firearms lead in improvements.

Every Remington improvement fills a long felt want in the shooter's heart.

They mean maximum pleasure and satisfaction through greater efficiency and dependability—and absolute safety whatever the conditions.

You know that all REMINGTONS are built solid breech, hammerless:

—that the REMINGTON **Autoloading Rifle** is the only recoil operated rifle that locks the cartridge in the chamber until after the shot is fired.

—that the REMINGTON **.22 Repeater** has fewer, simpler, bigger and stronger parts to its action than any other repeater.

—that every U M C cartridge in every box is absolutely perfect because individually inspected at every stage of construction.

—that the steel lining in U M C shot shells saves the load from weakening in rainy weather by excluding all moisture.

But—have you actually seen and examined these features as yet for yourself? You'll fully appreciate the big meaning of the name REMINGTON-UMC when you do. Any dealer will gladly demonstrate.

Remington and U M C—the perfect shooting combination.

DRIVERS AND TWISTERS.

The match for the E. C. cup, arranged to take place between Lester S. German and W. R. Crosby, at Chicago on Saturday of this week, has been postponed to Jan. 14.

At Raven Run, a suburb of Shenandoah, Pa., Dec. 31, Thomas Williams, of Connerton, and Alfred Woods, of Raven Run, shot a match at 9 birds, 21yds., for a purse of $250. The scores were: Williams 5 out of 6, Woods 1.

At Tumbling Run, near Pottsville, Pa., a tie contest took place on Dec. 31, between John Rehman, of Pottsville and Charles Zerbe, of Mount Pleasant. The match was at 21 birds for a purse of 150. Each scored 19.

The next shoot of the Hudson Gun Club, of Jersey City, is fixed to be held on Jan. 15.

We are informed that "at a meeting of the Riverside Gun Club, held Dec. 28, the club voted to build a new club house. The club will be ready to hold the first shoot from it on Washington's Birthday. A notice of the registered tournament will be published later. The members of the committee are Harry Harrison, Wm. Peeters, H. Peeters, Less Trott, R. Patterson, Dr. J. L. Weller."

The tenth annual Sunny South Handicap, to be held at Houston, Tex., Jan. 23-28, will be managed by Alf. Gardiner. On the first and second days there will be ten 20-target events, $2.00 entrance, $10.00 added. On the third day, there will be five 20-target events, and one at 100 targets, $10 entrance, for the Chronicle trophy, emblematic of the Southern amateur championship. On the fourth day, eight 20 target events, $2.50 entrance, $25.00 added, and No. 9, the Post trophy, emblematic of the team championship. Five 20-target events on the fifth day precede the Sunny South Handicap, 100 targets, $10 entrance, $100 added, handicaps, 16 to 22yds. Ten 20-target events are provided on the sixth day. Ship guns, etc., prepaid to Houston Sporting Goods Store.

BERNARD WATERS.

Highland Gun Club.

EDGE HILL, Pa., Dec. 31.—There was a skillful gathering, several of the best shots of the club being present. The weather was severely cold. In the totals, C. H. Newcomb was high with 82 out of 90, while J. Griffith and Dr. Wentz were next with 80. In the club shoot, T. Tansey was high with 48. Frank S. Cantrell, Jr., and Charles H. Newcomb each had 46, Griffith and Boyer 44, and Wentz 43. In the shoot at 5 doubles for the George S. McCarty trophy, the honors were shared by Tansey, Cantrell and Herman, who each made 9.

Club shoot 50 targets:

Events:	1	2	3	Events:	1	2	3

New York Athletic Club.

TRAVERS ISLAND, N. Y., Dec. 31.—The attendance was light, there being only nine shooters present. A strong wind and a low temperature made unfavorable conditions for good scoring. The December cup was an object of keen interest, it being the last contest for that desirable prize. A. E. Ranney scored the leg, but as it was the only one he had scored, the cup went to G. J. Corbett, who had two legs scored on it. G. Lembeck scored a leg on the tournament cup, and in shooting off with the previous holder of the cup, G. J. Corbett, he won 22 to 21. Corbett was first with 23 in the scrtach shoot. In the event at doubles, Lembeck was high with 11 out of 20. Scores:

Haslin cup, 25 targets, handicap:

O C Grinnell, Jr...	1	20	E M Huggins.....	5	19
G Lembeck	1	20	Dr De Wolfe.....	3	19

Dr De Wolfe.....	10	Dr Culver	7

Crescent Athletic Club.

BAY RIDGE, L. I., Dec. 31.—The weather was cold and clear. Fifteen contestants took part in the shooting. Full scores were scarce. The leg for the December cup was closely contested, this being the final shoot for it. George Felix was high with 23, and was the permanent winner with a total of 71, R. B. Fox, Jr., and C. R. James being the runners up with 68. In the contest for the J. F. James trophy, Frank B. Stephenson scored 24 from scratch and was tied by J. H. Vanderveer, with one allowance, they taking first and second in the order named. The latter was first in the sweepstakes shoot, 25 targets.

Three teams contested for the team prize, Stephenson and J. F. James tying Stiner and C. R. James with 43. In the shoot-off Stephenson and James won with a total of 46. R. E. Fox and H. W. Woodcock were high with full scores in the team and trophy shoot. Stephenson and Stiner tied on 23 for the Stake trophy. In the shoot-off they again tied on 23. In the second shoot-off Stephenson won, 20 to 19, Woodcock won the leg on the Lockwood trophy after a shoot-off with Stephenson. Scores:

December cup, 25 targets, handicap:

Hart trophy, 10 pairs doubles, scratch:

E W Heller.....	12	W E Stewart	7
A Colgate	10	L H Ross	6
C H Daly.....	9	A O Headley	5
B S Ross, Jr.....	9	A Colgate	5
D W Granberry.....	9	J A Hart	5
H T Schriver	8	T Hawk, Jr.	3

Challenge cup match, Austin Colgate, holder, vs. J. A. Hart, challenger: Won by Hart with 22 targets from scratch.

Ossining Gun Club.

OSSINING, N. Y., Dec. 29.—The following scores were made at the grounds of the Ossining Gun Club, Monday, Dec. 26. A snowstorm set in, which made the light bad, so high scores were impossible.

Event No. 1, 10 targets:

N Hubbell	2	Col F Brandreth.....	7
Brewerton	8	D Brandreth	7
Hyland	5	Blandford	9
Burns	4	Tuttle	8
Lyons	6	Kirby	2
Barlow	6		

Event No. 2, 50 targets, handicap, for six prizes:

Brewerton.	6	48	J Jenkins	20	39
G Hubbell	6	47	Willi	6	37
Tuttle	9	45	Kirby	20	34
D Brandreth	4	43	N Hubbell	20	34
Dietrich	9	43	Lyons	8	34
Hyland	7	42	Hahn	12	33
Blandford	4	41	Barlow.	10	32
Col F Brandreth...	5	40			

Event No. 3, 15 targets, scratch:

D Brandreth	14	Lyons	10
Hyland	13	G Hubbell	9
Blandford	13	Tuttle	9
Col F Brandreth.....	10	Kirby	1

Event No. 4, 25 targets, scratch:

Col F Brandreth.....	15	Lyons	18
D Brandreth	18	G Hubbell	23
Hyland	15		

J. T. HYLANN, Sec'y.

Indianapolis Gun Club.

INDIANAPOLIS, Ind., Dec. 24.—Lewis, at the 16yd. mark, scored his fourth win in the contest for the Comstock trophy, and carried the handsome cup home with him, being the first contestant to meet the conditions of the handicap. Attendance small because of the weather and the attractions of the Christmas season.

Practice scores, each man shooting at 60 targets:

Dixon	51	Neighbors.	49
Britton	41	Lewis	48

Comstock trophy No. 2, 50 targets, distance handicap:

Dixon, 18	42	Neighbors, 16	39
Britton, 18	37	Lewis, 16	46

Fred Macaulay Gun Club.

NEWARK, N. J., Dec. 27.—Fifteen marksmen took part yesterday in the events arranged at the Speedway traps for the members of the Fred Macaulay Business Men's Club. There was also a goodly turnout of spectators. Merchandise prizes were shot for; 2,125 targets were thrown. Accurate shooting was difficult, owing to the fact that the snow and wind interfered with the sportsmen.

Chris Feigenspan was high average gunner of the day with 207 out of 275. James J. Wheaton was a close second with 148 out of 200. Frank Mihlon, captain of the club, was third, with 177 out of 250 birds.

In the merchandise prize event, James J. Wheaton took first with 66 out of 75. B. M. Shanley, Jr., was second with 65 out of 75. Frank Mihlon was third with 63 out of 75. George A. Ohl, Jr., was fourth, with 59 out of 75. Fred Macaulay and Chris. Feigenspan tied for fifth prize with 51 each out of 75. Each member was handicapped according to the scores he made on the last three weekly shoots of the club. The scores:

N J Matthews	12	14	13	13	10	17	9	..	..	..
Fred Macaulay	16	11	13	16	..	..	..	..	..	..
Tom Cook	13	12	15	14	..	..	..	..	..	..
E Caruso	16	17	14	19	15	..	..	..	..	..
A D Tunis.....	14	18	16	21	18	19	..	..	..	..
Frank Mihlon	20	15	17	17	17	19	19	19	17	17
Geore H Ohl, Jr.....	15	15	11	15	20	12	12	11	..	..
James J Wheaton	20	21	18	18	18	23	16	14	..	..
James Quinn	15	11	..	..	..	..	..	..	..	..
Willard McKee	8	8	..	..	..	..	..	..	..	..
John Engelhorn	7	..	..	..	..	..	..	..	..	..
Joseph Burns	9	10	10	10	13	11	9	..	..	..
B M Shanley, Jr.....	13	11	10	13	14	18	16	16	10	..
Jack Fanning	19	..	..	..	..	..	..	..	..	..
Chris Feigenspan	18	19	21	16	23	17	19	15	17	24

Dec. 28.—The members had a lively time at the Speedway traps to-day. Frank Mihlon, the captain of the organization, was high gun with an average of 20 out of each 25 shot at, or 160 out of 200 shot at. He was also the only gunner to break 24 bluerocks out of a possible 25. It looked bad for Koegel in the $100 100-target match. J. J. Wheaton, of the Macaulay gunners, was second, with an average of 74 out of 100. There were ten squads in all, and 1,100 targets were shot at. Scores:

B M Shanley, Jr.....	19	13	17	16	17	18	12	19	14	21
F Lawrence	20	20	19	24	..	..	..	..	..	..

William Stengel	19	13	12	..	..	..	..	..	..	..
John Geiger	18	20	21	..	..	..	..	..	..	..

SMOKELESS.

Siwanoy Country Club.

MT. VERNON, N. Y., Dec. 26.—The Siwanoy Country Club held a shoot this morning for special prizes, as well as a continuation of the competitions for the president's trophy and the police commissioner's trophy. Fourteen members attended the shoot, and some good scores were made, as will be seen from the records given below:

Special prizes:

W Thorpe	10	23	C W Schedler.....	10	22
W Thorpe, Jr.....	6	20	G A Wylie.....	0	22
C G Stone.....	4	16	H D Lent, Jr.....	0	12
W M Wylie.....	10	20	J G Wintjen.....	0	20
H J Smith.....	6	23	Andruss.	0	7
L G Ranch.....	2	21	H V Morgan.....	2	18
J D Connor.....	10	15	H D Lent	8	21

There were four prizes offered. Messrs. W. Thorpe and H. J. Smith tied for first and second, and Messrs. C. W. Schedler and G. A. Wylie for third and fourth. In the shoot-off W. Thorpe won first prize, H. J. Smith second, G. A. Wylie third, and C. W. Schedler fourth.

President's trophy:

W Thorpe	10	23	C W Schedler.....	10	22
W Thorpe, Jr.	6	20	G A Wylie	0	22
C G Stone.....	4	16	H D Lent, Jr.....	0	12
W M Wylie.....	10	20	J G Wintjen	0	20
H J Smith.....	6	23	Andruss	0	7
L G Rauch.....	2	21	H V Morgan.....	2	18
J D Connor.....	10	15	H D Lent	8	21

Police commissioner's trophy:

W Thorpe	10	20	C W Schedler.....	9	23
W Thorpe, Jr.....	10	24	G A Wylie.....	8	25
C G Stone	8	20	H D Lent, Jr.....	0	16
W M Wylie.....	10	23	J G Wintjen.....	2	20
H J Smith.....	9	25	H V Morgan.....	10	25
L G Rauch.....	9	23	H D Lent.....	0	18
J D Connor.....	4	9			

The next shoot will be held on Monday, Jan. 2, 1911, at 9:30 A. M., at which time special prizes will be offered, as well as the final leg on the police commissioner's trophy, and next to the last leg on the president's trophy. It is hoped that there will be a good attendance on this occasion.

H. J. SMITH.

Eagle Gun Club.

MANOA, Pa., Dec. 31.—Ungerer scored 10 straight, defeating fifteen contestants for first money in the club shoot to-day. Six tied on 9.

Ten-bird event, handicap:

Ungerer, 29 ..2112222122—10	Knowles, 28..0222012212— 8

Bergen Beach Gun Club.

BROOKLYN, L. I.—The annual New Year's Day merchandise shoot of the Bergen Beach Gun Club, Jan. 2, attracted a surprisingly large entry list, considering the weather that was served up, there being a mixture of rain, mist and fog, so that at times the targets would be lost in the gloom almost immediately after they were ejected from the trap, and even the trap house was hardly visible at intervals.

The officers of the club were on hand early to look after their guests, and in pairs and in bunches the shooters arrived, in spite of the rain and gloomy weather, until at the end there were forty-four amateurs who took part in the merchandise distance handicap at 50 targets, the shooters being arranged in Classes A, B and C, according to past achievements at the club's traps.

Of course, Class C, which is the kindergarten class, had the greatest entry list, but not the worst performers, as two men, T. H. Foster, a comparative beginner at the game, who borrowed Capt. Dreyer's gun, which he had never shot before, broke 45 out of his quota of 50, and W. L. Silkworth, who a very few years ago, could not break more than 50 per cent. of his targets, tripped in with the same number. Charley Schreyvogel, as enthusiastic as ever, smote 44 of them and was second high in his class, and his finish with a 24 was very classy after a mediocre start; 24s were very scarce, Deacon Moeller and John Gaughen, the latter in a postscript, being the only ones to corral that number in any round. Of course, these were from 16yds.

Gaughen topped the Class B delegation with his 45, which he made on a re-entry and thus supplanted Ad. Suydam, who looked good with a 43 in that list.

Louis Schortemeier, from 19yds., headed the Class A bunch, small and select as it was, with a 45, while J. F. Simonson was just one notch away and F. R. Long third with 41.

Capt. Dreyer and Charley Blake, side by side, had the same scores in reverse order, with totals of 42.

There were a lot of nice prizes, twenty-six in number, and the boys went away well pleased, especially John Vanderveer, who selected an umbrella for his prize on such a wet day, as he was just about to buy an umbrella, and Von Beckman did likewise.

As it was getting quite dark when the event was concluded, numbers were put in a hat and the men having scores at the top and then on down the list drew for choice, and Schorty got first choice and took a cut-glass pitcher; Gaughen an oval fruit bowl; Silkworth a silver nut dish, and Foster, who wears a beard, had a shaving set selected for him by his friend Long. The reader is left to conjecture what Long must think of Foster's whiskers. There were cut-glass pieces, carving sets, and silver pieces that would be useful and ornamental, but Billy O'Brien got a package of stogies that appealed to him.

The boys certainly kept the No. 2 set of traps busy from early in the day until it was too dark to see any more. Dalton, Strader, Blake and Gaughen, seconded by Dr. Groll, led the onslaught against the clay saucers. There were just three straights made in the 15-target events, Schorty getting two in a row and Dr. Medler getting the other.

Taking it all in all, the boys went away pretty well satisfied, with the exception of the kind of weather that was served up during the day.

The following are the scores:

Class C.				
I McKane, 16	18	19—37	..	..
J A Howard, 16	17	16—33	17	14—31
P Von Beckman, 16	20	20—40	19	23—42
*J W Hessian, 16	15	17—32	..	..

WINCHESTER

Rifles, Shotguns and Ammunition

THE W BRAND

TRADE MARK
REG IN U S. PAT. OFF.

NO matter what you hunt or where you hunt, the answer to the question "What rifle shall I take?" is—a Winchester. Winchester Repeating Rifles are made in ten different models for all styles of cartridges, from .22 to .50 caliber. Whichever model you select, you will find it a hard, accurate and reliable shooter. Winchester Repeating Shotguns have stood the trying practical tests of sportsmen and the rigid technical trials of the U. S. Ordnance Board. Their popularity with the former, and the official endorsement by the latter, are convincing proof of their reliability, wearing and shooting qualities. If you want your equipment as perfect as possible, use Winchester guns for all your shooting and Winchester ammunition for all your guns. They are made for each other.

FREE—Send address for Catalogue of Winchester—the Red W Brand—Guns and Ammunition.

Hudson Gun Club.

JERSEY CITY, N. J., Jan. 1.—With a straight score, Mr. D. D. Engle, started the ball rolling for 1911, at the Hudson Gun Club grounds this morning, and finished high gun with an average of 92 per cent. Billy O'Brien was the runner-up and finished with 87 per cent.

There was quite a gathering of trapshooters from the Clarendon Gun Club, who journeyed to our grounds to witness a team match between three shooters from each club for a suitable purse and dinners for ten friends of the winning team. The Hudson boys were victorious, winning by 34 targets. There was also a number of individual matches shot between several of our members to-day. It seemed as though every shooter at the grounds this morning had a chip on his shoulder waiting for it to be knocked off. First it was Burlington and Leary, who had to call it a draw after each shooter broke 42 out of 50.

Next to face the firing line were the Cherry brothers. There was nothing to it after the first 50 targets shot, and Lou was returned a winner by 15 birds. Burlington and Kelley were the next two that tried for fame. Two 25-target events were enough for them, so they adjourned to the club house to talk it over, and make way for Doc Groll and Joe Whitley, who each shot at 25 targets, Whitley winning by the narrowest of margins, one bird. The Doctor is willing to bet that he can clean Whitley up the next time they come together.

The morning was dark and cloudy, with very little wind blowing, but the rain that started about 11 A. M. made things very disagreeable for the boys to stand outside and shoot in it.

Jan. 15 is our next club shoot date. We start to shoot our club prizes on that date, and request the attendance of every member that can possibly attend.

M. W. CONOVER, Sec'y.

Hyde Park Gun Club.

CINCINNATI, O.—With the coming of a New Year interest in trapshooting seems to be reviving a little. Nothing very startling, but just an indication that the old hustlers are still in the game, and propose to do business once more. On Dec. 31, there were five members at the grounds, not a big crowd, but very promising after a lapse of two or three weeks, with not a single shooter showing up on club day. The day was chilly, and the light poor, so that it was difficult to see the targets at times. S. Leever, well-known to the baseball fans, and not unknown to trapshooters in this section, was high with 45. This is his first shoot since last spring, and he will be practising until the ball season opens again. Malloy gets here once in a while, and generally makes good. The trap boys failed to put in an appearance, and Dr. Phillip tended trap, while E. W. Rugg pulled the lever. The latter was badly shaken up in a recent street car collision, and was not in trim to shoot. Scott is a new one, or nearly so, but he only needs a little practice to enable him to locate the clays without trouble. Eustis and Rhodes have not been out for a long time, as their scores would indicate. The club will start its series of monthly prize shoots about the middle of January. These have proved popular in the past and will be drawing cards in the future.

S Leever	22 23—45	Malloy	20 ..—20
Eustis	20 14—34	Scott	4 ..— 4
Rhodes	12 14—26		

Internal Ballistics.

DEFINITIONS.

A *gun* is a thermo-dynamic machine by which the potential energy of the explosive is converted into the kinetic energy of the projectile.

The *potential* of an explosive is the mechanical *equivalent* of the heat produced, acting on the increased volume of the converted charge, by the combustion of the explosive; the mechanical *effect* which may be obtained is but a part of the potential; the pressure derived is also a part only.

Internal ballistics is a term signifying the effects of the combustion of the explosive so far as they relate to the gun and to the projectile as long as it is within the gun. Therefore internal ballistics comprise—the nature and value of the stresses upon the gun barrel and breech; friction upon the gun; the pressure upon the base of the projectile; the muzzle velocity of the projectile; erosion; fouling; recoil; jump and flip.

The *combustion* of an explosive is a gradual process, and the rise of pressure is gradual, the time varying according to the nature of the explosive and in the manner of combustion; but the explosion may be detonation, in which case ignition of individual grains is quicker than the travel of the flame, and therefore they are not ignited by flame, but are ignited by vibration.

Detonation of an explosive is a term used by Berthelot and others to signify more than ordinarily rapid explosion; the result of particular conditions, some of which will be specified later.

Wave-pressure is a term applied to the abnormally high pressures which occasionally occur; they are the result of an unequal confinement of evolved gases.

Stresses.—The stresses upon a gun are a radial stress or "pressure"; a tangential stress, or hoop tension, which tends to split the barrel open longitudinally, being similar in its action to the force which bursts the hoops of a barrel; a longitudinal stress.

Recoil is the movement of the gun longitudinally in the reverse direction to that taken by the projectile. "Jump" and "flip" are secondary movements—vertical and lateral respectively—and are dependent both upon the charge used and the position of the shooter in firing.

THE BALLISTIC ACTION OF AN EXPLOSION.

The object of exploding a charge of gunpowder within a gun barrel is to move a load from a condition of rest and impart to it a certain velocity; it is obtained by the gradual expansion of the explosive as it decomposes by burning. This gradual expansion, by moving the bullet and so enlarging the chamber in which the powder is exploding, reduces the mechanical effect of the combustion. Instead of the 43 tons pressure to the square inch obtained by exploding black gunpowder in a confined vessel, but a fraction results when the same powder is fired in a small arm under ordinary conditions; much of the energy is used up in producing heat which is absorbed.

There are other causes, in addition, so that comparatively little of the total latent energy—or potential—of the explosive is converted by burning into kinetic energy in the projectile; with the most favorable conditions this energy is conveyed in a manner which may be likened to a vigorous push against the base of a yielding bullet; with unfavorable conditions, is of the nature of a crushing blow.

Time for the translation of the energy is all-important; a greater percentage of kinetic energy is derived from slow-burning powders, greater local pressure from those whose decomposition is most rapid. The nature of the work required of a gun, therefore, necessitates the use of comparatively slow burning powders.

"Work" is the result of a force acting upon a body through a distance; the product is termed "foot-pounds."

"The unit of work called the foot-pound is that amount which is performed in raising a weight of 1lb. through a distance of 1ft. against gravity. If 1lb. be raised 2ft., 2 units of work are done; if 4lbs. be raised through 5ft., then 20 units of work, expressed as 20 ft.-lbs. *Energy* is the expression used to define the work contained in a moving body, such as produced by falling from a certain height, and signifies its weight and velocity. Eliminating the loss of energy in overcoming frictional and other resistances, the work done by the pressure of the explosive on the bore of a gun must equal the energy contained in the projectile. The formula for ascertaining the energy is $Ps = \frac{wv^2}{2g}$, where P is the mean thrust in pounds exerted over a length of the barrel; s feet, on the base of the projectile; v the muzzle velocity of the projectile in feet per second; and w its weight in pounds, and g gravitation units. Example: What is the average thrust or pressure on the base of a Martini-Henry bullet? Length of bore = 33in.; of powder charge, 2in.; the difference, 31in., will be the distance through which the pressure of the explosive acts on the base of the bullet. The bullet weighs 480grs., or $\frac{480}{7000}$ lb., and its muzzle velocity is 1,315 foot-seconds; therefore

$$P \times \frac{31}{12} = \frac{\frac{480}{7000} \times (1315)^2}{2 \times 32.2} = 712.64 \text{ lbs.}$$

Example: What is the muzzle energy of the Lee-Metford bullet? Weight of bullet = 215grs. = $\frac{215}{7000}$ lbs., muzzle velocity, 2,000 f.s.:

$$\text{Energy} = \frac{wv^2}{2g} = \frac{\frac{215}{7000} \times (2000)^2}{64.4} = 1{,}907 \text{ ft.-lbs.}$$

Energy increases as the square of the velocity; thus, if the weight of the bullet is constant, and its velocity doubled, the energy is four times as great. The momentum of a body, whose weight is w lbs., moving with a velocity v foot-seconds is $\frac{wv}{g}$ (seconds-pounds), and may be defined as the quantity of motion in a moving body. Supposing a projectile to be traveling at the rate of 1,000 ft. per second, and its weight to be 1 lb., it would have the same momentum as a ½-lb. shot traveling at the rate of 2,000 ft. per second, but the energy of the ½-lb. shot would be double that of the 1-lb. shot."

From the formula it might be assumed that the energy is derived from constant thrust or push on the base of the bullet. Of course the action is quite different; there is increasing pressure upon the bullet until its inertia is overcome, but as it nears the muzzle, and its velocity increases, the pressure diminishes. As it is impossible to overcome the inertia of a mass save by the application of a force for a period of time proportionate to the weight, the ballistic value of an explosive depends upon the time required for the combustion, which, with black gunpowder, may be to some extent regulated by the shape, size and density of the grains. By a proper adjustment of the powder charge to the weight of the bullet and capacity of the barrel, such a pressure is maintained upon the base of the projectile as to increase its velocity as long as it remains within the barrel. Simple as this may seem, it constitutes a large portion of the science of gunnery; a theoretically perfect result would be obtained if the last atom of powder were converted into gas at the moment the bullet leaves the muzzle.

M. Berthelot distinguishes the variation in the rate of combustion of each kind of explosive by two classes—one, the normal explosion, as combustion; the quicker as "detonation"—but adds that "between the two there may exist a series of intermediate modes of explosion. In fact, the passage from one class to another is accompanied by violent and irregular movements of the material, during which the propagation of the combustion acts by a vibratory movement of increasing amplitude, and with more or less velocity." Black powder is computed to generate thrice the amount of radial pressure when the quicker class of combustion occurs.

Too rapid combustion produces an increase of heat and pressure, but the pressure being local—that is, confined to the cartridge chamber—it does not act upon the base of the projectile for the same distance; consequently the ballistic value is less, while the excess of pressure may prove dangerous, and is always detrimental. Means are taken to avoid a "detonation" or abnormally quick combustion of explosives when used in guns.

There are various methods by which the explosion of the charge, or a part of it, may be retarded after ignition. For instance, simply by granulating the powder, and proportioning the size of grain to the bore; for, supposing powder similar in all other respects, its conversion into gas depends on the rate of ignition of the grains and the time of combustion of each grain. The rate of ignition depends upon the facility with which the flame can penetrate the charge and its heat—that is, on the form of the grains composing it—and, further, upon the hardness of the grains, and the amount of glaze upon them; the rate of combustion, on the bulk or size of the grains themselves, and their specific gravity. The larger and denser the grains, the slower they burn.

It has been found by experience that greater uniformity of action is secured by having all the grains of the same size. The burning of the grains first ignited produces gas, and the pressure starts the bullet; then the heat generated causes the remainder of the charge to burn under conditions more favorable to rapid combustion, the gases are liberated more quickly, and a greater percentage of the explosive is converted into gas; so that there is an increasing pressure upon the base of the bullet until it shall have attained a proportionate velocity.

THE CLASS OF EXPLOSION.

Ordinary nitro powders are not readily ignited by a flame at a low temperature; a large flame or a hot flame, as from a blow-pipe, will ignite any powder, but especially nitro powders, more quickly. Once ignited, the combustion of a few grains produces such heat and pressure as to cause a far more rapid explosion of the grains contiguous to them, and if the heat increases with the combustion, as with some conditions it must, then eventually a point is reached when the grains do not burn, but detonate. Some years ago some experiments were carried out by Mr. Teasdale Buckell, who has long been editor of Land and Water; by these he ascertained that, whereas the flash of an ordinary cap would ignite the whole of the grains of black powder furthest removed from its base in a 12-bore cartridge case, the same flash would not ignite the furthest removed grains of nitro powder.

"When a shock sufficiently violent is produced in one part of an explosive substance, and if the pressures which result from this shock are too sudden to be propagated to the whole mass, the transformation of the vis viva into heat will take place chiefly in the first portion of the mass. This may thus be raised to a suffi-

cient temperature to detonate. If the first production of gas is so rapid that the mass of material has not time to be displaced, and if the expansion of gas produces a more violent shock on the adjoining portion of the material, the vis viva of the new shock will be transformed to heat, and thus give rise to the detonation of a new portion of the material. This alternate action of a shock, the vis viva of which is transformed into heat, and a production of heat which raises the temperature of the next portion so as to produce a new detonation, transmits the reaction from portion to portion throughout the entire mass.

"The propagation of the inflammation, then, in this class of detonation may be compared to that of a wave sound, i. e., it is a true wave of explosion traveling with a velocity incomparably greater than that of a simple ignition transmitted by contact from particle to particle, and when the gases freely expand as they are produced. It must also be remarked that while the wave of sound is generated by a periodic succession of similar waves, that of explosion is not periodic, but takes place once for all."—Longridge.

WAVE PRESSURE.

The maximum pressures are due to the wave action set up by the explosion. Capt. Noble has determined that the average pressure is much less. Using pistons shielded from the effect of wave action and unprotected pistons in the same gun at the same time, the shielded crusher pistons gave pressures of 32.4, 32.0, and 33.6 tons, but the unshielded piston gave 47 tons pressure to the square inch.

Further, wave action set up in a 10in. gun gave the same velocity as when no wave action was set up, so that the mean pressure must have been practically the same. The five crusher gauges were placed, three in the powder chamber, one in the shot chamber, and one a few inches in front; they gave:

With wave action, 63.4, 41.6, 37.0, 41.9, 25.8 tons to sq. in.
With no wave action, 28.0, 29.8, 30.0, 28.8, 19.8 tons to sq. in.

The theory is that the gas first produced rushes with great violence to the projectile, is checked by its inertia, and thus wave action is set up, giving irregular and local pressure in the gun, but diminishing rather than increasing the velocity.

SOME EXAMPLES AND DEDUCTIONS.

The practical value of these definitions of the two classes of explosion of black gunpowder is less than that derived from a knowledge of the conditions which induce the more violent combustion and produce pressures beyond the limit a gun barrel can safely withstand.

The velocity of the propagation of reaction, tending toward detonation of black gunpowder, is found to increase with an increase of the initial temperature of the mass. It is well known that a gun that has been heated by firing improves slightly in its shooting; possibly this is not because the heat of the metal affects the small shot or rifle bullet, but because the barrel does not to the same extent absorb the heat generated by the burning powder, and so more work is got from the same charge.

It increases also with the weight of the charge, because in this case the influence of cooling is proportionately less. This is not likely to appreciably affect any variation in the charges of small arms, with which the limit of variation is comparatively slight.

It increases with the increase of pressure under which the gas is generated—that is to say, a powder has a tendency to detonate when too much work is required of it, as firing a bullet from a large powder chamber through a barrel of smaller diameter, as in the Martini, or by an obstruction in the barrel, or even by tight ramming of the powder, as too much turn-over of a paper cartridge case, or too firm fixing of the bullet in its seat.

"When the explosive is confined by 'tamping,' the pressure will rise very rapidly, and the velocity of propagation may give rise to a shock capable of detonating a portion of the mass. This is, no doubt, the case with long charges of small-grained powder ignited at the rear. The forward portion of the charge is jammed up against the projectile—for the grains at the back are consumed before those in front are ignited—the powder wedged between the hurnt explosive and the projectile is crushed, and that part at least is detonated, producing enormous local pressure at the base of the bullet, which probably has not moved very far from its original position in the cartridge chamber."

A characteristic example of this form of explosion came directly to the author's notice a few years ago with a .450 single "Express" rifle, with "Field" breech-mechanism, and the barrel chambered for the 3¼in. long taper solid drawn brass case, for a charge of 125grs. of No. 6 rifle grain gunpowder, and a bullet of 260grs. The owner of this rifle, after using it for some months, was induced hy a friend to employ a very fine-grained black gunpowder of foreign manufacture—the owner was living in the south of Europe—and to try 4½drs., or the full charge. After firing several shots at a target, another similar cartridge blew the rifle into fragments. Fortunately, the shooter escaped with nothing more serious than a severe injury to his hand. The cartridges were tested, and found to give normally thrice the pressure obtained, with the rifle grain powder fired under the same conditions; the rifle was strong enough to withstand this, but was not equal to a "detonation" of the charge, and that this happened the author has little doubt.

It is unlikely that fine-grained gunpowder, similar to No. 2, would be chosen by any sportsman, having a knowledge of its qualities, for use in a rifle, and of course, in the instance cited no hlame attached to the maker either of the weapon or of the powder.

If a sportsman must use fine-grained powder in an "Express" rifle, no larger grain being procurable, he runs the risk of possihle detonation of the charge and the probability of a burst; but the risk may be lessened by reducing the charge, leaving the powder loose in the cartridge. This method is usually practised in Germany when using a .450 Express rifle at small deer. The additional air space behind the projectile lessens the pressure, and of course the velocity, which is the object sought.

Normally this proper ignition and comhustion of the powder is obtained by using large-grained powder, the interstices between the grains affording the air space requisite to combustion at a low temperature.

Heavy charges of black gunpowder and increased loads of shot or weightier bullets do not usually burst any well-made gun, providing the explosion is of the normal type, for there is an ample margin of strength left to safeguard the sportsman from the results of occasional overloading. If a gun is repeatedly fired with charges producing strains it is not constructed to bear, it will bulge, crack, or burst; but the exercise of moderate care will prevent any such accident when black gunpowder only is used, and projectiles and cartridge cases of the usual type. In fact, black gunpowder of No. 4 grain for shotguns, and No. 6 grain for rifles, can hardly he so used with breechloaders as to cause stresses beyond those produced by the proof charges in making the compulsory tests to which the weapon has been subjected.

"A somewhat remarkable instance of the difficulty of obtaining very high pressures with black powder in barrels of 0.303 bore occurred at Enfield, in 1891, in the course of an experiment to ascertain the effect of hardening and tempering in diminishing wear and erosion. Barrels in the rifled stage were hardened in oil and reduced to spring temper. They were tested to ascertain what stress they would endure without bursting. The charges, both of lead and powder, were gradually increased to 1,700 grains of lead and 220 grains of powder without effect. A charge consisting of 200 grains of powder, a felt wad, an air space of 1in., a plug of clay 1in., then 2,700grs. weight of bullets—the latter occupying about 15in. of the bore—was fired. The load was forced forward ahout 6in., but still remained in the barrel. In this state two of the barrels were screwed to bodies and fired with service cartridge in the chamber. One only was bulged; the other burst at the rear of the impediment, but without moving it or affecting the breech mechanism. The burst was caused by a sudden local increase of pressure when the bullet struck the impediment. In the other instance, on opening the breech, the cartridge case was blown out by the imprisoned gas. The body and bolt were uninjured. There is no reason to suppose that the pressure exceeded 30 tons to the square inch, except the local pressure in the last trial."

THE RELATIVE STRENGTH OF EXPLOSIVES.

The explosives—other than black gunpowder—used in small guns for the most part consist of granulated gun-cotton. These powders are supposed to approximate black gunpowder in ballistic effect, and chiefly differ from it in producing a smokeless comhustion. The strength, or explosive force, as registered by firing in a closed vessel, of gun-cotton and black gunpowder is as 7.5 to 1. If the gun-cotton therefore was not toned down, or by some means caused to burn more slowly, it would be quite useless for employment in small arms. There is a possibility of these conditions or means not sufficing in some circumstances, and then pressures more nearly approaching the maximum strength of gun-cotton will he produced by the combustion. Unfortunately, all these nitro-compounds are more prone to "detonate" than is black gunpowder; their combustion is accompanied with greater heat, and they are more susceptible to slight changes in the method or intensity of the ignition. Another ingredient now entering generally into the composition of explosives used in small arms is nitro-glycerine, and the relative strength of nitro-glycerine to black gunpowder is as 10 to 1, and its susceptibility to detonation greater far than that of gun-cotton, though this quality is lessened by its admixture with other explosives, or non-explosive ingredients. The other point of first importance is the quality high explosives possess of generating heat in excess of that desirable for the combustion of the powder with best ballistic effect.

EXCESSIVE PRESSURE WITH NITRO-COMPOUNDS.

When gun-cotton or its chemical equivalent is taken as the hasis for an explosive to be used in small arms, it is usually granulated, and coated with some "deterrent" to retard the ignition of contiguous grains; the grains are usually small because each grain, when it is ignited, decomposes so rapidly that its explosion is practically a detonation. It does not burn from the outside to the center, as a pellet of gunpowder does; so to increase the size of each grain would tend to quicken the explosion instead of to retard it. The grains are rounded, instead of being angular, because that shape renders the ignition of each grain more difficult.

In other respects a charge of gun-cotton pellets, or of any similar nitro-compound, resembles in its behavior a charge of black gunpowder grains. If the load is too heavy, the combustion takes place within the cartridge chamber, and before the load of shot is started, and excessive pressures result. If too great a charge of the explosive is used, the heat generated is so much in excess of that needed that a part at least of the charge remaining is detonated, and excessive pressures result. In short, the ntiro-compounds may be said to give ballistic results similar to those obtained from the very fine grain black powder, and when used in small arms require to be used with care, discretion and knowledge.—From the Ninth Edition of "The Gun and Its Development," by W. W. Greener.

Montclair Gun Club.

MONTCLAIR, N. J., Dec. 31.—Something must have been wrong with the boys to-day, as all scores were frightfully low—20 the best during the entire afternoon. Perhaps it was the cold or the hazy atmosphere.

In event No. 1, Frazee won out with 20 breaks, getting the main trophy for the day, while in event 2, H. S. Sindle was high man with but 17 breaks. Crane and Atwater tied for first place in event 3 with 18 targets, while event 4 resulted in a tie between Frazee and H. S. Sindle.

The final event, a pick-up team race, 10 targets, per man, was won by Team No. 4, composed of Messrs. Crane and Winslow with a score of 17 out of a possible 20.

Events:	1	2	3	4	Events:	1	2	3	4

Rifle Range and Gallery.

Eastern Indoor League.

WASHINGTON, D. C., Dec. 24.—The first match of the season in the Eastern Indoor Rifle Shooting League was fired on Thursday night of this week, fourteen cities being represented in the schedule. Each club will fire one match with every other club, the matches extending until the middle of March. A similar league is also in progress in the West, and the winning team of each league will, at the end of the series, shoot a match for the United States club championship.

The results of this week's competitions are as follows:

Bangor, Me	904	vs. Atlantic City, N. J...	709
Birmingham, Ala.	919	vs. Savannah, Ga.	647
Bridgeport, Conn.	879	vs. Washington, D. C...	849
Butler, Pa.	864	vs. Providence, R. I.....	845
Portland, Me.	943	vs. Erie, Pa.	848
New Haven, Conn...	976	vs. Pittsburg, Pa.	905
Warren, Pa.	970	vs. New York City.....	953

Conditions governing the firing call for five men on a team, each firing 20 shots at 75ft. on a target with a 1¼in. bullseye, with nine concentric rings, the count being from 1 to 10. The competitors all fire prone and use .22cal. rifles without telescopes, and any ammunition. All of the matches are held under the supervision of range officers appointed for the purpose by the National Rifle Association of America.

Unofficial Returns U. S. R. A. League.

THE following are the scores in Match No. 1 of the U. S. Revolver Association, Dec. 18-24:

Manhattan	1108	vs. Philadelphia	1015
Stoneham	——	vs. Boston	1044
Belleville	——	vs. Century	1049
Newark	1055	vs. Osborne	565
St. Louis	1081	vs. National Capital	1058
Willow	1025	vs. Oakland	999
Youngstown	931	vs. Shell Mound	1017
Louisville	968	vs. Culebra	963
Columbus	958	vs. Myles Standish	961
Spokane	1051	vs. Smith & Wesson....	1081
Duluth	943	vs. Seattle	1051

ANOTHER YEAR HAS PASSED AND THE MARVELOUS SCORE OF

2481 OF A POSSIBLE 2500

made at Grand Rapids, Mich., in 1906 by W. A. TEWES, with

Peters SEMI-SMOKELESS CARTRIDGES

Still stands as the **WORLD'S RECORD** in .22 cal. indoor Shooting. SEMI-SMOKELESS Ammunition, for nearly 15 years, has **defied competition** and **imitation.** It is the **original** and **only** SEMI-SMOKELESS—others have tried to produce something just as good, but have failed and are ever sure to fail, because SEMI-SMOKELESS powder is protected by patents, and The Peters Cartridge Company is the only company having the right to load it in cartridges and shells. PETERS Rifle and Revolver cartridges, excepting of course the smokeless sizes, are loaded with SEMI-SMOKELESS only (not a grain of black powder), but are sold at the same price as ordinary black powder goods.

PETERS SEMI-SMOKELESS cartridges have **made good,** and have won their present leading position in the ammunition world on **merit.** The Indoor Shooting season is now in full swing, and in deciding upon your ammunition, do not be misled; specify PETERS SEMI-SMOKELESS and your dealer will understand. Do not accept a substitute, but stick to the kind that has made and now holds the most important world's records. and that has done more than anything else to make possible the marvelous improvement in scores, and the greatly increased popularity of Rifle and Revolver target shooting.

Rapid Fire Shoot at Los Angeles.

SIX members of the Los Angeles Rifle and Revolver Club met at the Glendale range in Los Angeles on Dec. 18, for the purpose of working out a new rapid fire system, devised by Stewart Edward White, the well-known writer, who is a member of the club. A new muzzle rest was also initiated by the members, wishing to try out new loads or check up the accuracy of their rifles. In the timed fire system, the object of the inventor was to get away from the old slow fire military style of shooting, and to encourage speed of fire as well as accuracy. In the plan the member stands to the ready until the command to fire is given, when he throws his rifle to his shoulder and fires as quickly as he can and still hit the target at 200yds.

The time between the command and the discharge is noted. For each second over 18 seconds one point is taken away from each shot, and for each second under 18, one point is added.

Timed fire, 200yds., "A" military target:

	Score.	Time. (secs.)	Time prem.	Total Score.
E C Crossman	18	10	32	50
	19	11	35	54

Annual Awards of California Schuetzen Club.

THE California Schuetzen Club, one of the oldest in the State, founded in 1876, held its closing contest for the year in California Schuetzen Park on Dec. 18. This is the club which was originally organized to send a team to the Centennial Exposition at Philadelphia in 1876, and which had the satisfaction of having its team capture the highest honors at the international competition there.

F. O. Bratton this year made the highest score in the yearly handicap competition, winning the first bullseye premium on a score of 46 from the dead center, and the top prize for the best bullseye of the year. Frank H. Bremer made the ten highest scores of the year in the medal competition; Otto A. Bremer made the highest single ten-shot score of the year. Wm. F. Blasse won the medal in the pistol competition.

The Philadelphia Rifle Association.

PHILADELPHIA, Dec. 31.—The weekly competitions of this Association were shot to-day on the Arlington range, Lansdowne avenue and Cedar lane, near Llanerch, Pa. In spite of the cold weather, there was a fair attendance at the range, and some good scores shot. This was the closing shoot for 1910, and with the exception of Feb. 22 the guns will be out of use until the opening day in April.

Record match, 200yds., rifle: Geo. Schnerring 214, 210.

Honor target, 3 shots: Geo. Schnerring 23, 14, 21; Williamson 14, 19, 22.

Fifty-shot match: Geo. Schnerring 222, 216, 215, 210, 200.

Military match: Williamson 43, 43, 41, 41, 40.

Revolver match, 50yds.: H. A. Dill 86, 85; Dr. Dubbs, 84, 82, 81, 80; Horace Beebe 59.

Pistol match, 50yds.: H. A. Dill 83, N. Spering 89, 88; Horace Beebe 74, 54.

MANY MISSES.

THE hunt came about in this wise. Frank, "Ruf" and "Gi" had been out for the day and brought home seven woodcock and two partridges. So when during the evening chat Jake suggested that he and I go out the next day I agreed at once. We first drove about five miles to a very good looking ground, and hitching our horse to the fence hunted through the alders on each side of the creek without finding a bird. Coming back, we hunted along the edge of some woods near the creek and alders, where it was swampy, and there was an occasional bunch of alders. As we walked by one of the bunches we heard a woodcock whistle, but did not see him. We called the dog, who was working closer to the woods; he came and promptly nailed the bird in an adjoining clump. We got into position and Jake ordered the dog to flush him. It was Jake's shot and he killed with the first barrel. As this was the end of this ground and it was after noon, we went to the buggy and ate our lunch, while our horse was eating her grain.

Lunch over with, we started for a ground famous for woodcock. The mare knew what we were after and pulled up at the post in the fence where we always hitch.

The grounds were very wet, and I was thankful that I had taken the precaution to wear hip boots. The dog splashed around, and soon disappeared in some very thick alders; and as he did not come out when he naturally would in quartering his ground, we knew he had located a bird. Jake was on one side of the alders and I on the other. I called to Sim to order the dog to "put 'em up," which he did, and away went the bird. I caught a glimpse of it and fired, but failed to stop it. Jake said he "did not see it, but from the noise it made getting up out of the bushes thought it was a partridge." After correcting his ideas on this point, we moved on as far as a creek, which was too deep to wade, so we decided to hunt up the creek on the side we were on. As we turned to start I asked Jake where the dog was. He did not know and began to call and whistle. After a while he came to us and Jake ordered him on, but he at once turned and started back in the direction he had just come from, looking at us the while as if he wanted us to go with him. I said, "Jake, he has a bird back there." Sure enough, after going a few rods, he circled around a bunch of alders and came to a handsome point. I immediately wallowed through the mud and water to an open spot, and as soon as I got in position Jake walked in and put up the bird, which did not fly exactly as I had calculated, but I fired through the alders. A second later Jake fired, and I tried again with my second barrel. I thought I saw the bird fall on the other side of the alders, but a search failed to find him, so we concluded that we had both missed.

We hunted down the creek for some distance, but the dog did not show game; so I decided to go back to where I thought I saw the bird fall, and take another look. After I had been there some little time without finding him, I heard Jake calling me; and I hurried to him. As soon as I got there he said, "There is a bird in here somewhere; you go out there," pointing to an open spot, "and I will stay here." When we were in position he ordered the dog on, and he flushed a bird, which Jake missed with both barrels, a beautiful right-quartering bird.

I then started down the creek, on the bank of which at this place was a thick fringe of cedars. Up went a woodcock from among the

cedars and crossed the creek without showing himself. I was soon across with the dog, while Jake kept on the other side. Working into the alders, the dog soon made game, and after a few moments came to a point. I called to Jake to get ready, and went to an open spot from where I tried to make the dog put up the bird; but the dog would not move. I walked in front of the dog, and all around him outside a radius of eight or ten feet, but no bird went up. I then went nearer, and got so near that I could touch the dog with my foot, which I did standing beside him, and urged him to go on. At this the bird sprang up between us with a whirr and a whistle. I quickly raised my gun to shoot, and at the same instant the dog made a spring at the bird (something he was never known to do before), but missed him. As I saw the dog jump, I threw the muzzle of my gun up just as I pulled the trigger, to avoid shooting him, and of course missed my bird, which was flying very low and sailed toward Jake, who promptly fired and dropped him into the creek.

I was floundering along about half way back to where we started in, when up went a woodcock. I fired, as I always do when I see the bird, and again scored a miss. The dog was on the other side with Jake. I tried to get him to hunt with me, but he would not stay; so I wallowed alone. I had thought the walking was bad before, but soon after flushing the bird I went to my knees at nearly every step in black mud and water, and finally made a spring to escape a particularly vicious looking hole, and as I landed I could feel my left foot sinking into the mud until it nearly ran over the top of my hip boot. I mechanically dropped on to my right knee and tried to pull the other leg out, but I was stuck. Within reach of me was a rotten stump, against which I leaned my gun, and off of which I broke pieces to place under the knee that was on top. These supported me if I kept quiet, but when I put any pressure on them they broke. I saw a long piece of drift wood that looked as if it would bear my weight; this I reached after an effort, and just as I got a firm hold and began pulling it toward me, up went that woodcock from near the other end of it. I suppose he had been sitting there and chuckling to himself over my dilemma. I thought so anyway, and hastily reaching for my gun, cut loose on him at long range without ruffling a feather. In a moment or so after I fired I heard Jake say, "What did you shoot at?" and there he was on the other side of the creek laughing at me.

I soon got the long stick under my knee and hoisted myself out; then went directly to the bridge, which was near, and crossed over to Jake. We then worked through some cedars up the creek until we struck the alders again. The dog went in with a rush down the wind, and was not fairly in the brush before he flushed a woodcock, which flew low so that we did not see him. If there is one at this place there are always more. The dog soon pointed where we could see him on his point; and as Jake had killed all the birds so far, he said he would go in and flush the birds, while I was to remain on the high ground and do the shooting. He went to the dog; then commenced some of the finest work by the dog that I have been permitted to see in some time. He would work along very carefully for a short distance; then stop and cautiously turn his head to see if Jake was coming; then move a few steps further; stop again and look. I could only account for his actions by the thought that possibly there had been a large flight of birds there that had gone that morning, leaving a very strong scent. After going through this performance several times, and covering about six rods, he came to a point. Jake thought he was over-cautious and was stopping again, so he told him to go on. This he refused to do, and Jake called out to me to get ready, as he guessed there were two or more birds straight ahead. I secured a good position, and Jake walked a few steps ahead of the dog, when up went a bird. He did not come my way, but gave Jake a good snapshot, and he killed. The dog took a step or so

YOU know mallards—wisest and wariest of all ducks—Solomons of the air. You can't knock down mallards with a paddle nor can you get them with a gun that plasters its shots all over the face of creation.

A mallard shot is generally a long shot, and long shots require a hard-shooting, close-shooting gun.

That's why the long-headed man who goes to a mallard country takes a Lefever. When he swings it on a towering pair of mallards he does not question the result. He know it—

TWO CLEAN KILLS

The reason a Lefever kills clean and sure and far is **Lefever Taper Boring.**

But if you buy a Lefever for the taper boring alone, you will get more than your money's worth. For instance, you will never be handicapped with looseness at the hinge joint. The exclusive Lefever screw compensates for a year's wear by a trifling turn that you make yourself with a screwdriver.

LEFEVER SHOT GUNS

Sixteen other exclusive Lefever features and Lefever simplicity and strength make the $28 gun the peer of any $50 gun on the market. Upwards to $1,000. Send for free catalog and get Lefever wise.

TRAINING vs. BREAKING.

Practical Dog Training; or, Training vs. Breaking. By S. T. Hammond. To which is added a chapter on training pet dogs, by an amateur. Cloth, 165 pages. Price, $1.00.

FOREST AND STREAM PUBLISHING CO.

and froze again. Jake walked the bird up; he was a strong flyer and went some distance before he rose above the alders. As soon as he did I fired. It was a long shot and I scored another miss.

Jake picked up his bird and told me to come where he was. I went, and we hunted for the one I had just missed. We had only hunted a short distance before up he went in the safest place in the world for him—among thick alders. I tried a snap shot and missed; then remarked that "we would leave him for seed." Jake replied: "From the number of misses you have made I should think you intended seeding rather heavy." Jake now had three birds and I none, so I felt that I must retrieve my lost reputation as a fair wing shot.

We took the dog over to another likely looking place on the same ground, and soon heard a bird get up, but did not see him until as he came to the ground, we marked him and got in position. We had no sooner done so than he flushed wild, and gave me a left-quartering shot. I looked square at the bird and quickly brought my gun to my face, so that I saw the top of the barrels on a line with the bird. Then I pulled the trigger, and had the satisfaction of seeing my first woodcock for the day tumble to the ground near a cedar. He had looked very large on the wing, but when I picked him up he exceeded my expectations by proving the largest and handsomest woodcock I have ever killed. Jake remarked that if he had not been so large I would have missed him. The only shot mark to be seen was a scratch on his lower mandible. I decided to have him mounted.

After walking some distance to the next patch of brush, the dog went in and flushed a partridge. Jake had a snap shot, but failed to kill. Soon after this we turned, and crossing the creek on a slippery log, went back on the other side. We did not find any game until we arrived at the place where the last woodcock I shot at and missed had alighted. The dog found him, and Jake did not see the bird until he was just going by the open place below the clump of cedars. He fired at long range, and was not positive as to whether he killed or not.

A search by the dog and man, however, failed to find a bird, live or dead, so we concluded that he had escaped unscathed. When we hove in sight of the mare we were greeted by a whinny which plainly said: "I am glad you have come; it is time to start for home."

WAYS OF THE SNARER.

"ONE of the most important errands certain residents of our backwoods districts have in town at this season of the year," said a citizen of an up-country county, "is the purchase of ammunition and things that may be brought into use along about this time of year. If any one curiously inclined should happen to be present in the stores patronized by these way-back folk when they are selecting their material he could not fail to observe that many of the purchases include several yards of copper wire not much thicker than coarse linen thread, but of great strength and flexibility.

"If the curious person were a stranger he would doubtless wonder what part in the uses of a sportsman's outfit this wire was intended to play, and if his curiosity should make him bold enough to inquire of the purchasing citizen what that use was he would in nine cases out of ten be told that the wire was to be used in 'mendin' things.' But if this curious person should happen to be one acquainted even slightly with the methods of certain backwoods dwellers he would not need to be told that the true service the copper wire was to be in the shape of a delicate but infallible destroyer of the partridge.

"The wire is made into snares, which are set in unsuspected number about the places where this bird feeds and hides and which annually kill hundreds of the birds in spite of the law. These snares are placed on the ground in the birds' favorite feeding places, and on decayed logs,

which are persistent resorts of the partridge, the cock bird especially making them his favorite promenading ground. The wire is made into a slipping noose, which is suspended above the ground or log, and spread out so that the bird in walking thrusts his head and neck through it. The pressure of his body against it as he walks on draws the noose to and the bird is soon strangled.

"When the snare is set on the ground little pens are built by making a miniature fence by sticking twigs in the ground around three sides of a space three or four feet square. One end of the pen is left open. In the other end a small space is left in the center of the fence. In that opening the snare's noose is suspended. The bird in making its way along walks into the pen at the open end. The sides of the enclosure keep it headed straight for the open space at the other end of the open, where the noose is hanging. As the unsuspecting bird passes out through that opening it is caught by the wire and strangled to death.

"The partridge killed by these wire snares during a year in that region amount to many hundreds. Sportsmen and others tramping through the woods and among other haunts of this game bird discover and destroy many of the snares, but not one in ten is ever detected. As this illegal method of killing this greatest of American game birds has got in its destructive work for many years, rivalling the onslaughts of the fox, weasel, hawk and other natural enemies of the bird, the wonder is that the game is still to be found at all in any of its old-time haunts, but it is there yet in astonishingly large numbers.

"And speaking of this snaring of partridge reminds me. One of my fellow citizens who stands very high among us for probity and general estimable qualities, and who kept his dog and his gun and almost invariably came in with a nice bag of partridges, to the envy of us less fortunate hunters, has this fall not indulged himself at all in his favorite sport. If there ever was one among us who railed fiercely and at all times against the copper wire snare and its patron, it was this most estimable fellow citizen of mine.

"I was out one day after birds and luck hadn't come my way. As I was trudging through the woods I came to a copper wire snare set among some old grapevines, a likely place for a snare to get in its deadly work, which this one had done, for hanging in the noose was a fine hen partridge. My first impulse was to tear out the snare, but it struck me it would be a good idea to lie in wait and find out who had set it, as he would doubtless be coming along after a while, looking over his line of traps, for it wasn't likely that this was his only one. So I hid in the bushes and waited.

"I didn't have to wait long. The owner of the snare came quietly out of the woods and made straight for the snare. He had a gun and his dog was with him. He also had, as I could see by its bulge, his bag well filled with game. He took the bird out of the snare I had discovered, set the snare again, added the bird to his bag and was going on when I stepped out. Nobody could have been more surprised and taken aback than he was except myself when I saw who the owner of the snare was. It was my highly esteemed fellow citizen whose indignation against copper wire snares and snarers had always been so great!

"What could he say? Not much of anything, I think. But I know he would rather have given a thousand dollars that minute than have me or any one else there. I never had the heart to expose the highly esteemed citizen, but he quit going hunting, ardent sportsman as he had been, and every one of his fellow citizens except me wonders why."—The Sun.

All the fish laws of the United States and Canada, revised to date and now in force, are given in the Game Laws in Brief. See adv.

The "Old Reliable" PARKER GUN

Wins for the **EIGHTH** Time

The Grand American Handicap

Score of 100 Straight from 19 Yards.
At Chicago, Ill., June 23, 1910.

Mr. Riley Thompson, of Cainsville, Mo., made this record, which has never before been equaled in this classic event.

The **Parker Gun,** in the hands of Mr. Guy V. Dering, also won the Amateur Championship at Chicago, June 24, scoring 189 ex 200, shooting at 160 singles and 20 doubles.

The Prize Winners and Champions shoot **The PARKER GUN!**
Why don't **YOU?**

PARKER BROS.

New York Salesrooms: 32 Warren St. **Meriden, Conn.**

The ***Marlin*** *Repeating Shotgun* — *12 GAUGE*

Made famous by its dependability. The solid top and side ejection keep gases and powder away from your eyes; help quick, effective repeat shots. Rain, sleet, snow and foreign matter can't get into the action.

The mechanism is strong, simple, wear-resisting. The double extractors pull any shell instantly; two special safety devices prevent accidental discharge while action is unlocked, and an automatic recoil block makes hangfires harmless.

All Marlins are strongly made, finely balanced, accurate, hard hitting guns, and are the quickest and easiest to take down and clean. Illustration shows Model 24 grade "A" 12 gauge; it has all the features that make for a perfect gun

Send three stamps postage today for our 136 page catalog, describing the full *Marlin* line.

THE NARRATIVE OF A SPORTSMAN

INTER-OCEAN HUNTING TALES

EDGAR F. RANDOLPH

A series of hunting reminiscences of rare charm for the sportsman and for the wider circle which delights in true tales of outdoor life. With none of the high coloring and exaggeration which give a false note to so many hunting stories, Mr. Randolph's book is never lacking in interest.

He covers the field of sport with the rifle, east and west, drawing a vivid word picture of life in the open, subordinating his own exploits to the main incidents of outdoor experience, giving much valuable information on camp life, hunting and the habits of wild game, and continually delighting the reader with the freshness of his viewpoint.

This book will strike a sympathetic chord in the memory of every big-game hunter of experience and will prove of real value to the novice who is planning an excursion into the wild.

Cloth, 170 Pages. Richly Illustrated. Postpaid, $1.00.

FOREST AND STREAM PUBLISHING COMPANY, 127 Franklin Street, NEW YORK

A Logical Sequence

1. A supply of shells loaded with any one of the Du Pont Sporting Powders.
2. A chance to shoot with an up-to-date gun club.
3. The perfect enjoyment of a sport that appeals to the manly man. That is invigorating and that makes you over for the following day's work.

Have you a Gun Club in your town? If not, let us help you organize one.

A postal from you will have our best attention.

Rhymes of The Stream and Forest

FRANK MERTON BUCKLAND

One of the freshest, most delightful collections of outdoor verse offered for many a day. They are the outpourings of a spirit which loves nature, the woods and streams and growing things, and appreciates its charms.

Mr. Buckland's verse has a charm that is at once rare and delightful. This book will appeal to every outdoor man or woman, and particularly to the "Brethren of the Angle."

Its form is as attractive as its pages, closely simulating the appearance of the standard fly-book, printed on heavy laid paper with ornamental border designs of trout flies, pocket for clippings, and blank pages for copying or individual composition. It is just the thing for the den, for the pocket, or for a gift to the friend who loves the big world out of doors.

Postpaid, $1.25

FOUR BEARS.

William Misner, of Frost Valley, proved himself the banner bear hunter of the Catskills this winter by shooting four bears recently on Graham Mountain along the West Branch of the Neversink. Misner took the bears down to Kingston and was about town looking for a purchaser, says the Catskill Daily Mail. It is not often that a bear hunter is as fortunate as Misner in getting four bears at once, and in as short a time, for he was on their trail less than four hours when he found where they had holed up.

He struck their tracks in the snow just below the dam at Winnisook and followed them around the side of Hemlock Mountain down the West Branch to Rock Brook, where they followed up the stream to a ledge on the side of Graham Mountain. He had not followed their tracks far along the side of this ledge when he saw about twenty rods ahead of him where they had gone into a cave. As he stood watching the mouth of the cave wondering how he could best approach it without alarming the bears, one of them came out on a run and started up the side of the mountain. Misner was prepared for just such a move, and, as the bear started across an opening in the brush about twenty-five feet from the cave, fired, hitting it in the shoulder. The bear dropped to the ground, but was up again in less than a minute. As it started off Misner fired again, hitting it in the head and killing it.

After determining that the bear was dead, Misner set about trying to get the other three. He crawled in the cave a short distance to make sure there was no other opening for the bears to go out by, then formed his plan to get them out. He found there was a rock across the end of the crevice that could be pried away with a crowbar, so after firing five or six shots in the cave he gathered a lot of rocks and walled up the mouth. After fixing this so he was sure the bears could not throw it down, he went home for a crowbar. This he got, and secured two other men to help him. When they reached the cave it took but a short while to pry away the rock at the end of the crevice. When this was done, the stones were removed from the mouth of the cave, and while one of the men went into the crevice and drove the bears down to the mouth of the cave, Misner shot them as they appeared.

The first bear shot proved to be the mother and the others were cubs. The she bear when dressed weighed 164 pounds and the cubs 52, 58 and 61 pounds. Had the cubs been smaller the she bear would probably have put up a fight, but as they were well grown, her object in running away was to get the hunter to chase her and allow the cubs to escape.

PHEASANTS TOO TAME.

Out of some 6,000 English pheasants distributed in various parts of Missouri late last summer by State Game and Fish Commissioner Jesse A. Tolerton, reports have been received from all but fourteen shipments, according to a Missouri paper. In these latter cases it appears that nothing has been seen of the birds since they were liberated. In the case of all other shipments reports are satisfactory.

One thing that is worrying Mr. Tolerton not a little is the fact that in a number of instances these birds show a disposition to become domesticated. Many persons to whom he shipped the birds report that they are disposed to stay about the barnyard and in some instances have become almost as tame as chickens. Whether this will continue when the mating season arrives Mr. Tolerton does not know, but the presumption is that in the spring the birds will pair off and seek the woods and fields for nesting purposes. But should it develop that these birds become thoroughly domesticated, their value to the sportsmen will deteriorate, for there would be no more sport in hunting them than in going into a chicken yard and shooting chickens.

GAME IN THE ADIRONDACKS.

GLENS FALLS and vicinity people who have recently journeyed through the lower Adirondack region report that game is unusually plentiful. Very recently several residents of this city who have driven through the stretch of country between Long Lake West from Utica to Montreal, and the village of Long Lake, a distance of twenty miles, in Hamilton county, were surprised at the number of forest animals which they encountered on their journey and which showed no signs of alarm or timidity at the approach of strangers.

On the trip out, while driving along the roadway a large cow elk and two half-grown specimens of its young were encountered. All three animals turned out as complacently as barnyard animals to let the travelers pass. After the vehicle had proceeded on its way, the animals halted at the roadside and gazed back in curiosity at the travelers. Teamsters along the road, who were met afterward, stated that game of all kinds is unusually plentiful.

A short distance further along the road the travelers passed a big buck deer. The noble animal was complacently lying in a clump of bushes. The driver yelled at the animal, which sprang to its feet and ran away. Still further on a buck and a doe were encountered. A large beaver colony is quartered on Tupper Lake, a portion of the Whitney preserve, which consists of ninety-seven thousand acres, of which twenty-seven thousand is water.

In this connection it should be stated that beaver in the State generally are more plentiful than heretofore for the reason that some time ago, owing to the gradual disappearance of beaver due to the work of trappers, a State law was enacted making the trapping, shooting, possessing or interfering in any way with beaver in this State illegal and punishable by a fine of one hundred dollars for each offense. The law also authorized the colonizing of beaver for the purpose of propagation. This law was passed four years ago and it is estimated that one year ago there were five hundred beaver in the State.

Another wild species, which has already been reported by old guides is the timber wolf which has appeared in the forests of the Long Lake section. One old guide, a few days ago, described the playful antics of two timber wolves which he observed running on the beach along the lake. Both animals gamboled like two dogs, running and jumping over each other in a most care-free manner. The tracks of deer crossing the roads are reported as thick as cattle tracks in the vicinity of farmers' barns.

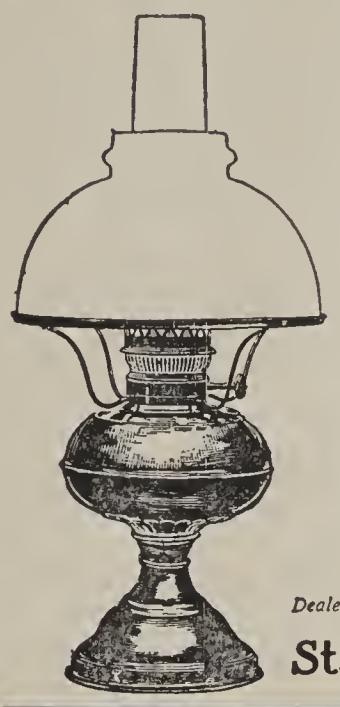
A few years ago the owner of Littlefield Park, a tract of land covering 6,000 acres, imitating the example of Dr. Seward Webb, who tried to fence in the deer in his preserve, built a large, strong wire fence around his tract of land and turned out a herd of wild boars in the corral. It is claimed, however, that the wild boars liked the palatable meat of the deer on the Webb preserve and therefore refused to remain fenced in and that at the present time a larger herd of wild boar are roaming wild in the forest preserve at the outlet of Long Lake, a beautiful body of water thirteen miles and a half long.—Glens Falls Times.

FROG LEG INDUSTRY IN CANADA.

ACCORDING to estimates which are reliable, though not official, says Consul Andrew J. McConnico, St. John's, Quebec, the frog leg industry is worth to the Province of Quebec at least $100,000 annually. During 1909 the Montreal markets disposed of over $200,000 worth of frogs' legs, of which probably more than 50 per cent. were produced in this Province. The local market prices averaged forty cents per pound.

There are numerous rivulets and marshes in this Province in which frogs abound, and during the proper season many boys and men earn a fair livelihood catching frogs. Most of the shipments from this consular district go to Boston and New York, usually in small quantities.

The Famous Rayo



Does Not Strain the Eyes

Don't use a small, concentrated light over one shoulder. It puts an unequal strain on your eyes. Use a diffused, soft, mellow light that cannot flicker, that equalizes the work of the eyes, such as the Rayo Lamp gives, and avoid eye strain.

The Rayo is designed to give the best light, and it does.

It has a strong, durable shade-holder that is held firm and true. A new burner gives added strength. Made of solid brass and finished in nickel. Easy to keep polished. The Rayo is low priced, but no other lamp gives a better light at any price.

Once a Rayo User, Always One.

Dealers Everywhere. If not at yours, write for descriptive circular to the nearest agency of the

Standard Oil Company
(Incorporated)

NEWFOUNDLAND

A Country of Fish and Game. A Paradise for the Camper and Angler. Ideal Canoe Trips.

The country traversed by the Reid Newfoundland Company's system is exceedingly rich in all kinds of fish and game. ¶All along the route of the Railway are streams famous for their SALMON and TROUT fishing; also Caribou barrens. ¶Americans who have been fishing and hunting in Newfoundland say there is no other country in the world in which so good fishing and hunting can be secured and with such ease as in Newfoundland. Information, together with Illustrated Booklet and Folder, cheerfully forwarded upon application to

ANGLING MEMORIES

Seasonable Books for the Sportsman's Library

MEN I HAVE FISHED WITH — MY ANGLING FRIENDS

Both by FRED MATHER

These two volumes are a source of endless delight to the fisherman. They deal with every phase of the gentle sport from bent pins and willow poles to salmon flies and special rods—with every kind of fish as well.

They are full of a quaint philosophy, written with a rare appreciation of human nature, and comprising sketches of angling "characters" as well as well-known men who were Mr. Mather's brethren of the angle. Much of other sport and adventure beside fishing will be found between the covers of these books. These two large, splendidly bound, splendidly printed, and richly illustrated volumes of 400 pages each regularly sell for $2 each. While they last we offer

Both together, postpaid, for $3.00

FOREST AND STREAM PUBLISHING COMPANY, NEW YORK

A Classic for Sportsmen

AMERICAN BIG GAME IN ITS HAUNTS

Boone and Crockett Club Series

Edited by GEORGE BIRD GRINNELL

An invaluable work not alone for the sportsman, but for the student and lover of wild life. Treats of big game preservation and protection in the broader sense; tells of the habits, habitat and life history of the larger wild animals; touches upon the problem of the public forest domain, and is rounded out by interesting hunting reminiscences by such leaders in the fraternity of big-game hunters as Madison Grant, Paul J. Dashiell, George Bird Grinnell, Jas. H. Kidder and W. Lord Smith. Bound in cloth, library edition, heavy paper, richly illustrated, 497 pages.

Postpaid, $2.50

A noted game preserve fronting James River. Owner absent this year. A grand chance for a yachtsman to entertain his friends. Send for records of previous annual hunts and terms of rental. Address RICHARD EPPES, City Point, Va.

Winter Sport with Rod and Gun

Sportsmen, spend your winter vacation here. All kinds of hunting, from panther to duck; exciting game fishing; fighting tarpon in the bay; big mouth black bass in river. Booklet sent free. Correspondence invited. Address T. D. BRIGGS, Prop.

The Rendezvous, Homosassa, Fla.

Sam Lovel's Boy.

By Rowland E. Robinson. Price, $1.25.

Sam Lovels' Boy is the fifth of the series of Danvis books. No one has pictured the New Englander with so much insight as has Mr. Robinson. Sam Lovel and Huldah are two of the characters of the earlier books in the series, and the boy is young Sam, their son, who grows up under the tuition of the coterie of friends that we know so well, becomes a man just at the time of the Civil War, and carries a musket in defense of what he believes to be the right.

FOREST AND STREAM PUBLISHING CO.

Nursing vs. Dosing.

A Treatise on the Care of Dogs in Health and Disease. By S. T. Hammond ("Shadow"), Author of "Training vs. Breaking." 161 pages. Cloth. Price, $1.00.

Mr. Hammond believes that more dogs are killed by injudicious doctoring than by disease, and the present work is a protest against the too free use of medicine when dogs are sick. The author has given especial attention to many of the troubles which especially afflict small dogs kept in the house, and likely to suffer from lack of exercise and from over-feeding; and boys and girls owning dogs—as well as children of larger growth—may profitably study and ponder this volume.

Contents: Importance of Nursing. Cleanliness. Out-of-Sorts Dam. Puppies. Diet. Other Foods. Kennel and Exercise. Common Ailments. Teething. Diarrhea. Convulsions. Epilepsy. Distemper. Eczema. Need of Proper Care. Sour Stomach. Vermin. Canker of the Ear. Mange. The Nervous System. Abscesses. Colic. Worms.

FOREST AND STREAM PUBLISHING CO.

A Problem's Solution

LOG CABINS & COTTAGES;
How to Build and Furnish Them.

A seasonable book when all minds are bent on the problem of getting close to nature. Mr. Wicks in this delightful book offers timely advice to every one who wants to build a simple summer home at one with its surroundings of wood or stream or shore.

This is a thoroughly practical work, treating of the how, the where, and the with what of camp building and furnishing. It is helpful, too, in regard to furnishing, and withal a most beautiful work.

Cloth, profusely illustrated, $1.50 postpaid.

FOREST AND STREAM PUBLISHING CO.

His Best Book

MY FRIEND THE PARTRIDGE

By S. T. HAMMOND

This delightful presentment of the glories of Autumn days with gun and dog in the crisp New England woods in search of the noblest of native game birds, which has already delighted thousands of readers of FOREST AND STREAM, is now ready for delivery in book form.

Mr. Hammond knows his upland coverts as no other writer of the day. He makes no empty boast when he calls the partridge his friend, and, moreover, makes his every reader a friend of this splendid bird. He succeeds in a rare degree, not only in describing the ruffed grouse, its habits and habitat, and the pleasures of its pursuit, but in surrounding his reader with the very atmosphere of the leaf-scented Autumn woods. Mr. Hammond's book is a welcome addition to the library of sport.

Cloth. 150 Pages. Illustrated. Postpaid, $1.00

FOREST AND STREAM PUBLISHING CO., 127 Franklin Street, NEW YORK CITY

PLANNING A HOUSEBOAT

Will be a leisure-hour occupation in many a family this winter. Houseboating has come among us to stay, and promises to be even more popular than in England itself. Every one who is interested in houseboats or who contemplates taking up this feature of outdoor life, should read Mr. Albert Bradlee Hunt's practical, and, at the same time, beautiful work on the houseboat and its adaptation to American waters.

HOUSEBOATS AND HOUSEBOATING

Covers the entire range of its title, considers the use and opportunities of the houseboat; their relation to city and suburban life; construction, furnishing, motive power, and all the thousand and one details, the knowledge of which spells the difference between success and failure in houseboat building and houseboat life.

Details, plans, drawings and specifications illuminate the text, while life on houseboats is interestingly described. Some of the more noted English and American houseboats and the life thereon are also described at length with illustrations. Buckram, heavy paper, sumptuously illustrated.

Postpaid, $3.34

FOREST AND STREAM PUBLISHING CO., 127 Franklin Street, NEW YORK CITY

AMERICAN BIG-GAME HUNTING

BOONE AND CROCKETT CLUB SERIES

Edited by George Bird Grinnell and Theodore Roosevelt

A thoroughly stimulating book dealing with American big-game hunting, East, West and under the Arctic circle, including every phase of sport with the rifle. "American Big-Game Hunting" is a compilation of the experiences of some of the most widely known sportsmen in America. Among the sketches are: The Story of the Buffalo, Capt. Geo. S. Anderson; The White Goat and His Country, Owen Wister; Old Times in the Black Hills, Gen. Roger D. Williams; Coursing the Pronghorn, Theodore Roosevelt; After Wapiti in Wyoming, F. C. Crocker; In Buffalo Days, George Bird Grinnell; Blacktails in the Bad Lands, B. Rumsey.

Forest Preserves and Game Refuges are also considered. Aside from the surpassing interest of the narratives, the book is invaluable for referenc. Cloth, heavy paper, library edition, richly illustrated.

Postpaid, $2.50

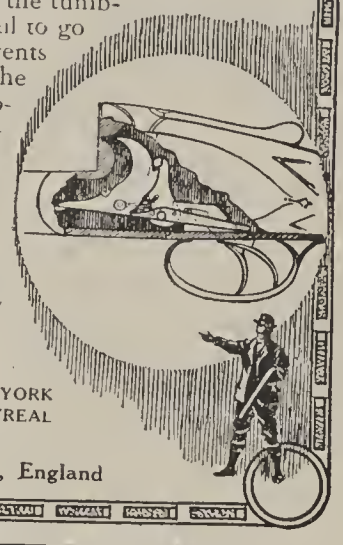
GUNNER GUMPTION'S
LANTERN LECTURETTES ON

GREENER GUNS

The Greener Tumbler Bolting Safety.—Of course you are convinced that the Greener Side safety is a sine qua non of the perfect gun, yet to make assurance doubly sure your gun should be fitted with an internal or "tumbler bolting" safety, operated automatically and entirely independent of the shooter's volition. A safety that will safeguard the user of the gun and his companions against all risk of accidental discharge.

The Greener Tumbler Bolting Safety is almost human in its ingenuity, yet consists of but two limbs operating in such a manner that it is a mechanical impossibility for a Greener gun fitted with this safety to be fired unless the triggers are actually pulled Should the locks by any mischance jar out of bent, the "silent sentinel" checks the fall of the tumbler instantly and effectually. Should the tumbler through dirt or other cause fail to go properly into bent, the safety prevents its fall upon the cap. When the trigger is pulled voluntarily, a projection of the trigger blade depresses the rear end of the Safety, lifting it clear of the tumbler's path and permits the gun to be fired in the usual manner



Look at the drawing, it explains the simple working of the device exactly; of course you will have this safety fitted to your new Greener gun. *Catalog free.*

American Duck Shooting

By GEORGE BIRD GRINNELL

No single gunner, however wide his experience, has himself covered the whole broad field of duck shooting, and none knows so much about the sport that there is nothing left for him to learn. Each one may acquire a vast amount of novel information by reading this complete and most interesting book. It describes, with a portrait, every species of duck, goose and swan known to North America; tells of the various methods of capturing each, the guns, ammunition, loads, decoys and boats used in the sport, and gives the best account ever published of the retrieving Chesapeake Bay Dog.

About 600 pages, 58 portraits of fowl, 8 full-page plates, and many vignette head and tail pieces by Wilmot Townsend.

Price, library edition, $3.50.

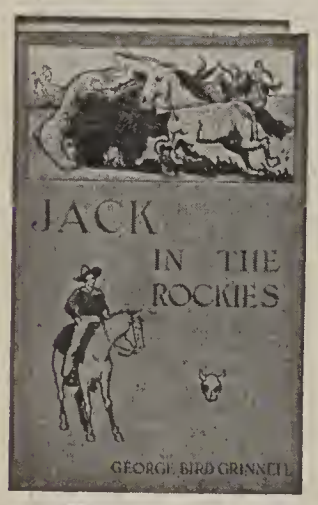
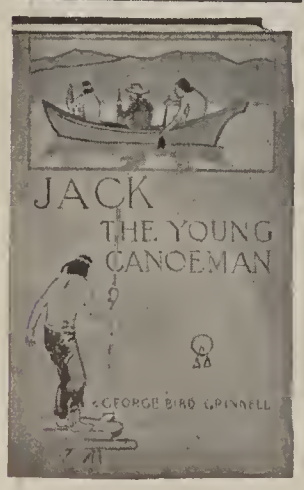
THE JACK SERIES

Best Books For Boys

By GEORGE BIRD GRINNELL





THE solution of the parents' problem of providing for the growing boy reading at once healthy and satisfying to his craving for action and adventure. In the Jack Books the longing of the normal boy for Western stories is gratified, the interest is absorbed and the mind is unconsciously led to phases of life that are elevating and instructive.

The books are the story of a young New York lad, sent to Stillwater ranch in the Rockies for his health, who becomes the companion of a veteran of the frontier. For each of six succeeding years he is led through new territory and experiences, accumulating much of the lore of plain and mountain, enriched with tales of the old West.

Ranch life, travel and hunting on the lonely plains, Indian camps, mountain climbing, trapping and canoeing are described. There is not a dull page, and the author manages to put much of the spirit of the West into his books. Jack is a real boy, and the books are stories for live boys—not lectures in disguise.

$1.25 per volume, postpaid. $7.50 per set

Hunting in Many Lands.

Contents: Hunting in East Africa, W. A. Chanler. To the Gulf of Cortez, George H. Gould. A Canadian Moose Hunt, Madison Grant. A Hunting Trip in India, Elliott Roosevelt. Dog Sledging in the North, D. M. Barringer. Wolf Hunting in Russia, Henry T. Allen. A Bear Hunt in the Sierras, Alden Sampson. The Ascent of Chief Mountain, Henry L. Stimson. The Cougar, Casper W. Whitney. Big Game of Mongolia and Tibet, W. W. Rockhill. Hunting in the Cattle Country, Theodore Roosevelt. Wolf Coursing, Roger D. Williams. Game Laws, Charles E. Whitehead. Protection of the Yellowstone National Park, George S. Anderson. The Yellowstone National Park Protection Act. Head Measurements of the Trophies at the Madison Square Garden Sportsmen's Exposition. National Park Protective Act. Price $2.50.

Modern Sporting Gunnery.

Written by the well-known English gun expert Mr. Henry Sharp, and contains 525 pages and many illustrations. It tells of the various makes of guns and rifles, beginning with the early days of the art up to the present time. It deals with the subject of mechanism, boring, effect of different loads, and gives the results of scientific experiments. It tells "why" in entertaining and easily understood language, and is a book every lover of gun or rifle should have in his library. Cloth bound. Postpaid, $1.70.

Hunting Without a Gun.

And other papers. By Rowland E. Robinson. With illustrations from drawings by Rachael Robinson. This is a collection of papers on different themes contributed to FOREST AND STREAM and other publications, and now for the first time brought together. Price, $2.00.

My Friend the Partridge.

S. T. Hammond. An inimitable study of the noblest of our game birds, following the ruffed grouse deep into his haunts, detailing the experiences of more than 60 years in the field, and throwing much light on the habits, life history and habitat of the game. A most delightful reminder of happy days with upland game. Cloth, 150 pages. Postpaid, $1.00.

Inter-Ocean Hunting Tales.

Edgar F. Randolph. A collection of stories such as are told about the camp-fire. Mr. Randolph offers a hunting experience bounded only by the two oceans, replete with incident, interesting from its novel viewpoint and dealing with every kind of game that falls to the rifle of the American sportsman. Cloth, 200 pages. Postpaid, $1.00.

Camp Life in the Woods.

And the Tricks of Trapping and Trap Making. W. Hamilton Gibson. Containing hints on camp shelter and bait receipts of the trapper, the use of the traps, with instructions for the capture of all fur-bearing animals. Illustrated. Cloth, 360 pages. Price, $1.00.

Jack, the Young Ranchman;

Or a Boy's Adventures in the Rockies. By George Bird Grinnell. Illustrated. Cloth, 304 pages. Price, $1.25.

Jack Among the Indians;

Or a Boy's Summer on the Buffalo Plains. By George Bird Grinnell. Illustrated. Cloth, 301 pages. Price, $1.25.

Jack in the Rockies;

Or a Boy's Adventure With a Pack Train. By George Bird Grinnell. Illustrated. Cloth, 272 pages. Price, $1.25.

Jack the Young Canoeman.

George Bird Grinnell. Illustrated. Cloth, 286 pages. Price, $1.25.

Jack the Young Trapper.

George Bird Grinnell. Illustrated. 278 pages. Price, $1.25.

Manual of Taxidermy for Amateurs.

C. J. Maynard. A complete guide in collecting and preserving birds and animals. Illustrated. New edition. Price, $1.00.

My Sixty Years on the Plains, Trapping, Trading and Indian Fighting.

W. T. (Bill) Hamilton. The author was the last survivor of the old race of free trappers. Bill Hamilton was born in 1825, and was on the plains in 1842, trapper, Indian fighter, sign talker, trader, scout and guide so long as the old West survived. This book is the simple unaffected story of his adventurous life, more thrilling and full of personal interest than any romance. Cloth. Illustrated, 223 pages. Postpaid, $1.50.

Nursing vs. Dosing.

S. T. Hammond. A most practical book for the dog fancier, based largely on Mr. Hammond's observation that dogs, and particularly house dogs, suffer from too much medicine. Contents—Nursing, Cleanliness, Diet, Other Foods, Kennel and Exercise, Common Ailments, Diarrhea, Convulsions, Epilepsy, Distemper, Eczema, Need of Proper Care, Stomach, Vermin, Ear, Mange, Nervous System, Colic, Worms. Cloth. Illustrated, 161 pages. Postpaid, $1.00.

Rhymes of the Stream and Forest.

Frank Merton Buckland. A charming collection of verse by an author who knows and loves nature well. A particularly pleasing gift for fishermen, closely simulating in form and ornamentation the standard fly-book. Cloth. Heavy laid paper. Sumptuously bound. Postpaid, $1.25.

The Still-Hunter.

Theo. S. Van Dyke. A Practical Treatise on Deer-Stalking. Extra cloth, beveled, 390 pages. Price, $1.75.

Log Cabins and Cottages.

William S. Wicks. This book covers building for the woods from the simplest shelter to the most elaborate cottage, cabin or house, and their furnishing and fitting. The details and directions are at once simple and comprehensive, and the illustrations are numerous and illuminative. Cloth. Illustrated, 44 full page plates and numerous text illustrations. Postpaid, $1.50.

The Angler's Workshop. Rod Making for Beginners.

Perry D. Frazer. A complete, simple and thoroughly up-to-date work for the guidance of the amateur rod maker, carrying him from first principles through all phases of successful rod making. There is no theorizing or speculation. All terms are simple, and all kinds of rods and woods are treated of. Cloth, 180 pages. Four full-page illustrations, 60 working drawings. Postpaid, $1.

The Book of the Black Bass.

James A. Henshall. The standard work on the black bass, comprising a complete scientific and life history of the black bass, together with a practical treatise on angling and fly-fishing, a full description of tackle and implements, and general observations. Cloth. Illustrated, 470 pages. Postpaid, $3.00.

Men I Have Fished With.

Fred Mather. Sketches of character and incident with rod and gun from childhood to manhood; from the killing of little fishes and birds to a buffalo hunt. Illustrated. Price $2.00.

My Angling Friends.

Fred Mather. A Second Series of "Men I Have Fished With." Cloth, 369 pages, with 13 illustrations. Price, $2.

Training vs. Breaking.

Practical Dog Training; or, Training vs. Breaking. By S. T. Hammond. To which is added a chapter on training pet dogs, by an amateur. Cloth, 165 pages. Price, $1.00.

How to Build a Skipjack.

Complete plans and instructions for building a light draft sloop. Plans and directions easily followed. Cloth. Illustrated. Postpaid, $1.00.

How to Build a Knockabout.

A wholesome boat for all-around cruising and racing; 32ft. O. W., 10ft. beam, 26 in. draft. Full working plans and drawings, with instructions for building. Cloth. Illustrated. Postpaid, $1.00.

Life and Sport in Labrador

NAPOLEON A. COMEAU.

In "Life and Sport on the North Shore of the Lower St. Lawrence and Gulf," Mr. Comeau has made a valuable addition to the literature of rod and rifle—and more. It is a book of engrossing personal interest to the sportsman or general reader, and of rare value to the student of wild life.

The author describes the events and experiences of fifty years, spent in the cause of humanity and science in one of the most interesting and least known sections of Canada. He writes as one sportsman to his fellows, detailing his experiences with the wild things of wood, shore and sea, with plenty of stirring experiences with big game and gamy fish.

Illustrated, 450 pages. Paper. Postpaid, $2.50.

FOREST AND STREAM PUBLISHING CO.

ODDLY NAMED BEAST.

THE first snow which fell this fall in the Moose River country was written upon by a fisher or Pennant's marten, called Old Squaw Lake by the trappers in that part of the Adirondacks. This particular fisher gets its name from one of the localities where it travels and it is one of the few Adirondack wild animals which has a name of its own.

Fishers range in size from twelve to forty pounds. They are members of the weasel family and rank next to the wolverine in size. They are, weight for weight, the strongest and fiercest kind of animal in the Adirondacks and some of them are more cunning than foxes, although their intelligence or instinct is usually no keener than that of a mink or marten. They are fairly plenty in spite of the fact that an ordinary pelt is worth $6.00 or $8.00, while as high as $15.00 to $20.00 is paid for a large, prime black skin. Old Squaw Lake, trappers reckon, must be worth at least $25.00 and perhaps more.

Old Squaw Lake, says the Sun, is very seldom reported in the summer months. About three years ago, however, two campers were going along the alder bed opposite Balsam Lake on Indian River when they were startled by seeing a large black animal dash out of the alders and run up the valley toward the mountain. The first thought was that it was a small bear, but a moment later when they had a clear view they saw that it was a monster weasel of some kind. The two had perhaps the best sight of Old Squaw Lake that any one ever had, and they agreed that the animal's pelt was almost but not quite clear black. There was a tinge of brown along its back and its nose was a dirty gray.

Down in the alders the two found where the fisher had been catching frogs. On a bit of sandbar they found a frog torn to shreds and half eaten. Along the bank was a distinct trail showing where the fisher had tramped back and forth through the grass and weeds searching for frogs and possibly for fish and mud turtles.

A perceptible limp besides its size identified Old Squaw Lake. One foreleg was caught in a trap some years ago and the animal chewed its leg off and broke the bones just above its wrist to get out of one of French Louie's fox traps. The paw was as large as that of a good sized coon. The missing paw has enabled trappers to identify the animal certainly in the snow. Some have followed the tracks just to see what "the old cuss is up to," while others have followed determined to add the fur to their winter's catch. The story seekers have been more successful.

The Squaw Lake country reaches from Moose River to the West Canada lakes. The big fisher seems to make that land its home. In winter, trappers say, it follows a line around and around, going from ten to twenty miles a day, depending on the loose snow, and taking ten or fifteen days to make the circuit. Two or three trap lines cut across the circuit, but the fisher knows them all. Sometimes just to show what it thinks of trappers it tears a trap cubby to pieces and eats the bait. Again, finding a marten or a mink in a trap, Old Squaw Lake eats it and thus exasperates the trapper to the extent of $10.00 or $20.00. Whatever the real value of the fur destroyed, the trapper firmly believes it was a ten-dollar mink or a twenty-dollar marten.

Old Squaw Lake enjoys hunting rabbits, judging by its trail. In winter the rabbits live in balsam swamps, and Old Squaw Lake has a number of such swamps along its runway. A mile or two along the trail in a balsam swamp indicates the most approved of time and method of hunting rabbits. When the new fallen snow lies a foot deep, loose and fluffy, in the woods Old Squaw Lake travels through the swamps with unusual care. Running is out of question, and fishers hate to walk. Long acquaintance with Old Squaw Lake's track makes it easy to tell when it is in a swearing mood. The animal tries to run, and at every jump lands ear-deep in the loose snow. In half a hundred jumps the animal is breathless and angry. It whips the snow to right and left with its stump and paw and shakes the icicles from its whiskers and porcupine quills. Then it walks till its breath is back, when it runs again.

But in spite of anger and hurry the old fisher hunts right along. It crawls under brush heaps, it seeks hard pan under the thick balsam cap top canopy, and at last sneaking noiselessly it plunges suddenly around a bush or hummock of snow or tree trunk and seizes a rabbit squatted in the snow. Then the fisher takes its revenge on the bawling rabbit, shaking it and tearing it to pieces.

The porcupine quills in the whiskers of Old Squaw Lake are a matter of inference. French Louis says Old Squaw Lake's principal diet is porcupines. All fishers kill some porcupines, and no trapper remembers catching a fisher that did not have porcupine quills in its forelegs, among its whiskers and in its chest. Places where Old Squaw has killed a porcupine may be found along its trail by following the trail a day or two or less. There are three or four mountains along the runway on which porcupine dens are found in the broken cliffs and stone.

Old Squaw Lake climbs trees and fights the porcupines in topmost branches. Still fighting the two animals come crashing to the ground, and when the porcupine yields the least bit the fisher's nose plunges to the unprotected belly. Then at its leisure the nsher eats its fill. After such a gorge the animal retreats to the rocks and sleeps a while.

HOLD UP.

"ALL the wise men in this world are not in the cities by any means," said Otto Hornich in the Newark Star. "Why, I heard of a farm up in Sussex county that had not been hunted over in three years, and several of my friends and myself went up there two weeks before the season opened, and a short walk over the farm convinced us that it would be a good place to hunt when the season opened. On our way to the depot we met the farmer that owned the farm and paid him $10 for the hunting privilege, and at his request we went back to the farm, and he put up over thirty rabbits, two partridge and several quail just to show us that we had a bargain in the hunting line.

"The morning that the rabbit season opened we were on hand before daylight, and believe me when I say that five of us hunted that farm even to the extent of pulling some of the stones from the fence, and all we got was one rabbit. About noon we went to the farmhouse to see the farmer, and his wife said that her husband had taken the $10 we gave him and went hunting over to Johnsonburg. We asked her what had become of the game, and she said that they must have holed up, and that was all the satisfaction we had for our trouble and our money."

TWO DEER AT ONE SHOT.

IN the recent deer hunting season in Michigan at least three Upper Peninsula men were successful in filling their licenses as the result of a single shot. Sheriff Turnbull, of Luce county, was one of these. Two deer were standing together. The sheriff fired at one, the ball passing through its body and killing the other animal also.

Paul Laabs, Sagola, Dickinson county, found two bucks engaged in a battle. A shot from Laab's rifle killed the spikehorn and the other was so weak from the loss of blood that it expired as soon as released.

Prof. Hill, superintendent of schools at Crystal Falls, is the third man who bagged two deer with one shot. One of his trophies was a dead deer, however. The animal had been engaged in a battle, during which their antlers had become interlocked, and one of the combatants was dead. Prof. Hill shot the living animal.—St. Louis Globe-Democrat.

THOSE STRIPES.

"Now, children, what is this?" asked the teacher, holding up the picture of a zebra. "It looks to me like a horse in a bathing suit," answered a little boy.—Our Dumb Animals.

BIG GAME IN AFRICA

On the East Coast,

Where the Lion and the Leopard are at Home and the Elephant, the Hippopotamus, the Rhinoceros, the Tiger.

The Palatial Steamers of the

Union-Castle Line

Enable the Tourist to

Circumnavigate Africa

in Either Direction

Via West Coast — weekly sailings of Royal Mail Steamers from Southampton for Madeira, Cape Town, Port Elizabeth, East London, Natal. Intermediate ships leave London and Southampton weekly for Cape Town, Port Elizabeth, East London, calling fortnightly at Teneriffe, Las Palmas and Mossel Bay, and monthly at Ascension and St. Helena. Fortnightly service to Delagoa Bay (Lourenco Marques), and monthly to Beira and Mauritius.

Via East Coast — Sailings from London and Southampton every four weeks, via Suez Canal, calling at Marseilles, Naples, Port Said, Port Sudan, Aden, Mombasa, Zanzibar, Mozambique, Chinde, Beira, Delagoa Bay (Lourenco Marques) and Durban.

THE DELIGHTS OF AN AFRICAN TOUR are hundred-fold. The Victoria Falls, that greatest of all cataracts, with a sheer drop of 420 feet, may be reached by either West Coast or East Coast service by rail from Cape Town, Port Elizabeth, East London, Natal or Beira.

The Biblical Ruins of Sheba—supposed to be the ruins of Solomon's temple, are only a few miles from Victoria.

Intending Tourists and Hunters are invited to address, for full information, literature, and through bookings

The Angler's Workshop

RODMAKING FOR BEGINNERS

By PERRY D. FRAZER

A unique work, bringing the science of rodmaking up to the very moment and epitomizing the knowledge and the experience of experts for the guidance of the average man. The evolution of bait-casting principles has made Mr. Frazer's book supersede all previous publications on the subject.

Every angler—young or old—who is fond of adapting his rods and tackle to his own ideas of what they should be, will find in this book a large fund of information gathered by the author in years of study, experiment and practical experience in fishing, tournament casting and at the work bench. He theorizes and speculates not at all. He tells "the how" of everything connected with rodmaking in a way that makes results certain. All explanations are simple and easily followed.

Separate chapters are devoted to each of a half dozen types of bait-casting rods; to tarpon, surf and light salt water rods; bass and trout, salmon and tournament fly-rods. Complete specifications of well known types are given, and the chapter on split bamboo rodmaking is the most comprehensive treatise on the subject ever published. Indispensable in the angler's library.

Cloth, 180 pages, four full-page illustrations, 60 working drawings, making plain every feature of the text. Postpaid, $1.

The Game Book

STANDARD BIG GAME MEASUREMENTS

Every man wants to compare his trophy with those of other big-game hunters. But comparisons are useless unless there is a fixed standard.

The game book of the Boone and Crockett Club, the foremost organization of hunters of American big-game supplies this. Compiled by J. H. Kidder, it provides directions for standard measurements of the large game animals of America, with spaces carefully arranged for complete data regarding the kill, locality, time, conditions, etc.

It is handsomely and durably bound pocket size. It is an invaluable record for every man who goes into the wild for sport with the rifle, a handy book, a camp companion, and a library reminder of days afield. Leather.

Postpaid, $1.50

ENDOWMENT FUND FOR N. Y. Z. S.

SINCE its organization, the New York Zoological Society has been in the rather extraordinary position of having the charge of great institutions, without possessing any income-producing property whatever. The law authorized it to collect and care for wild animals, and assigned a piece of waste land for its uses. That the society has secured its splendid collections and has housed them in elaborate and beautiful quarters in the Zoological Park, is due chiefly to the generosity of members of the society. A year ago the executive committee determined to raise an endowment fund of $250,000, and this task has just been accomplished. The society and New York city are greatly to be congratulated on the achievement.

Wisely managed, great funds, such as the Carnegie and Rockefeller foundations, cannot fail to be of enormous service to humanity. A fund like one of these in the hands of the men who in ten years have created the Zoological Park and the Aquarium could be made the means of a vast amount of work, far-reaching in results and of the highest economic value, in the conservation of native animals and birds and the protection of our streams from pollution.

It may be conceived that the executive committee will not be satisfied with the endowment fund already raised. Of the public and semi-philanthropic institutions of New York city, like the American Museum of Natural History, the Metropolitan Museum of Art, and other institutions more distinctly benevolent, many possess large endowments, received by gift or bequest; and the Zoological Society, which performs so useful a work and whose collections last year interested and instructed five and one-half millions of people, is likely, as its educational value becomes better understood, to receive further gifts and large bequests from wealthy persons in New York city. The endowment fund just established ought to be made ten times larger.

The credit for raising this fund belongs largely to Madison Grant, the secretary of the society. Since its establishment, Mr. Grant, who was one of the founders, has put into his work in behalf of the institution, the best that was in him. His labors have been untiring and markedly successful, and the Zoological Society and the city of which he is native owe him a large debt of gratitude.

FEED THE GAME BIRDS.

THERE is now no doubt that the severe storms of last month were detrimental to the quail. Low temperatures, snow, rain and sleet were frequent throughout the month, and on at least two occasions the mercury fell from twenty to forty degrees in a few hours' time. Judged by the average for a score of years, the month was unusually cold and stormy, and small game was taken at a disadvantage. This was especially the case in nearby States where the long drouth of summer and autumn affected all vegetation and reduced the food supply of the birds. In this region the rainfall of the month proved to be of little benefit to the people, for the ground was frozen and the water, therefore, ran off instead of being absorbed and held against this year's needs.

The time is ripe to look after the welfare of the birds and small game. Every man who shoots will be well repaid in time if he will scatter a little grain where it will be found by the birds. This may best be done after a storm of snow or sleet. Though the winter may or may not be a severe one from now on, it will be a long one, and with the lack of old-time covers the game will need all the attention it may receive.

In this connection it is gratifying to note how widespread is the desire to feed game birds. Farmers are doing commendable work, and sportsmen's clubs detail members to scatter food after every severe storm. In many places local papers print frequent reminders that the game needs feeding, and mention the names of those who are doing their part, thus establishing friendly rivalries among communities, all of which is praiseworthy.

GOVERNOR DIX'S RECOMMENDATIONS.

GOVERNOR DIX'S first annual message to the New York Legislature contained a surprise for those who have followed closely the interests of the game, fish and forest conservationists. There were rumors that the Governor would probably recommend that a division be made in the Forest, Fish and Game Commission, one department to take charge of forestry, and the other to protect game and fish, each under a deputy commissioner, with a commissioner over both.

Instead, Governor Dix recommends that the Forest, Fish and Game Commission and the Water Supply Commission be consolidated. He believes that to one commission should be entrusted the "very important question of the conservation and proper development of the natural resources of the State." He states it as his belief that the conservation of the forests and the saving of the stream flow are matters that are related in one form or another to each other, and that, therefore, they should be placed under one jurisdiction, in order to secure efficiency and economy. He further favors the establishment of manufacturing plants along our system of waterways, but throws no light on the important question of just how these changes should in his opinion be brought about.

While the Governor favors reforestation of denuded and waste lands, and the establishing within the forest preserve of tree nurseries, he is opposed to the purchase abroad of seedlings to be used in this work.

Thomas M. Osborne, of Auburn, formerly a public service commissioner, has been appointed Forest, Fish and Game Commissioner to succeed H. LeRoy Austin who, on the resignation of James S. Whipple, consented to fill the position during Governor White's term. Governor Dix, it is asserted, favors a single-headed commission for the department, with the water supply interests as a bureau only within this commission. At present there are five water supply commissioners.

FROM the West comes a strange tale of hardship, possible riches and impending death in Alaska. As a sort of postscript, there is the implied defense, "If you don't believe it, ask the man who killed the goose." It is said that Fred Mordaunt, of Webb, Neb., shot a wild goose which was unlike other wild geese that follow the Missouri and Mississippi southward in December, in that it bore a message from a prospector in Alaska. This was attached to the goose's leg or neck by a bit of wire. It is said the message bore date of June 15 last, and was signed by George Powers of Memphis, who wrote that he had broken his right arm after finding a rich vein of gold on Pine Creek north of White Horse Pass, Alaska; that he could not walk and was unable to cook the little food he had in his cabin. That it is possible to catch a wild goose while it is moulting is known. To write a letter and attach it to a goose, using the left hand only, might well be more difficult for some persons.

THAT there are optimists in Madison county, New York, is evident. The Bird and Anglers' Association of that county, in its annual report, says its efforts have been productive of such satisfactory results that it anticipates that it will be able to restock the waters of the county with fish and the covers with game birds. Netting in the east end of Oneida Lake has, through the vigilance of sportsmen, become a precarious calling.

THE SPORTSMAN TOURIST

Baltimore to Bangor and Back

A Leisurely Cruise on a Small Yacht from the Chesapeake Northeastward

By E. P. MORRIS

(*Concluded from page* 10.)

AT Sandy Hook we lay over two nights, sleeping, eating and resting. The heavy cloud of smoke continued till the second evening, when it was lifted by a westerly wind, and we were able to look up at the Navesink Highlands and the splendid wheeling light. But the impression that remains on my mind is dun-colored. This may have been partly subjective, for I felt a considerable dislike to going through New York Harbor under sail. But on the morning of the glorious Fourth, there was a fine W. S. W. wind, and the prospect, both within and without, was more cheerful. By the time we reached the Narrows, the air was clearer, and at Quarantine there was a brilliant scene, a dozen big steamers waiting to go in, decorated with flags in honor of the day and crowded with excited passengers. The sail up to the Battery, too, was extremely interesting and the buildings of the lower city had never before seemed so impressive. But by the time we turned into the East River, the wind had gone around, first to the northwest and finally to northeast dead ahead, light at times, so that we could scarcely stem the tide under the bridges, then increasing and puffy, till we were occasionally sailing rail under.

BUCKSPORT LOOKING SOUTHWARD.

With room enough this would have been nothing. Even in a narrow channel, like that by Blackwell's Island, it would have been a bother only if we had had the place to ourselves. But the day was the Fourth and every excursion steamer was out, nor was the ordinary traffic greatly diminished, as I had hoped it might be by the holiday. As my sailing has almost always been in a small boat, it has been my habit to keep out of the way of steamers, without standing much upon my rights. But the skipper has been trained in another school. He not only knows his rights, but also "knowing, dares maintain."

No other sailing craft was so insane as to be beating through the East River that day, and we had, therefore, the right of way over everything. It was an inspiring and instructive sight to see the skipper holding his course. "That ferryboat is just coming out," said I. "We're big enough for him to see us, I guess," said the skipper, and did not turn his head to look. He might have been a second Hendrik Hudson, exploring a river in a wilderness. And it was equally instructive to note the behavior of the steamers. The ferryboat backed into her slip to let us pass, and a tug with an unwieldy carfloat swung out of our way. Nor did the captain of the tug, as experience in the past would have led to expect, lean from his pilot house to curse us. Nor, by this time, so great was the effect of the skipper's coolness, should I have cared if he had. Indeed, I ought not to be speaking thus of tugboat captains, for it was one of that much tried, and I am sure much maligned class who, as we were making short tacks past Blackwell's Island, shouted out to us that there was plenty of water and we could run right up to the shore anywhere. And we were soon to need all the water there was, for a tug with two barges was going up just ahead of us, and we could not get room to beat past on either side. Our right of way was gone and we had to sail with jibs aback to keep astern of the barges, making nice calculation of their rate of speed.

While we were thus busy, an excursion steamer came up astern to pass us and a steam yacht selected this particular juncture to come down on the other side of the barges, cutting us off from a tack in that direction. It was a crowded moment, and the skipper, who had never been through the East River before, said: "How much more is there of this?" It was the only indication he gave that he was not enjoying himself. As for me, I was not yet enough at home with a wheel to trust myself to relieve him, but I tended jib sheets with such earnestness that I wore my trousers through at the knees.

UNDER WAY.

And how did all these excitements, nautical and sartorial, work out? As such things usually do, we anchored at five in Manhasset Bay, got supplies and fresh drinking water, had a dinner of unusual splendor, celebrated the day with

fireworks and then sat late on deck, enjoying the peace of an especially beautiful evening. It is in such quick contrasts that one of the pleasures of cruising is to be found.

From this point our cruise had the charm of familiarity, or renewed acquaintance with places already known rather than the excitement of novelty. The log of a cruise in waters so well known would be tedious. To summarize briefly, we spent a few days in the Sound, sailed to Boston to pick up our very youthful granddaughter with her attendant father and mother, loitered for a month or more on the Maine coast, chiefly in Penobscot Bay and about Mount Desert, spent a week of unfavorable weather running offshore to look for swordfish—saw one and got none—and then turned south again, dropping grandmothers and mothers and babies and sons and sons-in-law at various points as the demands of home duties were felt. I finally anchored in Morris Cove, a sole survivor, at 6 P. M., Tuesday, Sept. 13, completing a cruise of a little more than 1,600 miles.

On the Maine coast above Portland we were in search of the comfortable and the picturesque; that is, of harbors where we could lie in quiet and could find new beauties of scenery, and yachtsmen who cruise in that region may be interested in a few notes. In Casco Bay, if you go into Pott's Harbor, the northern side is a much prettier anchorage than the southern side near the steamboat landing. Harpswell, opposite Orr's Island, is, I suppose, known to everybody, as it deserves to be, but Cundy's Harbor is quite as pretty in a different way. Anchor in the cove on the southern side, just round the point. At Pemaquid do not go into New Harbor, but up John's Bay, around John's Island, past the steamboat wharf; then turn to the northward into the little basin, and if you did not know the place before, be grateful for this information.

In Penobscot Bay go by all means into Gilkie's Harbor, the upper end near the light, not the lower harbor near the millionaires. Choose for this a night when the wind shall drop to a dead calm and when there shall be a full moon. Then, as you hear the cry of herons and the barking of seals, you will be learning in its perfection the charm of this region. (But on your way up stop at Rockland and buy ten yards of mosquito netting, double width.)

Do not fail to go up the river to Bucksport. This is one of the prettiest little towns on the whole coast, with fine trees and old houses in well-kept yards and shaded streets and a waterfront like a Whistler etching. But let no persuasions—no, not of twelve wives and twenty-four daughters, induce you to go up the river to Bangor. Twice I have yielded and twice the ebb tide has left me aground. There are uncharted shoals in that river, shoals composed of sawdust and water-logged slabs, and to go aground on such ledges is a peculiar ignominy. Therefore, let Bucksport be your limit. It would have answered just as well as Bangor for my alliterative title. I must admit that there is a very beautiful cove a little above Bucksport, below Wintersport, with a fine view up into the mountains. But here again I came within an ace of getting aground.

At Castine the anchorage above the wharves, where the local boats lie, is out of the tide, and the shore is infinitely prettier than the summer cottages below.

Up the Bagaduce River, about two miles above Castine, there is a very nice anchorage in a curve of the hills. We thought Pretty March Harbor, in Blue Hill Bay, a fine specimen of the Maine cove, and we were greatly interested in the process of bailing herring out of the fish weirs that line one side of the harbor. (The local pronunciation of this, as if *ware,* is not a corruption, but a perfectly correct survival of the early pronunciation, as the spelling *wear* shows.) Blue Hill itself is also pretty in a more sociable way, and the anchorage proved better than I had expected from the chart, but the entrance is a little difficult. Perhaps my nerves were not quite steady, for an hour before we came to Blue Hill I had barely escaped running on a sunken rock. The skipper's keen eye and the vessel's quickness were all that saved us. That kind of thing gives me a distaste for the look of rocks under water, and I thought it the part of prudence to have the skipper at the bowsprit end, both as we went in and again when we were beating out the next morning.

Buck's Harbor is known, I suppose, to all Maine cruisers. It is beautiful in itself, and the view from the anchorage out toward Pumpkin Island Light is especially well composed. We lay over a Sunday here and walked to the heights above the village to get the fine outlook over the bay.

Coming down to the southward, Muscongus Bay has a number of good anchorages, especially Friendship, which is the skipper's home, and which we look upon as our own home port in Maine. The harbor is fine, the view from the hill is very pretty, excellent supplies and water can be had on the wharf and it was here that our engine was finally and successfully tinkered. The passage out toward the eastward behind Morse's Island is particularly beautiful, though it requires a little care for a stranger. There are also some charming spots in the Georges River, especially Turkey Cove.

The passage through Davis Strait among the Georges Islands is very frequently used by cruisers along shore. When next you go that way turn out to the southward and spend a night in the little harbor between Allen's Island and Benner's, anchoring among the lobster boats and perhaps carrying a line out to shore, since the cove is narrow. The anchorage would perhaps be a little uneasy in a northeaster, but the place is so perfect an example of a small fishing community and so untouched by external influences that it well repays the slight risk.

To conclude this guide book to the picturesque with a spot nearer home, I fancy that not many cruisers use the little cove at the head of West Harbor in Fisher's Island. It is both pretty and comfortable, giving a better shelter, even from a northeaster than the chart would lead one to expect, and it has been to me a welcome relief from the monotony of going into New London. Go inside of the Dumpling and follow the buoys around as far as the lead gives you water enough. Boats of four feet draft can anchor inside the little island. The passage on the southern side is the better one. If you lie over here, the view from the high point of Fisher's Island is superb, not surpassed in the Penobscot.

On a cruise there is one subject of observation and remark of which we never tire. We

PORTLAND HARBOR.

A STRANGER FROM THE LAKES.

are forever looking at boats and passing judgment upon this or that product of the designer's skill, as if we carried within ourselves a perfect standard of taste. Yet it is as true of boats as of houses that the variety is infinite. We saw in the course of the summer almost every kind of thing that floats, boats beautiful, boats ugly, boats new or old, graceful or able-looking, in the fashion of the day or forty years behind it. There is a certain comfort in the very fact of such variety, for no man need fear to be conspicuous by reason of the old-fashioned look of his craft. Some time he will surely find himself anchoring alongside a vessel of an older vintage than his own. And a yacht must be a very great beauty if in some harbor she does not have to confess herself outshone. Yet underneath all this variety of tastes there exist such things as permanent standards. In one harbor, where some 200 yachts were at anchor, I spent a forenoon in running about and looking them over, and a very pretty and instructive sight they were. Of them all the one to which I returned with most lasting and complete satisfaction was an old boat in short cruising rig, topmast down, paint dingy, mast weathered, varnish worn off. But her lines! The perfect sweep of her sheer! The admirable proportions of her overhangs! The very absence of all the usual accessories of finish and polish only brought out more clearly the truth that beauty is a matter of proportion and line, not of ornamentation. And when I ran under her stern a second time and read her name, now painted out, and remembered who her designer was, I was pleased with my discernment. For she has been a famous beauty and will be a beauty till she is pulled to pieces.

Encouraged by this recollection of my own perspicacity I will venture to express my weariness of the monotonous uniformity of the yachts that have been turned out during the last half dozen years. At its best the type is very good, but it is so rarely at its best. The formula and pattern for turning out a boat that shall be in the fashion is now an open secret, and the builders are repeating themselves and each other with unintelligent facility. But there are signs that this fashion is nearing its end, and that designers are again to be allowed to show originality and individuality.

Having allowed myself this little fling at men who know much more about the subject than I shall ever know, I dare not say a word about the "raised deck cruiser," but the most dignified and satisfying vessel that I saw under power —with the exception, perhaps, of some steam yachts—was a common tugboat. The man who shaped her had an artist's eye. And the very ugliest vessels that I saw in the whole summer under sail or power were the vessels of which you and I are part owners, the vessels of the United States Government. There was a revenue cutter in Rockland Harbor when I was there. She lay out toward the breakwater where all her shape could be seen, and near her lay two steam yachts of about her size to point the contrast. Fellow citizens, it was a contrast to make us weep. Bow, stern, sheer, placing of deck house, rake of masts, size and rake of smokestack—as one examined her, feature by feature, and compared her with the yachts, it was plain beyond question that every single thing about her was wrong. Everything was wrong; nothing was right. And she is not alone. She is typical of what is to be seen wherever you meet a Government vessel. They are all alike—tenders, launches, even tugs, conspicuous among vessels of their kind for shapelessness and lack of right proportion. To what combination of causes this state of things is due I am unable to conjecture, unless the lines are drawn with red tape instead of battens.

Another subject of daily interest to us on this cruise was, of course, the weather. I do not know what the accurate records of the Weather Bureau would say, but to us it seemed to be a summer of exceptional friendliness. The log shows that we lay over twenty-eight days out of eighty-nine. Of these about half were from choice, for pleasure or rest. Four or five were days of heavy weather; fog was responsible for four only; slighter causes accounted for the rest. The longest delay was at South Boston, where we spent four days of calm and rain and fog. This was on the way home, when only two of the party were left. We were by that time rather anxious to push on and the delay was vexatious. But there was this comfort about it, that the calm and fog left no room for indecision. The weather was plainly unfit for a start. At Provincetown on the contrary, where we were detained almost as long, only one day was unmistakably bad, and we were, therefore, in a constant state of watchfulness and uncertainty, ready to start at any hour of the day or night if the weather should be favorable; in fact, we made two starts and turned back, once because the wind dropped, once because we ran into a sea so heavy that we put the whole pulpit under, pole and all. At the time when this happened the skipper was at the wheel and my daughter and I were in the galley hanging on and trying to get some breakfast. Neither of us has ever known seasickness, but the motion was extremely violent, aand we were both dizzy, and one at least was pea green. We gathered up what food we could carry and staggered aft, and learning from the skipper when we inquired what mountain range we had been crossing, that he had been letting the vessel take it easy, I thought it time to turn back before we got into really rough water. A heavy northeaster all day justified the decision. We had our reward, too, the next morning, for we were able to make our third start in a clear and moderate northerly, and though the breeze kept heading us as far as Highland Light, giving us a slow beat to that point, yet when our sheets were once started we had thirty hours of the most delightful sailing of the whole summer. We passed Pollock Rip before sunset and the Handkerchief Lightship before dark, and then took the well-lighted course up Vineyard Sound. There was a fresh young moon till eleven, the sky was clear and starlit, and the air was not very cold. I am aware that the skipper, who wore only two coats and his suit of oilers, would not endorse this statement, but I had on a thin jersey, a thick sweater, a winter coat and a heavy overcoat, and I pronounced it a fairly comfortable night. We went through Quick's Hole with a strong tide at daybreak, and after a few hours of light and shifting wind at mid-day, we slipped into Stonington in time for a comfortable dinner, having made nearly 150 miles in thirty-six hours of easy and delightful sailing. I think we were agreed that this pleasant run was compensation for the delays of starting, as it was a vindication of the practice of waiting for a "chance" and then using it to the utmost.

I do not often sail by night, but as the skipper smilingly remarked, when I was talking it over with him at Old Point Comfort, "We can't go from here to Maine without staying outdoors over night." We sailed at night when we had to, or when we were in a great hurry. I happened to read in one of the few newspapers I saw during the summer the account of a collision between a yacht and a tug off Point Judith in which the yacht was sunk, and the men who were asleep in the cabin escaped with difficulty by swimming. Naturally I thought of my family, not all of them swimmers, and of what would have happened to them in such a case. But without allowing myself to prejudge the matter on the strength of a brief report in a newspaper, I venture to think that we shall never be in such a case. There were always two of us on deck. The man on lookout was often forward; the side lights were frequently inspected and were especially examined whenever we were nearing another vessel. I am confident that nothing under sail or steam got within a mile of us without our having already seen it and carefully determined its course with reference to our own.

I do not mean to say that there are no special risks in night sailing; indeed, I should have to admit that we ran past the bell buoy off Wood End, going into Provincetown about 10 o'clock without either seeing or hearing it until our wave set it ringing. But at least we took great pains, not nervously, but steadily, to diminish the risks.

That, I believe, is the reason why I have no adventures to relate. The nearest approach to an adventure was my shaving too close to a rock in Blue Hill Bay. If I had run on that it would have been uncomfortable or worse, and the fault would have been mine. I had not laid a course, but had trusted to a general impression that I was far enough off to escape the ledges which I knew were somewhere near. That was poor seamanship, and I am inclined to think that most disasters in summer weather are due to the same cause. They are not adventures, jolly or otherwise, but simply evidence that the man in command was for the time a poor sailor who did not know how to play the game. For the essence of the game is that one voluntarily puts himself and perhaps his family into circumstances where safety depends upon an unusual degree of watchfulness and an unusual kind of will. One should not enter the game and then refuse to play it, trusting to chance. But we all know that eternal vigilance is a little hard to keep up on a pleasant summer afternoon.

A few statistics for a close. I was on the boat 102 days, not sleeping ashore during that time and taking only four or five meals ashore. We were in commission and cruising eighty-nine days, sixty-one under way some part of the day, twenty-eight at anchor. We were under way five nights, beside some evening runs, one of which lasted till 2 o'clock in the morning. The shortest run was seven miles in eight hours of drifting; the longest were 145 and 146 miles. The total distance, not counting beating, was 1,600 miles. We anchored in fifty-two different harbors, some of them several times. The longest time in one harbor was four days.

NATURAL HISTORY

Maryland Academy of Sciences.

BALTIMORE, Md., Jan. 6.—*Editor Forest and Stream:* With this I am sending you a couple of photographs, one of the American widgeon (*Mareca americana*); the other of the European widgeon (*Mareca penelope*).

The European widgeon is a specimen killed Nov. 12, 1910, at Carroll's Island, Md., by J. O. Norris, of Baltimore, who in his note of gift states that he has known of but two being killed on the island in forty years.

"The American Waterfowl Family," by Leonard C. Sanford and others, speaking of the European widgeon, says: "This bird is a rare straggler to the United States, the most noteworthy instances of its occurence being on Long Island, December, 1884, at Alexandria, Va., and

EUROPEAN WIDGEON.

occasionally along the coast of California. One full plumaged male was killed on the Illinois River, and one full plumaged male was killed on Long Island in 1899."

The description given by this author, exactly fits the specimen now in my possession. It is: Adult Male: Forehead and top of head white; sometimes buff (mine is buff); rest of head rufous brown; cluster of small green spots behind eye; chin and throat black; breast, pinkish-brown; back and sides undulated with black and white; wing covers, white; speculum green; lower parts white; under tail covers, black; tail pointed, brownish, becoming black at tip; iris, hazel; bill, slate; nail, black; legs and feet, slate, with dusky webs.

That it occurs more frequently than is supposed would be indicated by the fact that in some localities gunners speak of a red-headed widgeon, supposing the bird to be a cross between the red-headed and the common (American) widgeon. The widgeon has been known to reach the age of twenty-three years.

Any correspondence giving data concerning this bird will be much appreciated by

H. LINDLEY,
Chairman of the Ornithological Bureau.

[The author of "American Duck Shooting" says of the European widgeon: "This species belongs to the old world, yet has been over much of the new. It occurs regularly in Alaska and breeds there, and, no doubt, it is due to this fact that it has been killed in California, Illinois, New York, Pennsylvania, Maryland, Virginia and Florida. I have killed it in North Carolina, but it occurs there so seldom that it is not at all known to gunners, and my boatman, when he picked up this bird, took it at first for a redhead and afterward for a hybrid."

Since this was written we have known of several other specimens being killed in North Carolina, where the European widgeon when seen is usually found associated with the American widgeon or the gadwall.—EDITOR.]

The Recent Exposition at Odessa.

ALTHOUGH the recent exposition at Odessa was gotten up by the Imperial Society of South Russia, aided by nearly all branches of industry, art and culture, it was not a financial success, says Consul John H. Grout.

Among the many causes of this, the two following are given: An exposition at Ekaterinoslav, 250 miles distant, and in the vital center of Russia, which was well managed and well attended; and the prevalence of cholera, which, although in a mild form, kept many people away.

Of live things, perhaps the greatest attention was drawn by the exhibit of a wealthy landowner, who devotes much of his time and spends large amounts in the acclimatization of various exotic animals, such as zebras, antelopes, bison, Asiatic wild horses, birds, pheasants, flamingoes, ostriches, etc., and to the domestication of some of the wildfowl which were so plentiful here at one time, as, for instance, giant bustards, of which a fine pair, perfectly tame, but a little vicious, were exhibited. The greatest interest in this exhibition centered in the crosses between horses and zebras, and between bison, as well as the Russian "zebur," and domestic cattle. The first are very finely marked animals, of the size of the pony, bulky, strong, and good workers, but not capable of propagation, either with horses, zebras, or among themselves. The hybrids from bisons and domesticated cattle were fine large animals, capable of further breeding with pure-blooded bison or cattle. They are somewhat intractable but submit to the yoke, and are expected to give finely flavored dark meat. There were also some pure-blooded American and European bison born upon the estate of the exhibitor. In this way bison may be saved from extinction by the infusion of new blood, and by forming separate herds, widely apart, from which procreators may be circulated.

Endowment Fund for the New York Zoological Society.

SINCE its establishment the New York Zoological Society had contributed, up to the end of the year 1909, nearly $500,000 in annual contributions and outright gifts to its park in the Bronx. Of this great sum, a large portion was spent on building walks, and other construction work at the park, which work ought to have been borne by the city, which the Park so greatly benefits. Nevertheless, as the city was slow to provide funds for this work, it seemed best to the society to do it in order that the public might realize what the Park was and might have some intimation of what it would be.

In December, 1909, the Executive Committee of the society determined that the time had then come for the establishment of an endowment fund.

AMERICAN WIDGEON.

This was required for many reasons, of which the perishable character of a collection of living animals is one of the most obvious and important. The animals in such a collection cannot be compared to the objects gathered in a museum or a library. Those are permanent and constantly increasing in value, while living animals collected from all parts of the world, held in confinement and necessarily under more or less unnatural conditions, need to be constantly replaced.

The park having been substantially completed, stocked with animals and established in the public esteem, the society felt that the next essential step was to provide the nucleus of an endowment fund of at least $1,000,000 for the following purposes:

(1) Permanence of the society and thus of the park and aquarium.

(2) Scientific exploration and publication such as is conducted by other similar societies in other parts of the world.

(3) Protection of animal life as the society's part in the great conservation move-

U OF ILL UB.

ment, which is going on not only in the United States but all over the world.

As a beginning it was decided by the Executive Committee to raise, before the first of January, 1911, by subscription, the sum of $250,000—and with the assistance of the friends of the society, this amount was secured. The income derived from this initial sum of $250,000 will do little more than enable the society to comfortably carry on its work on the present basis, without any enlargement or extension, but it is hoped that this amount will soon be increased through special subscriptions, and through bequests, until the sum of at least one million dollars is reached. The income from a million dollars would enable the society to greatly extend its work.

The thanks of the society and of the City of New York are due the subscribers to the fund, whose generosity has made this splendid beginning of the fund. Their names are as follows:

Samuel Thorne	$25,000
Jacob H. Schiff	25,000
George F. Baker	25,000
Cleveland H. Dodge	25,000
J. Pierpont Morgan	20,000
Est. Phoebe Anna Thorne	10,000
Ogden Mills	10,000
Levi P. Morton	10,000
Percy R. Pyne	10,000
Edward S. Harkness	5,000
Andrew Carnegie	5,000
Miss Emily Trevor	5,000
A Friend	5,000
Samuel P. Avery	5,000
Frank K. Sturgis	5,000
John L. Cadwalader	5,000
George C. Clark	5,000
George W. Perkins	5,000
Robert S. Brewster	5,000
Henry A. C. Taylor	5,000
John D. Archbold	5,000
Frederick G. Bourne	5,000
Charles F. Dieterich	5,000
George J. Gould	5,000
Hugh J. Chisholm	5,000
Mrs. F. F. Thompson	5,000
Lispenard Stewart	2,500
Miss Serena Rhinelander	2,500
Grant B. Schley	2,500
F. Augustus Schermerhorn	1,000
Walter B. James	1,000
Miss Helen Miller Gould	1,000
Miscellaneous	1,055
	$256,555

The possession of this fund and of the greater fund of which it is believed this is only the beginning, will make it possible for the New York Zoological Society to accomplish a great work in science and in economies. Preparations are on foot when the city shall have provided means for changing the Aquarium buildings, to establish on one of the upper floors a great marine biological laboratory, which should take its place among the best in the world.

The Zoological Society has already shown its interest in the nation's welfare by stocking the Wichita National Game Preserve with buffalo. The society, notwithstanding its name, in fact is far more than a local organization. It belongs to the whole country and its purpose is to work for the whole country. Many methods suggest themselves as to how this may be done, but just how the thing will work itself out is as yet unknown. It is a fortunate thing for the United States that so great and so popular an institution as this is determined to offer its services to the country at large.

It was at the seventeenth annual meeting of the New York Zoological Society that the announcement of this endowment fund was made by Madison Grant. The meeting was held in the Waldorf-Astoria Hotel the night of Jan. 10,

THE OWL.
Photographed by Mr. Smith.

and Prof. Henry Fairfield Osborn presided. In his report as chairman of the executive committee, Mr. Grant laid special emphasis on the advantages to members of the society's new Administration Building and on the importance of the National Collection of Heads and Horns. He also made an earnest appeal for the proposed new Aquarium in Battery Park, funds for which the city will be asked to provide; and spoke of the efforts that are being made to secure additional protection for birds.

On this subject Frank M. Chapman submitted the following resolution:

Whereas, the widely diversified statutes of the various States of the Union relative to the protection of wildfowl are entirely inadequate for the preservation of game birds, and

Whereas, many species of birds in their annual migrations traverse the entire length of the United States, and pass through many distinct jurisdictions wherein the laws vary greatly, with the result that the birds are unduly persecuted and are drifting rapidly toward the verge of extinction,

Now, therefore, be it resolved, that the New York Zoological Society urge Congress to provide by Federal statutes for the protection of these birds, and be it

Further Resolved, that if this course should be found impracticable, that the New York Zoological Society urge the various States in the Union, particularly along the main routes of migratory birds, to unite in uniform laws for the conservation of the wildfowl of America.

Another resolution presented by Mr. Chapman is as follows:

Whereas, it has been generally asserted in the public press that certain commercial interests in the city of New York will endeavor at the coming session of the Legislature of the State to repeal Section 98, Chapter 24, of the Laws of the State of New York, restricting the sale of the plumage of wild birds, and Section 241, Chapter 24, relating to the possession and sale of game birds during the close season, and

Whereas, the market hunters of Long Island have declared publicly their intention of securing the repeal of Section 170, Chapter 24, of the Laws of the State of New York, prohibiting the spring shooting of wildfowl, and

Whereas, the laws as they now stand are barely sufficient for the protection of our wild birds,

Now, therefore, be it resolved, that the New York Zoological Society does hereby condemn any attempt to modify the existing statutes in the aforesaid manner, and be it

Further Resolved, that the officers of the Zoological Society be instructed to take such steps as may, in their judgment, be most effective to provide for the maintenance of the existing provisions of law for the protection of the birds of this State.

Curiosities of Evolution.

NEW YORK, Jan. 3.—*Editor Forest and Stream:* Have naturalists any theory as to the formation of the eyes on the wings of the tiger moth? Seen at a distance, these have the most wonderful resemblance to a tiger glaring from a tropical jungle. I have puzzled my head trying to imagine how they came to be formed. Of course, it is a case of evolution, but what was the primal impulse or cause? That is the question.

Another curious phenomenon is the mark on the breast of the bleeding heart pigeon. It resembles exactly a dagger wound. Can any ingenious naturalist throw a little light on these marvels of evolution? They cannot have been merely fortuitous or the work of chance. The resemblance is altogether too perfect for that.

FRANK MOONAN.

An Owl Attends a Lodge Meeting.

SOUTH NORWALK, Conn., Jan. 5.—*Editor Forest and Stream:* The Acadian owl that I had in captivity for a day flew into the lodge room of an order holding a meeting in Norwalk, Wednesday evening, Dec. 7. The owl was very tame and the first thing that he did was to fly and alight on the head of a redtail hawk that I had mounted, and he sat there and allowed me to take his picture.

WILBUR F. SMITH.

Mr. Pinchot on Conservation.

AT the Hotel Astor, New York city, last night, the North Carolina Society held a banquet, at which Gifford Pinchot spoke on "Conservation," with particular reference to the proposed Appalachian forest reserve.

GAME BAG AND GUN

Two Thousand Miles for Moose and Caribou.

On the night of September 7th, 1908, with a friend I started from home in Ridge Spring, S. C., on the long trip to Bathurst, N. B. It was our first visit to Canada for a moose and caribou hunt.

Necessarily we had had quite a little correspondence before deciding on Bathurst as the place and Imhoff Bros. as guides. There being six of them, and as we only wanted two, we engaged Gilbert and Alphonse. So far as we found they are all splendid fellows and excellent guides and cooks.

We had no little trouble in deciding what kind of rifles to take for this special kind of game. We studied weight of bullets, velocities, trajectories, energy and such matters; read for months the arguments of different writers on the relative merits of large and small bore rifles, and after having read it all we were about where we started at the beginning, so far as being able to decide what was really best, whether 30-40, 303, 35, 405, 45-70 or 45-90 high velocity. I even wrote one of the celebrated manufacturers of rifles for advice as to which of the company's rifles were best for moose, but they answered by sending us one of their catalogues and expressed the hope that when we did buy, it would be one of their make, but did not offer any advice as to which one was best for moose.

About that time we had a letter from the guides asking us if we had purchased our rifles as yet, and if we had not, they would be glad to know what we had in mind and that they would be glad to give us their expert advice. We wrote them, stating our preferences. They replied that those we contemplated purchasing were good rifles, but advised 35 cal. automatic rifles, and we took their advice. More of these arms later.

Arrived at Bathurst, we spent Saturday and Sunday at the hotel. Monday I rose early to meet the guide at the station when the morning train came. A. C. Imhoff I found a very pleasant fellow indeed; in fact we found all of the guides competent and thoroughly good fellows. After breakfast, we having bought our licenses the day before from the post master, Henry Bishop, there was nothing to do but wait until Imhoff was through with his purchases, and finally were off to the Imhoff settlement, about twelve miles over a splendid road, so good in fact as to make one wish for an automobile, or better still a horse, in order that time could be had in which to enjoy the beautiful scenery along the road.

At the settlement we donned our hunting togs and were ready for the great woods. With Gilbert and Alphonse we went to a field near the house to try our rifles, and found them to be very handy and accurate. The outfit having been loaded on Joe Doucet's wagon, drawn by his two fine horses, we were at last ready for the tote road; and what a road! The way those horses went over it with their load was a revelation to us. By taking a trail which was more direct we shortened the distance and struck it again after several miles and waited there for the team to catch up. On the way we saw our first moose track, a pretty big one too. After going twelve miles we came to the first camp, Wild Center, and a more fitting name it would be hard to find. There we spent our first night in the wonderful Canada woods, never to be forgotten. This camp, built like all the rest, of logs, was the newest of their camps. It was built during 1908 and we were the first party to occupy it. It was quite late before we tired listening to the guides' talk and turned in, for such sleep as we could get before day.

CAMP WILD CENTER.

THE HUNTERS AND THEIR TROPHIES.

Early next morning we left with Gilbert, Joe and Alphonse following with the team. Being in a splendid game country, we were now on the watch for game, and we saw plenty of moose, caribou and bear signs. Our destination was Camp Big Moose, where we were to hunt. I carried a .22 caliber pistol for partridges and got several which, with trout caught near the trail in a splendid trout stream, constituted all the game we saw until we reached camp, about noon. When we got near enough to camp to see clearly we discovered that two of the windows had been broken, the bears having paid the camp a visit before us, and not knowing how to raise the latch, went through the

windows. The guide told us a bear always provides two openings before he goes in. Inside we found things torn up, the table cloth pulled off, dishes broken, a sack of flour ripped open, pickles and a can of lard upset. We spent the balance of the day resting while the guides cleaned up the camp and made spruce beds.

Late in the afternoon we went with Gilbert a short distance to a moose wallow, but saw nothing. The next morning after a breakfast of trout and partridge we started out in earnest, all going to a dead water on Forty-mile Creek. We saw plenty of signs, but no game except some mallard ducks, one of which I killed with the pistol, which shoots equal to a rifle and which I would not think of being without. I prefer it to a rifle of the same caliber on account of its being so light and handy. For the afternoon we paired off, Gilbert and Albert, my partner, going to Spruce Pond, Alphonse and myself to a series of four lakes on Forty-mile Creek. This arrangement of guides we kept for the rest of the hunt. Alphonse and I had gone to two of the lakes without seeing any game, but on approaching the third he suddenly stopped and holding up his hand, whispered that he heard something in the water. Quickening our pace we went cautiously ahead and I too heard the noise in the water. Presently we were close enough to see over the alder bushes what seemed to be immense horns bobbing about in an excited way, but I could not see anything else. I stepped back just a little, hoping to see the body through a little opening in the alders, when Alphonse pulled me forward and pointed out the back of the animal, saying "It's a caribou, shoot him." I only had an instant to carry out his suggestion and taking a snap shot, did what most anyone would do under the same circumstances, shot over him and missed. Before I could shoot again, even with the automatic rifle, he was out of sight in the bushes. I ran up on a mound in front of me and saw the caribou going straight away. Up went the rifle for another snap shot and this time I saw the whole body and scored, hitting him a little back of the fore shoulders. Another bullet struck about two inches from the first and down he went into the water; whereupon I called out to the guide, "I've got him down," and ran through the brush to the water's edge where I would have an unobstructed view in case the bull should get up again. He was threshing around trying to get up, but couldn't, and on the advice of the guide I fired another shot and he went under the water with the exception of the antlers.

Didn't I feel fine about then? A caribou is a fine game animal, to be sure. Alphonse waited until he was sure the caribou was dead, then waded into the water, caught him by the antlers and pulled him out far enough for me to get hold, and together we pulled and rolled him out on the bank, where we took off the head and hide, cut up the meat, which he put out in the water on a rock, together with the hide. The head Alphonse took with him, and we went on to the fourth lake where we stayed for some time without seeing anything. Starting back we approached the opposite end of the lake where I had killed the caribou, when suddenly Alphonse dropped to his knees, at the same time beckoning me to do the same, and then telling me to come cautiously to where he was. There on the other side of the lake I saw my first moose, a cow, standing in the edge of the alders with head well up, the late sun striking her full in the face, making a picture never to be erased from my memory. She stood there as if posing for a picture, then disappeared so quickly and quietly as to make no noise whatever. When we walked into camp late in the evening, Gilbert and Albert opened their eyes pretty big, and Gilbert remarked "I would rather have that caribou head than have a moose."

They had heard our shots and Gilbert had remarked, "They have killed whatever they were shooting at, for I can tell by the way the shots were fired: two close together, then two more, then after a little while one more, which means coup de grace." It certainly was encouraging to have a nice caribou head in camp, and we sat up late that night and talked of caribou hunts in which the guides had taken part in previous seasons.

Alphonse and I went the same route on Forty-mile Creek next day, so that we could bring in some of the meat and the hide on our return to camp that evening. We went to all of the four lakes, waiting at each until we concluded no game was about that particular lake. On our return trip, when near the second lake coming in, where I had killed the caribou, we again heard something in the water, and the wind being favorable, we had no difficulty in getting to a point where to our disappointment we could see that it was a cow moose. However, I had a splendid opportunity to see her feeding, and watched for about two hours, thinking a bull might come in but none came. It was interesting to see her put head, ears and all, under the water and get something which she seemed to enjoy very much; and to see the change that came over her when we finally showed ourselves. She was within thirty yards of us, but being unable to get our scent, could not make us out. Finally she stalked off in a most majestic manner until she was about midway of the lake, when she turned completely around and faced us. Going on to the edge of the lake she again turned facing us, then she seemed to become alarmed in earnest and lost no time getting into the bushes, where she gave vent to what the guide called the cry of alarm, and was probably intended for her calf in the woods to know there was danger near.

At the last lake coming in, about one hour before sunset, it being still, the guide called from time to time but got no response. The weather was too warm for the moose to mate, so he said. To hear the guide call for the first time, and listen to the sound as it grew and swelled, roared and bellowed, rolling on and on over the hills and valleys, was a revelation.

At camp we found Albert and Gilbert. They had seen several deer and moose, but none with good enough head to shoot. I began to feel like the blood of Samson was running in my veins. Did I have an appetite? Ask the others how the trout, partridges, caribou steak and baked beans disappeared. My partner said, "If your wife could see you she would certainly be alarmed for fear you would make yourself ill eating." I replied that what I came for was something that would make me eat.

Getting away early, Alphonse and I followed the route taken by Albert and Gilbert on the previous day, and they ours. We saw plenty of signs but no game. Just after we determined to return to camp we walked into a bunch of partridges, and out of eight shots with the little pistol I bagged eight birds, which was enough for one day. After lunch we got the tackle and went for trout below the deadwater on Forty-mile Creek. We didn't expect to see any moose as the wind was almost straight down the way we were going, but of course the rifle as well as the rod went along. We walked about three and a half miles to the canoe landing, got into a canoe and rowed down stream, trying for trout in likely places as we went, getting several rises from small trout, but hooking none of them. Near the deadwater I noticed several rocks sticking out above the water about four hundred yards ahead, then what I took to be a rock proved to be a splendid head and antlers.

"Alphonse," I whispered, "look at the big bull moose!" The bull did not seem to see us and put his head under to feed again, which gave the guide the opportunity he wanted. He made for a little island about a hundred yards from where we first saw the moose, and the way he made that canoe go through the water was marvelous. In less time than it takes to tell it we were in the shallow water at the island and I jumped out of the canoe and ran for the island in order to have a steady footing from which to shoot should the moose discover us and start off.

Twice the moose raised his head to chew and breathe without getting our scent, but at the third time the wind must have gone from us straight to him, for almost immediately after his head came up he pointed his nose directly toward us and held it there for several moments, then turned and started straight away. I had never before shot game at anything like the distance and had only shot my rifle at a distance of one hundred yards, while the moose was about 300 yards distant, I determined not to raise the rear sight but would depend on taking a coarse front sight. The guide told me he could not give me any advice relating to adjusting the sights, but told me to begin shooting and I could get the range by noticing where the bullets hit, but I told him I would wait until there was more of the body exposed for a target before I started to fire, and gave him two extra clips to hold in readiness. He said the moose was getting further and further away all the time, but I waited until I could see the entire body. Then I carefully got the sights in line, figuring that if I shot low the ball would be deflected and lose only little energy from striking the water, and would very likely hit the moose. This it did, striking the water and hitting the moose in the hip. I then took a little coarser sight and fired again, hitting him just a little to the right of the base of the tail, which knocked him down with a tremendous splash, and the guide said "You have got him, you've got him," but the next second he was up and going as if nothing had happened to him, turning his left side to me at about an angle of forty-five degrees. I aimed back of the fore shoulder and fired, striking him squarely back of the shoulder, with no apparent effect save to make him turn around with his right side toward me, at the same time getting on a high place in the bed of the stream.

My next two shots went low; I could see the bullets strike the water underneath and beyond him, Alphonse said "You are shooting too low, shoot higher." I replied "I am out of ammunition, give me another clip." Loading, I fired five times at the shoulder, hitting the bull three times an inch or two apart in the centre of the shoulder, and once at the base of the neck, the other bullet barely touching the skin of the back. Still he went on as if nothing had happened, and before I could get the contents of another clip into the magazine he was up on the bank and gone.

Alphonse started for the canoe, I following close at his heels, and in a minute we had the canoe out into the deep water and were paddling down stream to pick up the trail.

At about the place we thought the bull went out we saw a big moose track and beached the canoe, but soon saw that the track was an old one and that we had stopped too soon.

We tried to go through the bushes to pick up the trail, but found them too thick. The guide then went around the edge of the stream, and in attempting to follow, I went into the mud half knee deep, and in trying to extricate my feet fell flat on my back. Fortunately the mud where my back was, did not have the consistency of that which held my feet. I caught a limb and pulled myself out to firmer ground. The guide, unaware of my predicament, called out, "Come here quick. Here he is!"

I had been thinking all this time that perhaps after all my shooting the moose would get away from us, and when I heard Alphonse call, I naturally thought the moose was making a stand and that he might move on at any moment. It can therefore easily be imagined how anxious I was to get close to him, but how I was to get to this right then was the point, for I had tried to go through the bushes and failed and along the edge and bogged, so I said "I don't see how I can, for I've bogged up in the mud trying to follow you." The guide's "You have got to, come on," was enough, I was sure then that if I did not get there instanter the moose would be gone, and rushed around that bit of unstable ground so quickly that there was not time to get stuck in the mud again. Fifteen or twenty steps up the bank lay the moose, stone dead. The vitality a big moose possesses is marvelous.

The first thing I did was just what, I am told, everyone does: I caught hold of the head to examine the antlers, and as I pulled the head over so that I could the better see the left antler, there was a good big piece of velvet still sticking on to the tips of the points, for which I was very glad. This was my first moose, and with all of its wild setting, all who have experienced it know how I felt, and those of the great brotherhood of hunters who have never killed a big bull moose will have to wait until they do before it will be possible for them fully to appreciate how one feels, for I do not believe it possible to express it, like so many of the finer feelings. It was about two o'clock when I killed him, and after standing around admiring the big fellow, Alphonse got out his metal tape measure and said "what is his spread?" I said "48," he said "54," but both had overshot the mark; it was 45½ inches, and while not as wide as some, the antlers were very symmetrical, with 23 points and 15-inch blade, good enough for me, and I was happy. Think how far I had come for caribou and moose, and now that I had them, why should I not feel good? I did.

Out came our hunting knives to take off the head and hide, the hair of which was a rich dark color almost black. We were 5½ or 6 miles from camp, and after we had finished taking off the hide and head we loaded them in the canoe and took them to the landing, and from there to camp, three and a half or four miles, we had to take them on our shoulders, which we did by taking turns, first one with the head and then the other. The trail from the landing to camp was over logs, rocks, down and up, in places the trees growing so close, it was almost impossible to get through, and it was dark when we finally reached camp. And didn't we strut in, you say? well, perhaps we did, and I don't believe you would censure us for it. Gilbert and Albert were much surprised, for they had not heard our shots.

In addition to the heads and hides I took out with me both of the front feet of the caribou, which I had mounted as ink wells for my two boys. To the youngest I gave the caribou head, and to the oldest the moosehead, one of the front feet of the moose I had mounted with a thermometer, which together with the hides, nicely tanned with the hair on for rugs, I gave to my wife. The piece of velvet, the birch horn the guide used to call, and some pieces of our spruce bed I kept for myself, together with the memories of the pleasantest trip of my life. When it was time for Joe to come with his team and wagon, I was sorry I had not told him to come later, for I was loath to leave the woods and Camp Big Moose, and on the morning when we left, with the frost twenty to thirty feet high on the spruce trees, the ice half an inch thick, the sky as clear as crystal and bluer than the ocean, I turned and looked back at the camp with deepest regrets that time was up, and business necessitated my return to South Carolina and home.

In conclusion I will briefly sum up the behavior of the .35 caliber automatic. It shot without a hitch, the recoil was hardly noticeable, the trajectory was very flat, the clip loading device of utmost value, it was light and therefore easy to carry. It handled well, as was shown by its effectiveness at the caribou while on the run and in the thickest kind of bushes with only a second of time in which his body could be seen. It was a hard hitter, as was shown by the explosive effect on the caribou at close range, the bullet making a hole the guide put his fist in, and knocking the moose down when hit near the base of the tail at a distance of nearly or quite 300 yards. I would say, however, get as close as you can, to be more certain of getting your game, even if you are sure of hitting the game at the greater distances, on account of the higher velocity and consequent greater explosive effect of the bullet. Finally I have come to the conclusion that for moose the most powerful rifle and cartridge are not quite powerful enough, and for my next trip I have bought a 405 caliber box magazine rifle, which is well balanced and should have great stopping power. This is what is wanted, as it is possible you may get only one shot, and you want that to count.

F. G. ASBILL.

Hunting the Bobcat.

THE item "Hunting Bobcat" in your Dec. 3 issue seemed all right until I read the last paragraph. That caused a smile.

A number of years ago I spent the winter on a sheep ranch about eighteen miles from Eagle Pass, Texas. The country was wild then—we were 250 miles from the nearest railroad—and game of all kinds was very plentiful.

At the ranch we kept a pack of seven hounds bred and used exclusively for cat hunting. Now there is no place in the world where a tenderfoot or "short horn" is allowed—I might say encouraged—to display his ignorance with less opposition than among cowboys or sheep men.

Reared as I was in Maryland, I have known of and enjoyed 'coon hunting all my life, and one of the chief pleasures, when we tried a 'coon, was to cut the tree down, or to climb up and punch him out and have him fight the dogs.

The first cat hunt I went on in Texas we treed a bobcat that probably weighed about twenty-five pounds. The tree was a mesquite and the cat was about twenty feet from the ground. According to custom the boys were going to shoot him, when the tenderfoot exclaimed, "Oh, don't do that; let me climb up and punch him out and let him fight the dogs as we do the 'coons back in the States." Did they let me? Sure; I did not hear one word of objection.

I easily climbed up to within punching distance and with a six-foot stick proceeded to punch the bobcat that, according to the above mentioned article, "has never been known to attack a man, even when in order to make it sit up and look pleasant it has been teased with a short stick among the branches of its arboreal retreat." The bobcat was facing me as I climbed up, and his remarks showed he did not care for closer acquaintance. At about the third punch he jumped and for a month afterward I could show proof that he did not jump toward the dogs. Claw marks in both shoulders and teeth marks in my arm that I had interposed to protect my face and throat proved conclusively to my mind that they will attack, and that with very little urging.

We sailed out of that tree together. I did not stop to climb down, just let go everything and sailed. Fortunately for me the minute we struck the ground, the dogs took a hand, and relieved me of my most unwelcome companion.

When I had time to look around I thought the boys were having fits. They nearly rolled out of their saddles—we always hunted on horseback—laughing at my "great act." To them it was probably funny, but the next time we wanted a cat, and we killed dozens of both the bobcats and the spotted cats—ocelots—during the winter, we sent for him with a pistol ball. H. L.

A Tagged Mallard.

SMITHTOWN, L. I., Dec. 31.—*Editor Forest and Stream:* While duck shooting Friday last on the Nissequogue River at the Wyandanch Club I shot a drake mallard tagged with metal band No. 2852 *M*—.

He was leading (in flight) half a dozen black ducks. Can you in any way assist us to ascertain "whence he came," as someone, judging by the number, must be liberating large quantities?

SIMEON J. DRAKE.

Changes in Elk Legislation.

CHEYENNE, Wyo., Jan. 6.—*Editor Forest and Stream:* The Wyoming State Legislature, which meets next month, will be called upon and will undoubtedly give the Wyoming game laws a general revision and correction.

It will be remembered by readers of FOREST AND STREAM that a peculiar blunder was made two years ago by which a clause was inserted in the game laws placing elk in the restricted list when elk were so plentiful they were starving by the hundreds and even the thousands in the worst winters; but the restriction was an error, and was recognized as such by all sportsmen and game wardens.

Word was sent out by the game wardens that the shooting of elk would be allowed as usual, and as the game licenses (which were equipped with coupon tags, one for each elk, deer or mountain sheep which could be killed under the law), were issued, the hunting of elk has continued about the same as usual, in spite of the fact that an error in the laws prohibited it. Which only goes to verify that statement, "that no law is effective unless the people stand back of it."

The people of Wyoming are now demanding that this error be corrected, and that other changes be made in the game laws. Those who are working on proposed game laws will ask that the resident and non-resident game licenses for elk be issued more freely and at much smaller expense, the price for a license to a non-resident now being $50. They will also demand that each hunter be allowed to bag two elk instead of one on the same license. The old law provided that a second elk might be killed by taking out an additional special elk license. This license may be retained in force and make it possible for the hunter to secure a third elk on it if he wishes.

Under the existing laws, antelope were protected from 1909 to 1915, and there is some talk of again opening the season on antelope which has now been closed for two seasons. This, however, will meet with opposition, for the antelope are scattered over the State so generally that different sections are divided on the antelope subject. In some places they are plentiful and could be killed without danger of exterminating them, while in other sections there is no question about their requiring constant protection for several years yet to come. The male mountain sheep can be killed under the present law, one each season, and this regulation will probably not be changed, as the sheep range so high up in the mountains during the game season that they are under a natural protection of topography and weather conditions, which make their quest so hazardous and difficult that there is little danger of their extermination by hunters.

A new situation in the elk hunting has grown up since the last game laws were passed which will require special legislation. The sportsmen's club of Sheridan, in the northern part of the State, has liberated thirty-five young elk in the Big Horn Mountains for the purpose of restocking this district, which was in early days a natural elk range. These elk were taken from the Jackson's Hole country in the western part of the State in the spring a year ago, when they were in danger of starvation, and they soon picked up on a diet of hay and were in a good condition for a 500-mile trip by rail to their new feeding grounds. I walked into the car in which these young elk were being shipped and found them very gentle and unaggressive. Although they had been out on their natural haunts but a few days, they were not very wild, and few of them made any objections to being stroked about the head or nose.

These elk are now straying somewhere about the Big Horn Mountains, and are under protection agreed on between sportsmen and ranchmen, which is probably more effective than laws; but the coming Legislature will be asked to prohibit the hunting of elk in the Big Horn Mountains for a term of five or six years. More elk will probably be planted there, and within a few years it is expected that they will multiply, and there will be another fine elk hunting ground opened up in this State. Of course the hunting of elk in the Jackson's Hole country, south of the Yellowstone National Park, will not be cut off at this time.

An effort will also be made during the next Legislature to have the season on elk open earlier in the Jackson's Hole, for when it opens under the present law, on Sept. 25, the weather is in some years so cold that many hunters are prevented from going up into the mountains where elk can be found. At the same time, this would make it necessary to have a different game season placed on deer, as they feed in the lower hills and can be reached more easily than the elk. Under the present law the same open season, from Sept. 25 to Nov. 1, was placed on all large game.

The one subject which has been a great source of discussion among legislators, ranchmen and sportsmen will come up at the coming Legislature. That is, in regard to the feeding of elk in the winter and spring months when they come down into the valleys of Jackson's Hole to escape the deep snow and cold of the higher mountain ranges, which cuts off all access to the grass and feed. As it is estimated there are 50,000 live elk in this territory, when they are forced in such large bands into the lower lands which are pretty well eaten off by the domestic stock, a most appalling loss from starvation is always the result if the spring weather is severe. During the last two years they have been fed both by the ranchmen and by the State game warden, an appropriation of $5,000 having been made by the Legislature two years ago for this purpose. This sum was about exhausted during the first winter, and as the Legislature was not in session last winter, there arose a serious question as to how funds could be raised for their protection. As the spring opened early, the loss was fortunately not great last year. But as the law-makers cannot forecast the weather conditions for two winters in advance, they will be asked this spring to make provision for feeding elk on an estimate sufficient to cover two severe winters.

The people of Wyoming consider these great herds of wild elk one of the State's most valuable assets. It can easily be figured that they have a high commercial value in meat, hides, horns and teeth; but are worth more to the State as an attraction which no other State possesses, a large revenue being reaped annually from the sale of non-resident game licenses, from the money expended by large hunting parties going into the game country, and from fines imposed on those who violate the game laws. The State officials believe they are able to adequately protect these magnificent monarchs of the forest both from slaughter by avaricious hunters and from the ravages of cold, starvation and carnivorous wild animals.

An effort was started a year ago to have a new national game reserve set aside by Congress in the Grovont country, east of the Jackson's Hole, as a winter feeding ground for elk, where the range would be kept free of domestic stock and reserved for the elk; but as this is quite high and covered with deep snow in winter, there is some doubt about the wisdom of this proposition, and it is being opposed by those who wish to see this country settled up by homesteaders and farmers.

The elk question is a big and many-sided one. The various commercial interests of ranchman, some of whom are bothered by elk breaking into their hay stacks in winter, while others reap a revenue from visiting hunters; of land agents who wish to sell farm lands or locate settlers on lands proposed as elk reserves; of game wardens and guides, each of whom has various theories to advance, perhaps with some financial gain involved; of hunters, some of whom desire ample hunting privileges and proper protection for elk; and of the law-makers, to whom the demands of these various interests are made by their constituents, all make the elk situation a most complex one, which must be handled with care and forethought. But the main purpose of the State officials is to give the elk proper protection at all times and from all sources, and this will be the aim of the coming Legislature.

WM. A. BARTLETT.

Quail Experiments.

RALEIGH, N. C., Jan. 7.—*Editor Forest and Stream:* At Pinehurst, this State, remarkable success has been won in the rearing of quail. At several other points these birds have been raised in captivity. So far not much has been done with the pheasant, except at one or two preserves near High Point. Numbers of quail have been taken to Pinehurst from the West for purposes of experiment. This year the number of birds is much larger than usual in most parts of North Carolina. In many cases the birds are very wary, and take to trees on their first flight, hiding in the pines very adroitly, usually getting in a fork of the branches and staying there until the hunter passes. I found this to be the case several times this season and dogs have been noticed lifting their noses in the air and looking up into the trees, evidently knowing that the birds are not on the ground, and perhaps seeing them where they are perched. In many cases the birds will fly directly after the hunter has turned his back upon them. The quail are learning things and they have not a little of what may be termed more than instinct. FRED. A. OLDS.

All the game laws of the United States and Canada, revised to date and now in force, are given in the Game Laws in Brief. See adv.

Forty-five Minutes with the Geese.

SELBYVILLE, Del., Jan. 6.—*Editor Forest and Stream:* Possibly some of the many readers of your very interesting paper would have enjoyed being in the blind with my friend V. and myself some weeks ago, shooting geese. I can assure you I would have enjoyed the company of many of my old shooting friends of years gone by, but the Great Spirit has so arranged it that possibly we may never meet again, and this is why, with your permission, I want them to know where I am and one of the many things I am trying to still do—point my gun straight, as well as my character.

Friend V. and I agreed, as we had tramped the fields enough after quail, to give our dogs a much needed rest and hunt bigger game. While we are up with geese, we are behind with quail, on account of the scarcity of the latter.

We procured three days' provisions and aboard the gasolene boat we went, stopping on our way to get the bayman and his live geese decoys and sailboat. When we landed on the shooting grounds, it was 8:50 o'clock, and a fine sunny morning. As no geese were in sight, the bayman started up the bay to see if some could be found, while V. and I fixed a nice warm blind out of reeds and grass with a few bushes broken and stuck in the marsh with grass thrown over them.

I had brought along a few shells loaded with No. 7½ shot, intending, while waiting for geese, to shoot a crow or lark as it flew by while V. dozed a little in the hot sun. The decoys had been hobbled and staked off some twenty-five yards from the blind, and I was just about to shoot a lark, when I heard that familiar sound over my head—wish-wish-wish—and behold! there were about seventy-five geese going over our heads. A quarter of a mile down the bay they turned and pitched in among our decoys. Our geese were surely saying something to them, the prettiest and sweetest music I ever heard. One can talk of fox or rabbit hounds for music, but geese are good enough for me. After listening a moment I roused V. as the geese pitched among our decoys and pointed through the blind. I shall never forget the look in his eyes as he asked, "How did they get there?" I told him they just fell out of the clear sky. We got upon our knees to shoot, as we never shoot geese over decoys until they are on the wing, for fear of shooting a decoy. When the rumble was over, V. Said, "Floyd, we got two." I told him he was wrong, for he had killed two and the one I shot at was still going. I never held any better in my life, and I was studying how it could happen, when V. said, "Let me see that empty shell." To my surprise, I was shooting 3 drams and No. 7½ shot.

These geese pitched down not more than two hundred yards away and twelve of them started to swim back. We made up our minds to receive them in good sportsmanlike fashion. On they came until close enough, and our guns made more noise. Two fell to our first shots and five for the second.

Down the bay they pitched again. The baymen, hearing the noise and starting back, saw the geese and drove the remaining seven back to us, and we brought down six this inning, making thirteen dead, with one old gander going away saying something in goose language.

We concluded we had plenty and had started to pick the thirteen geese up, when to our surprise, we looked up the bay and there came that lone gander, sixty to seventy-five yards high. He was talking and our decoys probably told him to come along. When he was about sixty-five yards away I poked that old single-trigger of mine out and touched it off, and the gander went into the pile with the thirteen, making fourteen down in three innings in forty-five minutes.

My advice is, never take in the blind when shooting wild geese, any other than goose loads—all the powder that the ammunition company will load and 1⅛ ounce BB shot—for a wild goose is not so hard to hit, but is hard to kill.

C. W. FLOYD.

Governor Dix's Message.

IN his annual message to the New York Legislature, Governor John A. Dix had this to say regarding the State's natural resources:

As to the Forest, Fish and Game Commission and the State Water Supply Commission, under these heads I wish to call your attention to the very important question of the conservation and proper development of the natural resources of the State. It is now generally recognized that much of our prosperity, health and progress depend upon a continuous, all-year supply of pure water for the people, and that this can be assured only in great quantities by the preservation of the forest lands of the State.

Intertwined with these questions is that of the proper development of the great water powers which are now permitted to go to waste and the proper utilization of which would result in bringing to the State an annual revenue of many millions of dollars as well as adding greatly to the wealth of the people. The State has been buying from time to time large tracts of woodland, and as all of these matters are related in one form or another to each other, it has seemed to me to be the part of wisdom that they should all be placed under one jurisdiction, to the end that they may be all treated in such manner as to ensure to the people their development along the most efficient and at the same time the most economical lines.

The Constitutional Convention of 1894 contemplated the preservation of the Adirondack forests of this State. The intent to preserve carries with it the necessity to conserve, and a constructive administration of the forests involves the development of the natural resources in the forests. In order that the State of New York should derive the full benefit of those resources, either developed or undeveloped, it will be necessary to utilize all the forces which will aid in the advancement of this great Commonwealth. This State ranks last in the proportion of population productively engaged. Although we rank first in the total value of our manufactured products, other States are relatively in-

DEER IN YELLOWSTONE PARK.
From a photograph by G. W. Ridge.

creasing in their manufactured products faster than the State of New York, and this is particularly true of the coal-producing States. During a score of years prior to 1900 New York increased its manufactured products 100 per cent., Pennsylvania 157 per cent., Illinois 200 per cent., Ohio and Indiana 150 per cent. If coal from other States furnishes the heat energy, we pay the profit to the coal-producing States, although we have within the confines of this State power energy equal to all the power energy that can be produced from the coal mines of other States, and it remains only for us to conserve and utilize this power energy for the commercial and industrial development of our State. In the construction of the barge canal we are spending $100,000,000 to facilitate transportation of the products of the soil and of the factory, yet we have hitherto failed to take advantage of the hydraulic energy or power units which are wasted by the unfettered course of the water from the mountains to the sea. Cheap power is vital to manufacturing, and hydraulic energy is practically the only natural resource within this State for the development of power—that great and fundamental requisite to the prosperity and comfort of a civilized community.

The total power used in manufacturing in 1905 was 1,643,000 horsepower, of which 850.000 horsepower was produced by steam. To produce this 850,000 horsepower with coal throughout the year costs $85,000,000. To produce 850,000 horsepower by water and distribute it electrically would cost $25,000,000 per annum, thus saving $60,000,000 per annum. These figures interpreted mean that we are contributing $60,000,000 per year to other States for the purchase of coal.

This amount could be saved annually to the State by taking advantage of our own resources. Rivers, like other resources of nature, must be adapted to man's uses in order to reach anything like a reasonable degree of efficiency. Every river in the State exhibits such irregularity of flow in its natural state that the water power which may be developed economically from the present minimum flow is far below the average which can be obtained by means of scientific regulation. We should take advantage of these industrial benefits so as to increase the number and prosperity of the people by the location of manufacturing plants along our systems of waterways. In this way there would be increased prevention of damage by floods, and there would be increased general wealth and health of the people. The accomplishment of this great project should not be delayed if we are to maintain this Commonwealth as the Empire State.

Reforestation to perpetuate our forests is a vital problem to be solved by practical methods diligently applied. That we should purchase seedlings abroad to do a fractional portion of tree planting is a reflection on our forestry system, and I advocate active work being done to establish tree nurseries in various localities within the forest preserve, where ample shipping facilities are obtained. These nurseries should be on a commercial basis, affording abundant stock for tree planting in this State.

I recommend to you for these reasons, the consolidation of these departments into one body.

All the game laws of the United States and Canada, revised to date and now in force, are given in the Game Laws in Brief. See adv.

Cat and 'Coon.

Omaha, Neb., Jan. 7.—*Editor Forest and Stream:* My old ducking friend, Harley M. Smith, of River Sioux, Ia., was in my office one evening recently, and after a little chat on the prospects for next season's shooting, he said:

"I want to tell you of a fight I witnessed on Thanksgiving Day, while out looking up some late mallards I had seen going down in a certain slough the evening before.

"I built a blind of dead smartweed and sawgrass at the lower end of this slough, which was several hundred yards long, with the upper end thickly overgrown with wild plum trees. I hadn't waited more than an hour when a small bunch of mallards, those old red-leg fellows, came in and went down near the line of the plum trees. They had no more than settled below the tops of the tules, when they arose with a loud, discordant quacking and went off pell mell over the fields and out of sight. A quarter of an hour later a lone mallard came in, and after warily reconnoitering up and down the slough several times, always of course keeping out of reach of my little 16-gauge, he, too, went down near the plums. But he did not linger more than a half minute, when up he bounced with a vigorous squawking and flapping and disappeared in the direction the other birds had taken.

"Again a flock came in, a dozen, maybe, and they, after the usual circuit of investigation, settled down near the plum thicket. Again I was thrilled to see them rise almost before they had gotten their feet wet, all of them squawking frantically, and off they went over those same old fields as fast as their wings would carry them.

"With my curiosity whetted to an edge, I got up and slashed my way through the mud and weeds around to the upper end of the slough. As I cautiously approached the line of plum trees I heard a floundering and splashing among the tules, mingled with a spitting and whimpering that puzzled me greatly, and I realized that something unusual was going on. I crouched and carefully crept forward until I gained a clear view of the opening under the low trees, and you can imagine my feelings when I saw there a common tiger house cat and a big, fat raccoon facing each other as they squatted about a yard apart, the cat with her back arched and tail swollen and the 'coon with his thin lips drawn back showing his teeth. They had undoubtedly just emerged from a scrimmage, as both were bedraggled with mud and water. The struggle had evidently been long continued, as it was certainly the cause of startling the first bunch of mallards into such precipitous flight over an hour before.

"Anxious to witness the outcome of this interesting combat, I kept myself well hidden and watched the two animals closely. For ten minutes they remained in the same attitude as I found them, the cat caterwauling low and threateningly, and the 'coon whimpering plaintively as if anxious to compromise. But pussy was mad clean through, and all at once, as the 'coon lifted one of his fore feet, as if to turn and retreat, she was on him like a fury, and over they went, in a furry ball, into the low, roily waters that ran in quite a ways under the plum trees. It was a great mixup, and mud and water and fur flew in all directions. I could not see the struggling animals as well as I would have liked, while they were down, and clawing at each other as they rolled backward and forward, and was just about to advance to a better position, when there came a particularly loud squeak or squeal, evidently from the 'coon, and I saw the cat as she sprang up into the low crotch of one of the plum trees. The blood was dripping from her mussed features, and, I think, was not quite so full of fight as she had been.

"The 'coon, first glancing covertly up at the cat, raised himself to his haunches, and after wiping his pointed snoot and rubbing his frayed ears for a second or two, lowered himself, and with another look up at the still complaining feline, lumbered slowly away into the thick tules bordering the slough.

"I waited a moment, thinking there might be a renewal of the fight, but seeing nothing further of the 'coon, I stepped quietly forward, intending to see how badly kitty was hurt. But she did not appreciate my amiable intentions and flung herself out of the tree with a spiteful cry and slunk off among the amaranthine flags. I raised my gun, but was too late. I knew she was one of those devastating tramp cats and meant to kill her if I could, although at first I intended to offer her a helping hand.

"Looking about the spot, which was much trampled, and sprinkled with tufts of hair from both cat and 'coon, with many bloody splotches, I found a dead redbird—a cardinal—half buried among the broken down weeds and grasses. Which animal had stalked and slain the bird, of course I had no means of determining, but naturally inferred that it was the cat, as birds are the main diet of these predatory aliens.

"What puzzled me most was how the 'coon got tangled up with her. I never knew the two animals were hostile to each other, and the only animal I had ever known the 'coon to fight was old Joe, my 'coon dog, after we had shaken him out of a tree."

Henry N. Miller, of Wahoo, has been appointed chief game warden of Nebraska to succeed Dan Geilus.

While I do not know Mr. Miller personally, he is said to be a good man for the office, a well posted enthusiastic sportsman himself and much interested in all matters pertaining to the welfare of our game birds and animals.

Sandy Griswold.

Ocracoke Island.

Philadelphia, Pa., Jan. 4.—*Editor Forest and Stream:* If any of your readers want some real sport I advise them to go to Ocracoke, N. C. I have just received word that the ducks, brant and geese are there in untold thousands. I was there in November and had fair shooting among the early birds, but now they have all arrived and the gunning is ideal. Miah Garrish, or J. H. Fulcher, or the postmaster at Ocracoke, Hyde county, North Carolina, can give details as to accommodations, etc. A game warden who lives in the town has the issuing of non-resident licenses. A gasolene boat from Beaufort, N. C., makes daily trips. The place is ideal, for you get all the shooting you want without any of the usual discomforts and hardships.

Louis H. Parke.

Ducks Scarce.

NEW ORLEANS, La., Jan. 7.—*Editor Forest and Stream:* The severe cold weather of the past few days has made it almost impossible for the hunters to enjoy the sport. The prairie section, swamps and lagoons have been either frozen or filled with ice, and the lovers of the gun could not hunt with any satisfaction or pleasure. The ducks have sought shelter and warm places, and it has been almost impossible to get within good range of them in the last several days. The cold has been quite unusual. Warmer weather is predicted, however, and the hunters will be in their glory.

The season up to this time has been fairly good and large numbers of ducks, brant and geese have been bagged by hunting parties. Quail are quite abundant, although they have not been so plentiful in the public markets where they are usually sold. Some of the restaurant and hotel people claim that they have found it difficult to get quail this winter on account of the new law which limits the kill to any one hunter on a single day to fifteen. A number of sportsmen have killed a good many quail.

Wild turkeys have been only fairly abundant and probably not so many have found their way to this market during the present season as in the winter of 1910. The best turkey shooting is found in the central and northern portions of this State. Not so many deer as usual have been marketed, but deer are shipped here from various sections of the State in the greatest number in January and early February, and venison steak will be on sale at all the big restaurants in abundance this month.

Muskrats are being trapped in considerable numbers and their skins marketed. The fur animal record will show up well this year from present indications.

One of the local papers published a special dispatch from Montgomery to the effect that Governor B. B. Comer, of Alabama, will go on an extended hunt immediately after his retirement from office the latter part of this month. It is said that Governor Comer and a party will go to British Columbia and probably to Alaska to hunt big game. The Governor is confident of killing several grizzly bears. He has purchased a new rifle and ammunition to take with him on this hunt. He is one of the best known hunters in the South.

Last Thursday game wardens and Henry Jacobs of the game commission confiscated two shipments of game and sent them to the Jewish Orphans' Home and the Protestant Episcopal Widows' Home. One shipment was from Basile, La., and consisted of ten doves, eight robins, eight quail, three woodcock, one squirrel and three rabbits. The other shipment contained thirty quail and one dove from Opelousas, La. Neither consignment of game had the official tag attached to it and the shipper violated the law. Commissioner Miller says that each hunter is furnished with thirty-one tags each month, and if they do not attach one tag to each shipment, they can expect that their consignments will be confiscated.

A number of winter visitors are arriving here and a great many more are expected the latter part of the month. The largest number will come during February to witness the annual Mardi Gras festivities. It is expected many of the visitors will go on hunting and fishing trips. Some of the local hunters and fishermen have received notice of the coming of quite a number of friends from the East and the North.

F. G. G.

Spring Shooting.

SYRACUSE, N. Y., Jan. 7.—*Editor Forest and Stream:* Let us stop the shooting of ducks if necessary to preserve them. If they are to be shot, then let the law be a fair one. I have canvassed New York State, and the present law is very unsatisfactory, and while the shooters want to protect the ducks, they think a much more satisfactory law could be passed which would please the larger majority and at the same time preserve the ducks.

As I have given careful thought to this matter after consulting with gunners, I take the liberty of making the following suggestions to the gunners of the Northern States.

I believe in cutting down the shooting of ducks to even one day a week if necessary to protect them. If there was no shooting of ducks on Monday, Tuesday and Friday of each week, and the season extended in all States from October 1 to April 1 (ducks do not mate as a general thing until after April 1), and then cut down the bag limit to six or eight a day and prevent the sale of ducks I believe they would have ample protection—much better than under the present law. Such a law would be fair to rich and poor alike. If there was no selling of ducks it would knock out the business. We have as an example two men who killed 1,400 ducks on the North Carolina coast in a week and shipped them to Boston and New York city markets.

There will not be any incentive then for wealthy men to bait their points at other places, killing anywhere from forty-five to one hundred a day. A bag limit will stop that. Such a law would give the farmer boy, who has thousands of ducks on his back lot in the spring and none in the fall, a chance to get out and kill a duck legally and not make him a criminal.

If such a law as this could be obtained in all the Northern States, it would do away with the bothersome question of spring shooting. This question is the one that brings more ridicule to game laws, and more than any one thing I know of prevents the protection of other game.

I have no interest in this matter. I am taking the stand which seems to be most fair for those most concerned. A duck killed in its Southern flight cannot breed and one killed in its Northern flight cannot breed either. What difference does it make when one is killed? Better not be shot at all. But if ducks are to be shot, let there be a uniform law in the Northern States. Such a law can easily be obtained. Now let the gunners decide what is the best law. First consider the ducks, then let us have a limited amount of shooting and have it extended to those dates that give equal chance to all.

I believe such a law would be all the protection the ducks would need. Any man who wants more than six or eight ducks deserves never to shoot any. It is enough for any man, and it is a greater amount than the average New York State shooter can get in the fall. I say, come on, gunners. What is the best law for ducks? and then let us work to get it. Remember, cut the shooting so the ducks will hold their own or increase.

W. E. HOOKWAY.

Game in Saskatchewan.

REGARDING game, the Agricultural Department of Saskatchewan has this to say in its annual report for last year:

The district guardians have proved a valuable aid in the investigation of complaints and have while patrolling been efficient means of making known the game laws. The members of the Royal North-West Mounted Police have also done good service, and probably the greatest number of convictions for infractions of the game laws can be placed to their credit.

Patrols by our district guardians were systematically carried on throughout the season, and reports show a great improvement in the matter of observance of game laws. There is not anything like the amount of Sunday shooting that formerly went on, but there have been a few persons convicted for that offense this season.

From reports received from local guardians it appears that the first arrivals of geese and ducks were noticed about the third week in March, but it was well on to the middle of April before they appeared at all numerous. In parts where there was sufficient water to attract them, the ducks nested, being undisturbed by spring shooting, but prairie fires in some localities damaged many nests. Prairie chickens, to the surprise of many, have been fairly abundant in localities where they have been scarce or entirely absent. This is accounted for by the semi-migratory nature of this bird, which is influenced in its movements by the supply of food and other conditions. Crows are said to have been very destructive in some localities, many nests of eggs having apparently been destroyed by these birds, and the same complaint is made of coyotes. I notice reference is made in the papers to a club organized in the neighborhood of Moosomin for the purpose of reducing the number of crows by offering prizes for the greatest number of eggs brought in by the boys. The eggs collected totaled 1,800. This would not be a contravention of any law, the crow being exempt from protection under the useful birds ordinance, but it must not be assumed that the crow should be at all times classed as a harmful bird, as it undoubtedly destroys vast quantities of grasshoppers, cutworms and other insects which are injurious to crops. From the standpoint of the game protector it may be considered harmful, but it is a friend of the farmer.

Difficulty is still experienced with the Indians; of some bands who pay little attention to laws intended to help maintain a supply of game and which should have the strong support of the Indian Department.

The forest reserves have with the consent of the Dominion Government been constituted game refuges for the propagation and perpetuation of the native birds and animals, and all shooting, hunting, trapping or carrying of firearms within the boundaries of the reserves has been prohibited. This is, next to the prohibition of spring shooting, probably the most important legislation relative to the protection of game which has been enacted since the inauguration of the Province, and I hope other larger areas may soon be dealt with in a similar manner. From these refuges we may expect game to spread as it increases, and in this way benefit the surrounding country.

SEA AND RIVER FISHING

In the Land of Canaan.

My friend Fritz, having been long in city pent, came up in the latter part of June. With his arrival, following a quadrangular correspondence which had lasted through the winter and spring, our party was complete.

We were willing and ready to start, and the expedition got under way the next morning. In a chill fog before the dawn we set forth, bound for the Land of Canaan, Vermont. The Parson held the reins, and his little brown Morgans, the apples of his eyes, the winners of many blue ribbons at the county fair—gentleman's drivers they were—dashed out upon the open country road with all the energy of cagerness.

In the surrey were four men and one dog; namely, the Parson, the Professor, Fritz, I and Bingo. The last named was included in the load because he was a Dachshund and not built for pedestrianism. The surrey also contained, where some of our feet should have been, the various paraphernalia of hunting, fishing and camping—all of the luxuries and some of the necessities. I will not attempt to describe, or even to enumerate, the articles which comprised our outfit of prospective comfort and convenience. The entire list may be found, where we found it, in Halley's "Camp Guide for First Campers," a remarkable literary effort offering plentiful advice as to what to take on a camping trip, saying little or nothing as to how to make use of it.

On trotted the Parson's Morgan span. At midday no Canaanitish earmarks had been observed, so we revised our pre-conceived idea of Canaan and resolved to seek information at the next village. The next village proved to be a small and more or less scattered collection of farmhouses. The Parson lightly applied the whip and with a grand flourish the Morgan span swept into somebody's front yard. The Parson's "Whoa!" brought a woman in kitchen clothes out to the ivy-twined stoop. The Professor alighted, removed his hat and made his most graceful bow. Bingo leaped to the ground and emitted a few officious barks, as if he belonged to a committee of introduction.

"I beg your pardon," said the Professor, "but will you tell us if this is Canaan?" He spoke amicably, for the woman eyed him with sternness and suspicion. He paused for reply, which was made with great deliberation and obvious pity.

"Land sakes! no, this ain't Canaan. Canaan's 'most as big as Thomasville. I been there once. There's a store there and the Congo church. You can't miss it."

The Professor mopped his brow with his handkerchief, a white, linen handkerchief which the woman eyed with evident disfavor. The Professor ventured once more: "Would you mind if we had some water from the well?"

"Wall, no, it's free, the water is. But if you folks is dry I got some milk in the buttery."

This unexpected and generous invitation considerably relieved the tension. The Parson, Fritz and I alighted, and the four of us stood around and drank milk that would have been denominated cream on a menu card. The housewife poured from a big blue pitcher and the cup was passed from hand to hand. Meanwhile Bingo chased the hens.

"Who's goin' to pay for this here milk?" demanded the lady of the blue pitcher presently, and added, "The water's free as air."

The Parson, the Professor and Fritz looked first at the thrifty housewife, then at the ground, and then at me. I paid, after which I drew some water at the pump and gave it to Bingo.

Our hostess nervously offered a few more words of conversation as we departed.

"I—I see you got your fishal tackin'—tickle—fishin' tackle—with you. Goin' fishin', ain't ye?"

We answered "Yes" in chorus and said "Good-bye."

The Parson appeared troubled. "I hope she didn't think we were dead-beats," he said, and Fritz remarked, "I was just going to pay for the milk when she mentioned it."

Canaan we found an hour later. Canaan was our jumping-off place. It consisted mostly of a general store, meaning a department store, and a box-shaped wooden meeting-house, painted white but showing the marks of fifty years of New England weather. The Parson engaged a Canaanite to take care of the Morgans for a fortnight and gave detailed instructions as to the amount of hay and oats to put in their mangers. The Canaanite suggested a different ration, but the Parson only replied that he "would make an oat of it." The Professor, who was standing by, accused the Parson of having fetched his little joke too far.

After a lunch of crackers and cheese and canned goods on the veranda of the general store—all the natives came out to see us eat—we shouldered our packs and sallied boldly into the big woods. Bingo, like Satan, came also.

We followed an abandoned tote-road—terribly abandoned—for about seven miles. Our burdens became heavier than we could bear. The day grew dusky. We decided to go no further. We were too weary to erect a shelter according to Mr. Halley's specifications, and agreed with alacrity to sleep under the starry canopy of heaven. Alas, as shall be told, we did not fulfill the agreement—as to sleeping. Mr. Halley had written that a mossy slope would prove an excellent out-door bed, so we carefully selected such a spot in a grove of young evergreens. We opened our luggage and extracted the blankets and the food materials, then proceeded to get supper, a supper that was fearfully and wonderfully made.

First we built a campfire, or rather a bonfire. In our culinary operations we each assumed a professional air which would have accorded better with the professions which we pursued in non-vacation life; and each displayed a somewhat startling lack of adeptness in the art of woodland cookery. To make toast we tossed slices of bread into the coals and poked them out again with sticks. On the advice of Mr. Halley we had brought numerous pounds of salt-pork to be our mainstay of subsistence; and some of it we cooked by impaling chunks on spruce rods sharpened at the ends to serve as spits, and holding the meat in the midst of the flames. The Parson insisted on making the coffee. He set the pot in the center of the fire. The solder melted and the beverage vanished in steam. In the process of getting that supper we blackened our faces, scorched our skins, swallowed quantities of smoke, and damaged our tempers, but our appetites remained unimpaired. The dog refused to eat any of the salt-pork, so we fed him on doughnuts imported from Canaan.

After supper we piled more wood on the bonfire, spread the blankets on the mossy slope close by, lighted our pipes with brands snatched from the burning, sat down in positions suggestive of Romans, Turks and Indians, and talked awhile. The flickering firelight danced in and out among the shadows of the forest. Rabbits scampered near, emitting strange, squeaky noises. Now and then one of them would hop into view and as quickly hop out again. The dog, oppressed by the mystery of the forest-night, curled up against the Parson and moaned and whimpered. Presently Fritz startled us with a command for silence. "Sh!" he whispered, stage-fashion. "There's a rabbit on that knoll."

Sure enough, a dimly white shape of small proportions was to be seen moving slowly along the outer edge of the firelight. Fritz reached for a club and rose to his feet. The white object on the knoll had now become stationary. Fritz advanced cautiously, his heavy club raised. The club fell. Instantaneously a loud crash, as of a rifle volley, smote the stillness. The air became thick with broken glass and preserved prunes, whizzing toward all points of the compass.

"By the Great Horn Spoon!" ejaculated the Parson. "There goes my jar of prunes." The Parson was exceedingly fond of prunes.

Bingo had risen to his feet. He began to howl dismally, and the sound, mingled with shouts of laughter from the human contingent, echoed uncannily among the trees of the ancient forest. By-and-by we replenished the fire, rolled ourselves in our blankets, stretched wearily on the mossy bed, and fell asleep.

There is a limit to the softness of a bed of moss, and after a few hours we reached it. The moss, we learned, covered a rock with nubbins on it; and the nubbins, as time went on, emerged gradually but persistently from their secret places. To add to the horrors of the night, we found that our couch sloped down to a pool of water, the incline being sufficient to cause our bodies slowly but surely to demonstrate the infallibility of Newton's laws of gravitation. When we felt the water percolating among our toes we climbed back to our original position on the moss-covered rock. This

performance we repeated unanimously once an hour; and we were thus enabled to tell the time of night without referring to our watches. Finally sleep became impossible, as well as intolerable, and we devoted the remaining hours of the darkness to the employment of language suitable to our needs, and to counting the stars which shone peacefully through apertures of the forest roof. At dawn we rose as one man, stiff and sore, brushed all the dew of the spruces down our backs, concocted a breakfast which included salt-pork, and resumed the march.

Nothing else of note happened until two or three days later. We had ensconced ourselves as snugly as possible in a log cabin which had formerly been occupied by lumber-jacks. After a thorough housecleaning we had moved in. Several other decrepit shacks stood in the clearing, and one of these, which had been the cook-house under the régime of the lumbermen, contained, fortunately, a stove. A crystal stream flowed through the clearing, and trout could be angled for at our very doors. In the river we washed our dishes and our stockings.

Friday afternoon, having done up the camp work, we all went blue-berrying. Fritz led the way to a berry-patch which he had discovered half a mile from camp. The patch covered fifty acres of burnt woodland. At once we began filling with luscious spheres the tin tomato cans we carried. We looked forward, with appetizing thoughts, to a supper of berries, grateful for a variation from our palling diet of salt-pork. Trout had already given considerable relief, but we had not yet reached the point of deciding that it would be safe to throw away the numerous pounds of pork that still remained to us.

While we were busily engaged we were suddenly perturbed by a crashing among the bushes and the sound of a loud "Woof!" Bingo, tail lowered, ran to take refuge at the Parson's feet. Then a big black bear hove in sight, but to our infinite joy turned quickly in the opposite direction and galloped off. When we had somewhat recovered from our surprise and other emotions, Fritz remembered his gun, which was leaning against a nearby stump. Fortified by the gun, we lingered on the scene and filled our receptacles with berries. On our campward journey we stopped to drink at a woodland spring and detected in the ooze the footprints of a huge animal which might have been a bear. It is not too much to say that our minds became permeated with thoughts of bear. This fact is offered in partial extenuation of the subsequent events. The shadows were long when we arrived at the clearing. Fritz arrested our attention by pointing toward the bunk-house and commanding us to look. "What's that in the window?" he asked. "Doesn't it look like a bear?"

"I can discern what to my mind closely resembles the head of a bear," said the Professor.

"It moves!" exclaimed Fritz, apprehensively. "You take the gun—you're the best marksman here," and he handed the gun to me.

"Let's establish the facts first," urged the Parson, who was always something of a skeptic. "Let's all yell together, at the top of our lungs, so that if there is anybody in the house, he will know he is called for."

We followed the Parson's excellent advice and called lustily, but no response came, save the echoes. The black-and-white object in the window, however, moved perceptibly.

"See him wag his head!" said Fritz; and Fritz, being a cautious man, looked about him on all sides. Near by stood a rickety shanty—only a roof, supported by four posts which had long since abandoned all pretense of perpendicularity. Fritz climbed up. The Parson and the Professor did likewise. I was left on the earth with Bingo and the gun. Bingo whimpered and cowered underfoot, and the gun trembled.

"Shoot!" cried Fritz from his place of vantage on the roof. I aimed and fired.

"You hit him but didn't kill him," announced Fritz, when the smoke had been wafted away. "He's there yet."

I fired again. The object in the window scarcely stirred.

All of a sudden Fritz began to shout hilariously. He flung his arms aloft and began to dance a jig on the overburdened roof. The performance was too much for the props. Down came the shanty with a crash. The Parson, the Professor and Fritz extricated themselves with difficulty from the wreck, while I kept one eye on the window of the bunk-house. Fritz was still hilarious. "That's not a bear," said he. "It's my old white-toed stockings. I hung them in the window to dry."

The next evening we had a treat. Back at the general store in Canaan the Parson had surreptitiously purchased a dozen cigars, receiving no change for the half-dollar offered in payment. This supply of incense he had kept concealed about his person until Saturday evening, when, at the psychological moment, he produced it.

We were all puffing away bravely at our cigars when a knock sounded at the door. The Professor ushered in a stranger. Our visitor had come up from Canaan to ask the Parson if he would preach in the village church the next day. And the Parson acquiesced. The Canaanite accepted one of the Parson's cigars and proceeded to enjoy it, smoking all but the last quarter-inch.

It puzzled the Parson at first to know how his identity as a clergyman had been discovered. For myself, I have never seen anything in the Parson's garb or gait which would mark his profession. The visitor explained the mystery. The storekeeper of Canaan was also postmaster. His mail-bags had lately been wondrously heavy-laden, some of the letters bearing an unfamiliar name to which was prefixed the title of "Reverend." The postmaster, knowing that they were naturally eager to learn who had passed that way, had not withheld the information from his townspeople. The cracker-box logicians, who frequented the store of evenings, had decided, with the aid of great clouds of tobacco smoke, that "the fat, jolly man" of the party was the minister. This decision had resulted from the storekeeper's description of the secretive manner in which the Parson had made his purchase of cigars.

The little church in Canaan had been abandoned several years before, first by the congregation and then by the pastor, and the bell had hung silent for a long time. The fact that a clergyman was near at hand had been a suggestion, and everybody through the whole countryside has manifested a willingness, if not an ardent desire, to hear preaching again. Our guest imparted all these things to us as he smoked his cigar, and being urged, he bunked in the cabin over night.

Sunday morning, bright and early, we bestirred ourselves. The back-trail to Canaan was pleasant with the sunlight which streamed down through the tree-tops and with the music of the many birds in the leafy branches. The Parson preached the plain unvarnished gospel to a congregation which consisted of all the people of Canaan. His auditors showed their approval by sundry nods and winks. At the door, following the service, I overheard a remark: "Hell of a good sermon, wasn't it?" And some one answered that "It beat the devil." The Parson, as we were returning to camp in the afternoon, declared that he had never faced a congregation so inspiring—he had not felt that armor-plate encased the hearts of his hearers.

We stayed in the big woods another week. We followed many trails in those delightful days; we watched the swift and artful deer; we learned the wily ways of the speckled trout. We climbed hills and mountains. Our muscles hardened, and the blood rollicked through our veins. Of evenings we reveled in great freedom of talk and badinage, adding to our souls the fine experience of social relaxation. Since then we have gone together on similar expeditions.

Last Christmas the Professor sent me a book. On the fly-leaf he had written:

"One sometimes gets to thinking—especially by an open fire-place—that the hard miles and crooked trails have wrought in him more than sinew, and that, though he went forth for meat and muscle, the hills have bestowed on him in this subtle something a richer legacy."

RAYMOND G. FULLER.

Anglers Waiting.

NEW ORLEANS, La., Jan. 7.—*Editor Forest and Stream:* The fishermen are waiting for the cold weather to abate before attempting to land any of the finny tribe. It is expected that balmy days will come soon and then the rod men will get busy. A number of the members of the clubs on the Louisville and Nashville road and gulf coast will take advantage of the first favorable Saturdays and Sundays. It is expected that speckled trout will be biting well very soon.

F. G. G.

The Cheerful Catfish.

When de nights is warm an' de moon is full,
You kin ketch mo' cats dan you cares to pull.
No trouble 'bout de bait;
A grub 'll do or a li'l fat meat,
Fer all he wants is supp'n' to eat,
En he ain't no han' to wait.

Ner dar ain't no trouble 'bout luck wid him,
You kin tie yo' line to a swinging limb,
En when you goes to look
You'll fin' dat limb a-dodgin' 'roun'
En a catfish on yo' hook.

But I choose to take a pole in mine
En git a splotch er bright moonshine
En fish dar wid my han';
I knows, den, when 'e hits his lick
(He swallers de hook; you needn't be quick).
En I lets him show his man.

When I slings him out on de good dry grass
He don't complain, but he's full er sass.
He kicks a little while,
Den lays dar, wid a pleasing look,
En while I's rippin' out de hook
He takes it wid a smile.

—*Charlotte Observer.*

"Well, Sir! Once—."

II.

"Well, sir, there was a time when I wanted to go fishing every time I saw a bucket of water," said a man one day, stopping to admire my fish, "but now I like to spend my vacations loafing around the water watching other people. Did you ever realize what an unusually fine field for the study of human nature is to be found in a congregation of fishermen? The absorbing nature of the sport leaves few opportunities to play combinations, and the real colors show out strong. Let me spend an hour or two with men when the fish are biting—or not a thing doing; when bait is scarce and hooks are lost; when lines tangle and particular locations are evidently much desired, and at the end of the session I will pick the men from the crowd. I'll divide them as quickly and surely as the new separator will divide the cream from the blue john in a gallon of milk. Been down here only an hour this morning and have already found a half dozen genuine and half as many paste jewels. Worst I ever saw up the dock there just now. Man, at least a biped, fishing with his wife. She asked him to bait her hook. He growled, 'Wait,' and sat there twenty minutes catching fish, while she sat waiting and wistfully looking on. That kind of a fellow makes me hate civilization, and wish times were back in the primitive when might made right. I should greatly enjoy seeing how far I could throw him out into the water, and how often I could beat him back when he tried to climb out without really ending his selfish career."

"Awful thing happened over on the west coast where I have been fishing," said a man who had come up. "A peddler traveling through the country with his pack came to a deep creek and found the only boat there on the other side. He looked up an old man living near and asked him to put him across, but the old man told him he would have to wait until someone came along from the other side and brought the boat over. The peddler was in a hurry and finally offered the old man a dollar to swim over and get the boat. The man refused, saying there was a big alligator in the creek, and it was almost sure to attack anyone trying to swim the stream there. After waiting some time the peddler became impatient, pulled off his clothes and started to swim after the boat himself. Half across he was attacked by the alligator, which pulled him under and devoured him. The old man said he would get the alligator if he had to watch a month. He made a blind on the bank, and on the second day saw the big fellow come to the top. Being a good shot, he put a bullet in its eye, and getting help, pulled it out with grab hooks. Once on the bank they cut it open to make sure it was the man killer, and in its stomach found the buttons from the peddler's clothes."

The man passed on. "Didn't you understand that fellow to say the peddler pulled off his clothes before he started to swim the stream?" said the man who had first approached, and who had remained listening to the story.

"Yes, that is certainly what he said."

"Well," said he, after reflecting a moment, "had the peddler been reduced to a diet of buttons, or did the wily saurian go out on the bank and eat up his clothes to destroy the traces of his crime? I hold to the latter theory against all odds."

Lewis Hopkins.

An Angler with Nimble Feet.

The piscatorial event of the week has been the capture by Mr. Kennard of a 49½-pound "salmon" in the bay. As everyone knows, this angler has lost both his arms, and the feat of successfully playing a bender of this caliber and bringing it to gaff despite such a physical handicap is a notable one. Mr. Kennard uses a light rod, which he manages entirely without help, and I have often seen him playing a fish in a manner which no expert could find fault with. My hearty congratulations to the veteran, and may his fish prove a pennant winner!—"John Dory" in the Durban Pictorial.

Some News and a Little Gossip.

Eastward is to be the name of the new schooner building at Herreshoff's for Morton F. Plant. Mr. Cochran's yacht is Westward, and it is expected that she will return to this side to race against Eastward. The meeting of two crack vessels so named may rather complicate the reports of the race. It will seem odd to read, "The Westward stood on the port tack to the eastward, while the Eastward held the starboard tack to the westward." The Herreshoffs intend to launch the new yacht on April 24, which will be the 70th birthday of John B. Herreshoff, the head of the firm. This will be a most fitting way to celebrate such a day at Bristol.

Yachtsmen are speculating on the relative merits of the two yachts. Some think that the centerboard in the new craft will not be of much advantage to her, especially as the Westward draws about 17 feet, which is rather more than allowed a vessel of her size according to the American rule. She will be penalized a little for this excess of draft, but it is possible that it may be offset in some other way, just how will be known when the measurer puts his tape over the two yachts.

A writer from Bristol, commenting on the two schooners, says:

"Late advices from England confirm the report of a few weeks ago that the racing and cruising schooner yacht Westward, owned by Alexander S. Cochran, N. Y. Y. C., will positively return to America in the spring in charge of Capt. Charles Barr. And it is also positive that she will be raced in home waters next season under the flag of Mr. Cochran and with Capt. Barr in command.

"It looks in Bristol just at present as if Capt. Barr will face a dangerous man and a dangerous boat next season. It is believed in a general way by racing men that the newest Herreshoff design in large schooners will be more than the equal in speed of the Westward, but how much more can be determined only when the pair come together at some of the racing lines along the Atlantic coast. That there will be most exciting sport in B class of schooners next summer, in which these two speedy craft will race, is accepted without any argument. Westward, sailed by Capt. Barr last summer over some of the most famous courses on the coast of the European continent, carried her owner's flag to victory in twenty-three out of the twenty-four contests and at present is considered the fastest two-sticker in the larger class afloat.

"On the other hand, Capt. Dennis has been in the racing game for thirty years and has handled all sorts of sailing craft. He is a resident of Long Island, and has the habit occasionally of departing from the racing fleet when on a run and emerging with his charge, carrying a reaching wind and bowling past his contestants as if many of them were at anchor. His feat of winning the Astor cup for schooners with the Elmina last August off Newport was a feat to be remembered. In a stiff wind he led the fleet around the Hen and Chickens Lightship and return to Brenton's Reef, logging at the rate of 12 miles an hour.

"It is a known fact in Bristol that instead of Alexander S. Cochran bargaining to sell the Westward in England he has made all arrangements for having the racer brought from Southampton to the United States next spring, and it is now likely from what has been disclosed that the Westward will be seen at Bristol next May, taking her turn in the fitting out operation at Herreshoff's. It is settled that Mr. Cochran means to race his craft next season here.

"Another big schooner that will cast her mudhook at Bristol next spring and will probably be there about the time of the launching of Eastward is Queen, built a few years ago for J. Rogers Maxwell at Herreshoff's, and recently given in exchange to Commodore E. Walter Clark, of Philadelphia, for the schooner Irolita, also a Herreshoff designed and built schooner, though of smaller dimensions that Queen.

The members of the Pavonia Y. C. have succeeded in getting a rather dangerous obstruction in New York Harbor marked by a buoy. Within a few hundred feet of Robbin's Reef Lighthouse there is a pile of rock which just protrudes at low tide and forms an extremely dangerous obstruction to navigation. It was originally a cribwork filled with rock, but the spiling and cribbing have rotted away, leaving the rock.

While this obstruction lies to the west of the light and is therefore out of the channel and away from the larger portion of the traffic, yet there is sufficient water for a long distance inside of it, and many tugs with their tows, small freight steamers and other commercial as well as hundreds of pleasure boats pass within a few feet of this point in order to keep out of the strong tides which they would find outside of the light on their way up or down the bay. Only a short distance to the southward of this point is an anchorage where many large vessels wait for docking.

Besides the large number of craft thus en-

dangered there is an anchorage to the west and in that part of New York Bay which is adjacent to Bayonne, where several hundred yachts and pleasure boats are annually moored, and forms the outlet for all those who enjoy outings on the water, and who reside in Bayonne, Jersey City, Hoboken and points far to the northward and also the westward as far as the Oranges. Many even who live in the greater city of New York have found this the most accessible as well as the safest place to leave their boats.

A number of boats had hit this obstruction and been damaged to a greater or less extent, so that some time ago the Pavonia Y. C. of Bayonne, which uses a portion of this westward part of the bay, came to the conclusion that the Government ought to erect and maintain a beacon or mark of some nature over the rocks, and accordingly brought this matter to the attention of their Congressman, the Hon. E. P. Kinkead. He went before the lighthouse board and has succeeded in having the board establish the Pavonia Crib Beacon as a permanent mark.

Three prominent yacht clubs held annual meetings last Wednesday and officers and committees were elected at each. The Seawanhaka-Corinthian Y. C. Members dined at the New York Club and later attended to business with the result that these officers were elected: Commodore, Frank S. Hastings, ketch Peggy; Vice-Commodore, Edward F. Whitney, steamer Arrow; Rear-Commodore, Daniel Bacon, sloop Avenger; Secretary, Everett Dominick; Treasurer, Colgate Hoyt, Jr.; Measurer, C. Sherman Hoyt; Trustees (class of 1914)—James A. Blair, Jr., Alfred Ely, Beverly R. Robinson. Franklin A. Plummer was chairman of the nominating committee.

The meeting of the Bensonhurst Y. C. was held in the Clarendon Hotel, Brooklyn and the following officers and committees were elected: Commodore, G. R. Le Sauvage, sloop Joy; Vice-Commodore, Samuel Cochrane, motor boat Eronel; Rear-Commodore, Dr. C. L. Atkinson, sloop Althea; Secretary, W. W. W. Roberts; Treasurer, F. L. Billingham; Measurer, Alfred Mackay. Regatta Committee—H. L. Leggatt, Chairman; J. Wunder, H. T. Lane, J. F. Doutney, J. W. Cherrie. Nominating Committee—W. L. Inslee, Chairman; C. H. Clayton, M. B. Hoffman, C. H. MacKrell, H. D. Scribner. Auditing Committee—A. H. Hawkins, W. R. Sainsbury, J. F. Doutney. Executive Board—C. H. Clayton, R. W. Rummell, J. L. Mitchell, H. A. Robbins, A. H. Hawkins, M. B. Hoffman, R. B. Moore, G. B. Waters, F. R. Smyth, John Brown. Board of Directors—A. V. Finn, W. A. Collins, E. Zimmerman. Delegates Y. R. A. G. B.—H. L. Leggatt, W. L. Inslee. Delegates A. P. B. A.—Walter M. Bieling, F. R. Smyth.

The meeting of the Corinthian Y. C. of Marblehead was held in Boston, and the officers elected were: Commodore, Charles B. Wheelock; Vice-Commodore, William P. Wharton; Rear-Commodore, John B. Fallon; Secretary, Herbert S. Goodwin; Treasurer, Fred W. Moore; Executive Committee—Arthur K. Simpson and Frederick P. Bowden; Membership Committee—Percival Pope, Merrill Hunt, Samuel W. Lewis and Harold Peters; Regatta Committee—William L. Carleton, Lawrence F. Percival, George Upton, George H. Mayo and Leonard M. Fowle; House Committee—Pierce L. Fish.

Commodore Wheelock owns the 31-rater Amoret, and is an enthusiastic racing man.

The Manhasset Bay Y. C., at its annual meeting last Tuesday, elected the following officers: Commodore, John F. O'Rourke; Vice-Commodore Clarkson Cowl; Rear-Commodore, E. A. Sierck; Secretary, B. G. Loomis; Treasurer, E. J. West; Measurer, William Gardner; Trustees (class 1912)—A. H. Alker and Robert B. Sizer.

The newly elected officers of the Philadelphia Y. C. are: Commodore, S. B. S. Barth; Vice-Commodore, J. H. Johnson; Rear-Commodore, George S. Schilling; Recording Secretary, S. W. Bookhammer; Financial Secretary, C. Carroll Cook; Field Surgeon, Dr. F. J. Haerer; Harbor Master, Barnard Bloch; Measurer, Alexander G. Rea; Trustees, J. H. Bromley, W. A. Christy, A. English, G. W. Fite, J. H. Simon, W. N. Stevenson, R. J. Williams.

The Chesapeake Bay Y. C. has purchased a three-story brick building at Easton, which was formerly the residence of the late Gen. Richard Thomas. It contains fifteen bedrooms and other apartments, and is well suited for club purposes. It has been thoroughly overhauled, and when opened, will make one of the best club houses on Chesapeake Bay.

The Boston Y. C. has challenged the Quincy Y. C. for a race for the Quincy cup, which was won last year by the Sonder boat Harpoon, owned and sailed by Charles Francis Adams 2d. The challenger named is the Ellen II., a new Sonder boat now building for Charles P. Curtis. Besides the Boston Y. C. it is expected that the Eastern Corinthian of Marblehead, Manchester, Hingham, Beverly and Sippican Y. C. will have starters in this series of races. Several new Sonders are being built and this series will bring together the best of the fleet. The races will be sailed in Hingham Bay, starting off Hough's Neck.

New Yachts for Cruising or Racing.

BOWES & MOWER, the Philadelphia naval architects, are very busy with new work for the coming season, and have on hand orders for many different types of racing and cruising boats.

The largest vessel for which an order has been received is a three-masted schooner of 275 gross tons for Dr. Wilfred T. Grenfell, for service in connection with the Labrador Mission. This vessel will be about 150 feet long, 28 feet beam and 12 feet mean draft. She will be a working vessel designed to carry freight, but is designed to be much faster than a regular working schooner and will have somewhat the appearance of a yacht with a handsome clipper bow and an overhang stern. She will be equipped with auxiliary power sufficient to give a speed of six knots. She will be built of wood and in accordance with the requirements of the American Bureau of Shipping.

Plans are being prepared for a 125-foot cruising power yacht for a member of the New York Y. C. She will be built of steel and will have unusually fine accommodations and will be equipped with every modern and up-to-date detail for comfort of her owner.

Orders have been received from Philadelphia yachtsmen for a 65-footer, a 50-footer, two 45-footers and a 40-footer of the famous Ilys type designed by Mr. Bowes, which combines comfort with speed and seaworthiness necessary for long distance ocean racing.

A shoal draft auxiliary schooner, 78 feet over all, 60 feet waterline has been ordered by a San Francisco yachtsman, and the contract will be placed with the Salisbury Marine Construction Co. She will be a sea-going type similar to the Atlantic City fishermen with a pole-masted rig and will have a 40-horsepower Murray & Tregurtha engine for auxiliary power.

For the racing classes a Class Q boat has been designed and is now building by Sheppard at Essington, Pa.

A new Sonder boat has been designed for Herbert M. Sears, of Boston, and the contract for building has been placed with the Fenton Company, of Manchester, Mass. In design she is an improved Cima, a boat of Mr. Mower's design, which was one of the boats chosen to sail on the American team against the Spanish boats at Marblehead last season and also selected as one of the three boats to go to Kiel next June to race against the Germans.

A new 18-footer has been designed for Harvey J. Flint, of Providence, and is now building by the Narragansett Yacht Yard.

A boat to compete for the Taft cup at Toledo is being designed, and she will be an improved Possum, the winning boat of 1909.

For Lake Ontario a Class R sloop has been ordered by a syndicate of the Crescent Y. C., of Watertown, N. Y.

A 35-foot day service launch has been designed for E. E. Sargent, of Newark, N. J., for use on Lake Hopatcong, and orders have been received for five 28-foot runabout launches similar to the Thousand Islands one design class built last year from Mower designs.

An auxiliary sloop of 22 feet waterline has been designed for a Vancouver yachtsman, and a 25-foot waterline auxiliary yawl for a New York owner. A large auxiliary party boat with knockabout rig has been designed for Herbert Smith, of Ocean City, N. J., and a 30-foot raised deck auxiliary cruising knockabout has been ordered by C. T. Schaefer, of Germantown.

Yachting on the Chesapeake.

REAR-COMMODORE GRAHAM ECKEL, of the Corinthian Y. C., of Baltimore, has written very interestingly of the sport on Chesapeake Bay. He tells what was done last year and what the yachtsmen of those waters are aiming to do this year. There is lots of yachting on Chesapeake Bay, lots of racing in many classes, and it is an ideal cruising ground. Some yachtsmen who are wishing for other fields might do well to pay a visit to Chesapeake Bay during the season, which opens early and closes late. Commodore Eckel says:

"The yachting season of 1910 on Chesapeake Bay was a remarkably good one in several ways. The weather during the months of July, August and September was ideal for the sport—fair weather, plenty of wind, few squalls. This was very encouraging to the owners of craft of all descriptions. Then the formation of the 'Yacht Racing Association of Chesapeake Bay' gave this delightful sport an impetus which it greatly needed. The organization of two new motor yacht clubs in Baltimore also had its effect in increasing the number of enthusiasts afloat. The rapidly increasing number of power craft on the Patapsco and other tributaries of the upper Chesapeake is a very good indication of the increased interest that is being manifested in yachting, and especially of the desire to know more of the beauties of the waters of the Chesapeake and its tributaries.

"The people of this city are not alive to the fact that in the Chesapeake Bay, its rivers, creeks and inlets, they have the finest body of water for yachting, especially in small craft, that is to be found in this country. Beginning at the head of the bay with the beautiful Susquehanna, with its high banks and rolling hills, down to Eastern Shore, we find the Northeast and Elk rivers, with Bohemia Creek, where is located the well-known Bohemia Manor; the Sassafras, with Worton and Fairlee creeks, and the noble Chester River and Corsica Creek.

"Further south we find Eastern Bay, with lovely Miles and Wye rivers. On the western shore are the Bush, Gunpowder, Middle and Back rivers, and the Patapsco, well named as the river of White Caps. The picturesque Magothy is the next river that entices the lover of nature, with its islands—Gibsons, Dutch Ship and Round Island. The Severn, with the State capital, Annapolis, at its mouth, is better known probably than any of the others, and many Baltimoreans are establishing summer homes on its beautiful banks; a great many are also locating on the Magothy.

"All of these sheets of water are within 50 miles of Baltimore and accessible to cabin motor boats, and many of them to boats of almost any size. Each has a beauty all its own, and the writer has not the ability to fitly describe them. To those who do not wish to travel so far, the creeks tributary to the Patapsco offer scenic inducements that are worth while. Curtis Creek, with its lovely coves, and Furnace Branch, with the ruins of the old iron furnace where they made cannon during the Revolutionary War; Stony Creek, with its rolling hills; Rock Creek, Bodkin Creek and

its snug hiding places; Bear Creek and Old Roads Bay are within 10 miles of Fort McHenry and can be reached even in an open boat.

"The Baltimore Y. C. is the oldest yachting organization here, being now, I believe, in its twenty-first year. During the last year its members have done considerable racing, and the social functions have been well attended. The opening races on May 30 were hotly contested. The Fourth of July races were spoiled by lack of wind, but this did not prevent them from winning the joint contest with the Corinthian Y. C. for a handsome silver cup.

"The Corinthian Y. C., which, though smaller, keeps pace with the Baltimore Y. C. in the number of sailing craft and the enthusiasm of its sailors, is now in its eighteenth year. It had a very successful season, beginning with the opening and club races on May 30, which were full of excitement. On July 4, the club had its annual cruise and races, together with a joint race with the Baltimore Y. C., losing the latter. On Labor Day it held a very enjoyable club cruise to Magothy River, with a race home for a silver cup, offered by Commodore J. H. Robinette.

"The Maryland Motor Boat Club had races as a card for its opening day, and its pretty club house was thronged with visitors. The fleet of this club now contains some very fine motor yachts, which are often met at various points on the bay during the summer.

"The Baltimore Motor Yacht Club has also had a successful season. Its opening day regatta was well attended, and its motor boat races on Defenders' Day was better contested and handled than any such races during the season.

"The joint cruise and races held by the Yacht Racing Association of Chesapeake Bay the week of July 16 was a most successful and interesting event. The rendezvous was at Solomon's Island in the Patuxent. Unfortunately, a strong northeast wind prevented a great many of the sailing craft from reaching this point, but those that did raced gamely to Oxford, where the full fleet had assembled. The harbor was alive with craft of all description, from canoes to three-masted schooner yachts, and the marine picture presented was a most beautiful one.

"The reception given by Commodore Goldsborough at his handsome home on Trippe Creek, on behalf of the Chesapeake Bay Y. C., was very much enjoyed, and was an opportunity for the yachtsmen from the various clubs to get together. The races at Oxford were very good and the race from Oxford to Annapolis, by the whole sailing fleet, was fine. The races held the following day off Annapolis were also fought. The advent of the fast racing sloops Eleanor and Vingtrois lent a new interest to the sailing races this season, and it is hoped that some more of this class may be added to the fleets next year.

"Two or three new boats are needed in the T Class of sloops to compete with Ojigwan and Englet. The P Class is too small to make the racing very keen. The popular yawls will have some additions, and this class should furnish good sport. The officers and executive committee of the Racing Association are to be congratulated on the good showing made in its initial year, and it is to be hoped that their efforts will be rewarded by larger entries in all classes."

Preparing for a Long Voyage.

New Orleans, Jan. 7.—*Editor Forest and Stream:* Adolph L. Frietsch, a well known navigator, is here in his schooner Forward, in the new Basin Canal, preparing his plans for the Wanderlust, which he will have built. This boat will be a schooner of 40 feet in length and five tons. He proposes to sail practically around the world without any companion. Captain Frietsch has lived on the sea for many years. His daughter, Miss Charlotte, accompanied him on several of his voyages. His son resides here. Captain Frietsch was born in Sweden, although his home is in Australia.

Scooters for South Bay.

Members of the Islip Y. C. are turning attention to scootering. They have formed the Islip Scooter Club, and sixteen boats have been built by Fred O. Smith, of Bayport. It is a one-design class and will be known as the "Duck Class," because each scooter will carry on its sail a duck and will be named after a duck. Each boat also has its own particular color. The names and colors of the boats and their owners are:

Butterball, combing maroon, deck scarlet, sides maroon, bottom scarlet, runners maroon; August Belmont.

Pintail, same colorings, but oppositely arranged; August Belmont, Jr.

Whistler, perpendicular hoops of yellow and white, one foot wide; deck and combing light blue; Raymond Duval.

Mallard, deck slate color, sides mallard gray, bottom white; Lewis M. Gibb.

Redhead, all red; S. A. Walsh, Jr.

Ruddyduck, perpendicular hoops of blue and white a foot wide; Allan Pinkerton.

Greenwing, deck green, sides white, bottom green; Buel Hollister.

Broadbill, all yellow; Aymar Johnson.

Bluewing, deck gray, sides light blue, bottom white; Harold Weeks.

Shellpeg, top and sides natural wood, bottom white; John M. Knapp and Samuel Cushing.

Blackduck, H. B. Hollins, Jr.; Widgeon, Rockhill B. Potts; Slipper, George A. Ellis, Jr., and Woodduck, E. F. Hutton, are all white. Horace Havemeyer's scooter has not yet been named.

Motor Boating.

Cruiser for M. H. Alworth.

A cruising motor yacht of more than ordinary interest to all lovers of the game, especially those interested in a boat for offshore cruising, as well as for use on more protected waters, is the big power boat now under construction in the yard of a prominent builder at Muskegon, Michigan, for M. H. Alworth, of Duluth, Minn. It is the intention of the owner to take the boat, when completed, to Florida waters by way of the Mississippi River.

The general dimensions of the boat are: Length over all, 96 feet 4 inches; beam, 16 feet 6 inches; draft, 3 feet 6 inches. The construction is the very best, no expense being spared to produce a boat that will stand extremely hard service, and be good to look at and live in as well.

All interior woodwork is of selected African mahogany, and the interior work, with the exception of the galley, quarters for the crew and engine room, will be mahogany and white enamel. The galley and crew's quarters are finished in V-jointed southern pine and the engine compartments in selected quartered white oak. A unique feature will be that the decks are left almost entirely clear, with the exception of two small companionways, aside from the main saloon and pilot house which will occupy a position amidships, affording an unbroken view on all sides. Surmounting this is the observation deck and steering bridge. Awnings will cover the observation deck and the main deck forward and aft of the pilot house, affording plenty of cool shady deck space, where the owner and his guests can enjoy life. The yacht carries a power tender in davits on her starboard quarter and a rowing dinghy in a similar position to port. The forecastle will have berths and lockers for four men with a complete toilet and bath room. Next to these are two staterooms with upper and lower berths for engineer and officers. Aft of these will be the engine room and fuel tank space, the boat being powered with two 6-cylinder 100-horsepower engines, air starting and reversing, driving twin screws, with a separate gasolene engine to generate electricity for the lighting of the entire boat, including sailing lights and searchlights. Aft of the engine, and completely isolated by watertight bulkheads, is a fuel tank 54 inches in diameter, extending nearly the full width of the ship, and with a capacity of 1,400 gallons. Aft of this will be carried 600 gallons of water and 2,000 pounds of ice. Next comes the galley, floored with concrete, with range, hot water heater for steam heating plant, sink and every modern culinary convenience.

A wide passage leads aft to the owner's and guests' staterooms. There are three guests' staterooms, all equipped with lavatories, hot and cold water, lockers, cushion seats, and open into a starboard bathroom, as well as an extra toilet room at the foot of the stairs.

The owner's stateroom extends the full width of the boat, and has a large double berth and upholstered divan and seat, with roomy lockers and cabinets.

All doors, windows and ports are fitted with the best of plate glass and equipped with bronze mesh screens. The upholstery, carpets, and all materials for decorations are selected to harmonize with the woodwork and will provide a pleasing effect. Mr. Alworth intends to spend the entire winter in short cruises among the Florida and Gulf ports.

A New Itaska Ordered.

E. B. Hawkins, who formerly owned the cruising motor boat Itaska, and who in that yacht cruised along the Atlantic coast, in southern waters and on the Lakes, is having a new craft built from designs by Whittelsey & Whittelsey by the Hudson Yacht and Boat Company at Nyack. This yacht is to be 98 feet long. There will be a large deck house forward which will contain the dining room, and over this will be the bridge from which the yacht will be handled. There will be a dummy stack for ventilating purposes and one spar on which will be carried a crossyard for signalling.

Aft of the stack to the taffrail will be clear deck space for the use of the owner and his guests. The owner's stateroom will be amidships with a bathroom attached on the port side. Aft of this stateroom on the port side will be a guests' room and on the opposite side a companionway which will lead to the deck. Further aft will be more staterooms.

The yacht is to be driven by two 100-horsepower air reversing Standard motors, which will drive her 15 miles an hour. An auxiliary motor will drive the air compressor, dynamo and bilge pump. The gasolene tanks are to be amidships. These will have a capacity of 2,000 gallons. The keel of the yacht, the frames and deck beams are of white oak, the deck will be of white pine and the plankshear, waterways, etc., of mahogany. The interior fietings of the owner's quarters aft are also of mahogany. This craft will have six watertight compartments and is to be ready in the spring.

Motor Boat Show.

The National Motor Boat Show will be held in Madison Square Garden from Feb. 21 to March 5, and it is expected to be better than any previous exhibition of the Association of Engine and Boat Builders. There will be over 300 exhibitors of motor boats, engines and accessories. New York in the past has led the world in the exhibition of motor boats, and this year's show will surpass anything heretofore.

High speed launches which can make 35 miles an hour will be shown that are not racing machines but pleasure boats, affording comfortable seating appointments, maximum safety and seaworthiness. Cruising yachts will be exhibited capable of accommodating a party of ten or twelve. These boats have become most popular for off shore cruising and for extended trips on rivers and canals. Few realize the many delightful trips that can be taken in a cruising motor boat, a boat of this size being easily managed by one man.

Engines varying from the smallest ½-horsepower two-cycle motors, to 300-horsepower slow speed yacht engines will be exhibited, together with high speed motors capable of delivering an enormous amount of power from

the minimum weight. In many ways the marine engine has been developed to a higher state of perfection than the automobile motor, as in the marine engine the maximum power is required continuously, the driving of a motor boat being uphill work all the time in comparison with a motor car.

Accessories will be exhibited, including different makes of propellers, reverse gears, engine carbureters, boat hardware and electric ignition outfits and electric lighting plants. The exhibit will interest all motor boat enthusiasts and yachtsmen who visit the show and will be largely attended by people from cities outside of New York, it being the only motor boat show held in New York city.

The show will be held under the auspices of the National Association of Engine and Boat Manufacturers, the association comprising all the leading boat and engine building and accessory manufacturers. Among the special features will be the Government exhibition of power life saving boats, which will be under the supervision of Capt. McClelland, supervisor of Long Island stations, and a detail of life savers. The exhibit will include the largest power life boat in the world.

The Thousand Islands Y. C. will exhibit one of its famous 28-foot power boats, while the Richelieu and Ontario Navigation Company will show the steamer Rapids King, which negotiates the dangerous St. Lawrence rapids.

The Curtiss aeroplanes will be exhibited in the concert hall and demonstrations given every afternoon and evening. In addition to a series of lectures by an expert, Glenn H. Curtiss will be on hand during the show to explain the science of aeronautics. In the basement 1,600 boys will compete on sixteen ranges for the Public Schools Athletic League rifle shooting championships.

Inventor of Barometer.

TORRICELLI invented the barometer in the seventeenth century. It was a tube of mercury then; in many cases it is a tube of mercury still. The tube is a yard long and about half an inch in diameter. It is open at one end and closed at the other, and is partly filled with mercury. The open end dips into a little trough of mercury or is bent slightly upward in the form of a tiny cup. The top of the mercury column is exposed to view and by means of a scale alongside of the column its height is read off. These are the essentials in the construction of the ordinary instrument, says the Marine Journal.

What is known as the wheel barometer, so often met within houses, is an ingenious variation of Torricelli's idea. This barometer was invented by Robert Hooke, probably the greatest philosophical mechanic of his day. It is intended to indicate the weather without observing the mercury itself. There is the usual tube, but bent at the bottom into a short leg. In this leg a little glass float rests upon the surface of the mercury. A cord attached to the float passes over a pulley. The pulley is furnished with a pointer which moves round the dial, the moving agency being the rising or falling mercury, which lifts or lowers the float.

As regards modern barometers, everybody is familiar with the aneroid—a very beautiful portable and accurate instrument independent of a column of mercury, and the danger to which it is liable from spilling. The aneroid consists of a metal box partly filled with air. One face of the box is corrugated and so thin that it yields to the variations of the atmospheric pressure. Then there is the self registering barometer, which writes its record on paper wound on a drum. The drum revolves by clockwork. A pencil connected with the barometer presses upon the revolving paper and rises and falls with the mercury. When the mercury falls the line drawn by the pencil slopes down; when it rises the line slopes up.

The FOREST AND STREAM *may be obtained from any newsdealer on order. Ask your dealer to supply you regularly.*

Gas Producer Plants.

CHARLES B. PAGE, at the recent meeting of the Society of Naval Architects and Marine Engineers, read the following paper on, "Two Marine Installations of Producer Gas":

Last year, the members of the Society had the pleasure of listening to an article on "The Producer Gas Boat Marenging," by Mr. H. L. Aldrich. The profession as well as vessel owners are deeply indebted to Mr. Aldrich for taking the first step toward what must shortly be a very extended use of producer gas power on shipboard.

While the Marenging was but forty feet in length and powered with a 25-horse plant, the practicability of marine producer gas power was amply demonstrated at least for small powers. The next boat to be fitted with producer gas was the auxiliary Geodetic Survey yacht Carnegie. The power plant consisted of a 150-horsepower anthracite coal producer and a four-cylinder, four-cycle, regular type marine engine adapted to the use of producer gas by enlarged inlet and exhaust valves and passages and increased compression. Both producer and engine were constructed largely of non-magnetic materials and were especially notable because of this fact. The Carnegie has been in commission since the summer of 1909, has made one round trip across the Atlantic, is now in the southern hemisphere, and is expected shortly to go to Australia.

The next installations of marine gas power, so far as I am informed, were made in the power boat Mary A. Sharp, operating on Chesapeake Bay and tributaries, and the Superior, of Bayfield, Wisconsin. These two boats are the first commercial craft, certainly of any size, in America to be powered with producer gas.

Their principal dimensions are as follows:

MARY A. SHARP.

Length over all	66ft.
Beam	14ft. 6in.
Depth of hold	5ft. 3in.
Producer—	
Height	6ft. 10in.
Diameter of shell	4ft.
Engine, three-cylinder	75 B.H.P.
Bore	9in.
Stroke	12in.
Air starting and reversing and direct connection to propeller shaft.	
Propeller, 3-blade—	
Diameter	44in.
Pitch	56in.

SUPERIOR.

Length over all	65ft.
Beam	12ft. 9in.
Depth of hold	4ft.
Producer—	
Diameter of shell	3ft. 6in.
Height	6ft. 6in.
Engine, two-cylinder	50 B.H.P.
Bore	9in.
Stroke	12in.
Air starting, fitted with reverse gear.	
Propeller, 3-blade—	
Diameter	40in.
Pitch	54in.

The same general description will cover the interesting points of the power equipment of both boats. The producers used in both installations are the same type and make as fitted in the Marenging and Carnegie. The producer is a cylindrical steel shell lined with asbestos and fire-brick to such thickness that, when running at full load, the heat radiation is not important. While the shell is rather warm to the touch, it cannot be regarded as hot. With proper ventilation this heat in summer is not objectionable, while it is most agreeable in other seasons of the year. The whole principle being one of suction or vacuum, there is no escape of gas into the boat. The writer has been aboard the Mary A. Sharp after she had been closed up for a week, excepting about half an hour ever other day, when a little additional draft was given to the producer to keep

Canoe Handling and Sailing.
The Canoe: History, Uses, Limitations and Varieties, Practical Management and Care, and Relative Facts. By C. Bowyer Vaux ("Dot"). Illustrated. Cloth, 163 pages. Price, $1.00. New and revised edition, with additional matter.
A complete manual for the management of the canoe. Everything is made intelligible to the veriest novice, and Mr. Vaux proves himself one of those successful instructors who communicate their own enthusiasm to their pupils.
FOREST AND STREAM PUBLISHING CO.

My Friend The Partridge.
S. T. Hammond. A delightful reminder of crisp autumnal days in the covers. It tells of sport with the noblest of game birds, the habits and habitat of the ruffed grouse, with just the right touch of reminiscence and personal experience. Cloth. Illustrated, 150 pages. Postpaid, $1.00.
FOREST AND STREAM PUBLISHING CO.

FOREST AND STREAM
A JOURNAL OF OUTDOOR LIFE
TRAVEL, NATURE STUDY, SHOOTING, FISHING, YACHTING

CORRESPONDENCE.
The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. The editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.
Subscriptions may begin at any time. Terms: For single copies, $3.00 per year; $1.50 for six months. Rates for clubs of annual subscribers:
Three Copies, $7.50. Five Copies, $12.
Remit by express money-order, registered letter, money-order or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canada and Great Britain. Canadian subscriptions, $4.00 a year, $2.00 for six months.
Foreign Subscriptions and Sales Agents—London: Davies & Co., 1 Finch Lane; Sampson, Low & Co. Paris: Brentano's. Foreign terms: $4.50 per year; $2.25 for six months.

ADVERTISEMENTS.
Inside pages, 16 cents per agate line. Special rates for three, six and twelve months. Eight words to the line, fourteen lines to one inch. Advertisements should be received by Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money, or they will not be inserted. Reading notices, seventy-five cents per line. Only advertisements of an approved character inserted.

Display Classified Advertising.
Hotels, Summer and Winter Resorts, Instruction, Schools, Colleges, etc. Railroad and Steamship Time Tables. Real Estate For Sale and To Let. Seeds and Shrubs, Taxidermists. The Kennel. Dogs, etc. Wants and Exchanges. Per agate line, per insertion, 13 cents. Three months and over, 10 cents per line.

Solid Classified Advertising.
For Sale. Kennel. Property For Sale. Real Estate For Sale or To Let. Wants and Exchanges. Per agate line, 10 cents. Absolutely no display. No advertisement of less than three lines accepted. Cash must in every case accompany order.

FOREST AND STREAM PUB. CO.
127 Franklin St., New York.

the fire alive, and found no odor of gas in the engine room. At a suitable distance above the bottom to form an ash-pit is located the gate and on a line with this are two fire doors for slicing the fire and raking off the ashes. An ash-pit door is fitted for the removal of ashes and clinkers. The coal is fed into the producer through a hopper on top and just below, reaching into the center, is the gas take-off pipe. The side walls of fire-brick are substantially vertical and we have then a fire-brick lined cylinder filled with anthracite pea coal in various stages of combustion. While operating, the hottest fire zone is from six to eighteen inches above the grate. Above this is a red hot and black hot layer of coal extending up to the take-off pipe. The top of the producer is effectively insulated by a considerable layer of coal around and above the take-off pipe. Thus it will appear that the producer itself is extremely simple.

Contrary to general land practice there is no water vaporizer whose function is to generate steam vapor which, mixed with the air and passed through the fire, serves the double purpose of enriching the gas (the steam forming water gas) and softening the clinker. A number of attempts have been made to incorporate this device with marine producers, but without success, owing to the deposit of salt and the effect on the vaporizer of the rolling and pitching of the vessel. It is in fact a mooted question whether the presence of considerable water gas is not a detriment rather than an assistance to a smooth-running engine. This being the case, it is only necessary to find a substitute for steam for the softening of the clinker. Exhaust gas introduced under the grate has this effect. The exhaust line from the engine is accordingly tapped and a portion of the exhaust by-tapped to the producer. To keep the ashes and the bottom of the producer cool, a small quantity of water is run into the ash-pit, say fifty drops per minute on a 75-horsepower producer. Such steam as is formed from this small amount of water of course is turned into water gas and assists slightly in keeping down the clinkers.

With proper care the grate should last two years or more as the best operating conditions require a layer of ashes between the grate and the hottest fire zone. The fire-brick lining is good for three to five years, according to usage and the skill of the operator. Relining is comparatively inexpensive.

The gas is taken off near the top of the producer through a two-way water-cooled valve, one outlet to the scrubber, and the other to the purge stack. The latter carries off the gases from the producer when the engine is not drawing same through the scrubber. The purge pipe should be of sufficient height to induce enough natural draft to keep the fire alive when standing by for long periods—weeks if desired. The purge pipe is most conveniently run into a dummy stack which may also contain the exhaust mufflers. The scrubber, whose function is to cool and clean the gas, is located on top of the engine room house and after the stack on the Mary A. Sharp. It is of the static type, is cylindrical in shape, and fitted with baffles, each section being provided with three water sprays. The material is copper and monel metal to withstand the effect of salt water from the sprays and sulphuric acid from the gas.

The operation of the producer is exceedingly simple and mechanically and chemically similar to that of the self-feeding parlor stove. Starting a new fire, a few bushels of shavings and charcoal (preferred) or wood are thrown on the grate. As soon as this is lit off the fan is started, giving a gentle blast to the fire. Directly coal is fed through the hopper until the producer is full. Very frequently good gas of sufficient volume to operate the engine can be obtained in thirty minutes. The coal on the grate is burned to complete combustion (CO_2). This gas is reduced to CO on passing through the red and black hot fuel zones above. The fire can be kept for months at a time and the producer is capable of being continuously for long periods without shutting down the engine, the removal of the ashes and poking down the clinker being done while the engine is in full operation, and this without any serious fluctuations in the quality of the gas and consequently the speed of the engine. The entire system of producer, scrubber and piping while the engine is operating is under vacuum, the suction of the engine inducing a draft in the producer proportional to its speed or power requirements.

On a plant of the size of the Mary A. Sharp, it takes about thirty minutes to clean the fire in the morning, that is, poke down the clinkers, rake out the ashes, and fill the producer with coal. With a small (2-horsepower) auxiliary engine for running a blower, it takes about ten to fifteen minutes to get up gas, a total of three-quarters of an hour from the time the engineer steps aboard until he is ready under way. On long trips the fire should be sliced on the grate and poked from the top every hour. Once an hour is often enough to charge with coal. On short runs of an hour, or an hour and a half, no poking is necessary.

Perhaps the most interesting feature of these two installations is the engine. It is two-cycle in principle, in that an explosion is effected in each cylinder each revolution, scavenging in action and substantially equivalent to the four-cycles in efficiency. The commercial use of producer gas on shipboard involves the vital questions of weight, space, first cost, and simplicity. The two-cycle principle naturally appeals to the imagination of the marine engineer as fulfilling these requirements more easily than the four-cycle provided it can be made economical and reliable. In land practice we know of the Koerting two-cycle engines which are economical on full loads. Now a marine engine is operated at full power continuously. Hence it is evidently possible to fulfil the specifications for economy. Reliability is a matter of careful design, good material and workmanship, and high grade ignition devices. If the use of a four-cycle engine is made difficult by reason of its weight, space required and first cost, the two-cycle engine should make marine producer gas power installations commercial.

The engines, as stated, are two-cycle. The explosive charge after expansion is completely blown out by a charge of air before the gas is admitted to the cylinder. The admission of the latter is so timed that none of the gas is lost through the exhaust ports. This gives a clean charge of great power and efficiency, and without any possibility of back-firing. Producer gas is particularly susceptible to back-firing, due to its slow burning, and eliminating all back-firing in the type of engine described a decided forward step has been made. The saving in heat losses and in friction due to an explosion every revolution in each cylinder compensates in large part for the loss in the air gas compressors. The working cylinders are of the ordinary construction but with exhaust ports extending around the entire circumference of the cylinder. The exhaust gases pass with the utmost freedom from the cylinders to a large water-jacketed exhaust manifold. Differential pistons and cylinders are used as gas pumps. The downward stroke of the piston induces direct suction on the producer, compressing same into a receiver on the upward stroke. This receiver communicates with the cylinder heads and the air and gas valves controlling their admission. Air only is drawn into and compressed in the base and of a volume of about 50 per cent. in excess of both the working piston displacement and the clearance in the combustion chamber. Both air and gas are admitted to the cylinder through mechanically operated valves and are so timed that such a proportion of the air as is intended for scavenging is firstly admitted, blowing out the burnt gasses. The gas valve is then opened, admitting gas direct to the cylinder and mixing with the balance of the air from the base.

On July 14 and 15 a non-stop run of eighteen hours was made from Baltimore to Sharp's Wharf on the Rappahannock River. Careful records were made of distances, revolutions, and coal consumed. Following is the condensed log of the trip:

July 14:
- 7:48 A. M. Started to blow fire (using hand blower) after two nights lay over.
- 8:20 A. M. Left dock.
- 8:36 A. M. Arrived at coal dock. Took on ten tons of coal.
- 10:42 A. M. Left coal dock.
- 11:30 A. M. Arrived at oil dock. Took on one barrel of gasolene for canning factory.
- 11:14 A. M. Left oil dock.
- 1:55 P. M. Passed Sandy Point.
- 6:43 P. M. Passed Cove Point.

July 15:
- 1:33 A. M. Passed Windmill Point.
- 5:30 A. M. Arrived at Sharp's Wharf. Cruised around the river.
- 6:00 A. M. Tied up and closed draft on producer.

Weather favorable for entire trip with light variable winds. Course steered during the night not a true one, owing to compass not being adjusted. Distance from oil dock to Sharp's Wharf approximately 155 miles, but probably covered 160. No stop was made for any cause whatever.

Blowing up fire	32m.
Actual running time	19h. 15m.
Stand-by	2h. 25m.
Average revolutions	234.5
Average indicated horsepower	60.8
Indicated horsepower hour (allowing 40 per cent. for blowing up fire and standbys)	1,246
Coal burned (allowing 74 pounds to fill producer at end of trip)	1,408 lbs.
Coal per indicated horsepower	1.13 lbs.
Weight of engine complete, approximately	9,500 lbs.
Weight of producer	6,000 lbs.
Total	15,500 lbs.
Weight per B. H. P. (75 B. H. P. commercial rating)	205 lbs.
Economy of space is important, the length of engine and producer room being but	13ft. 3in.

No particular economy or horsepower tests were made on the Superior. She is used as a fish-runner out of Bayfield, Wisconsin, collecting fish among the Apostle Islands. This service is probably the most severe that a producer plant can be subjected to as it is constantly stopping and starting. Some ten to fifteen wharves are made in the course of the day with stops of from five to thirty minutes.

Distance Cut by Panama Canal.

The distance via the Strait of Magellan from New Orleans to Callao in Peru is 10,000 miles. By the opening of the Panama Canal this will be cut to 2,750 miles, according to the Marine Journal. From this port to Japan or China via the Suez Canal is more than 13,000 miles. By the Panama Canal this distance will be 3,000 miles shorter. From San Francisco to New York via the Strait of Magellan the distance is 13,000 miles. By the Panama Canal 7,790 miles of this will be saved, bringing these two ports within 5,300 miles of each other. In other words, a steamer making 16 miles an hour will then reach this port from San Francisco in about 14 days instead of 60 as now.

Where Fresh Water Comes From.

Of all natural stores of water the ocean is, of course, the most abundant, and from it all other water may be said to be derived. From the surface of the ocean a continuous stream of vapor is rising up with the atmosphere, to be recondensed in the upper regions and precipitated as rain, snow and sleet. Some eight-elevenths of these precipitates return directly to the ocean; the rest, falling on land, collects into pools, lakes, rivers, or else penetrates the earth, perhaps to come to light again in springs and wells.

BEFORE YOU BUY ANY FIREARM OR AMMUNITION, YOUR FUTURE SATISFACTION DEMANDS THAT YOU FIRST *SEE* THE INVALUABLE FEATURES OF

Remington — **UMC**

Trade Mark — Reg. U. S. Pat. Of.

Remington firearms lead in improvements.

Every Remington improvement fills a long felt want in the shooter's heart.

They mean maximum pleasure and satisfaction through greater efficiency and dependability—and absolute safety whatever the conditions.

You know that all REMINGTONS are built solid breech, hammerless:

—that the REMINGTON **Autoloading Rifle** is the only recoil operated rifle that locks the cartridge in the chamber until after the shot is fired.

—that the REMINGTON **.22 Repeater** has fewer, simpler, bigger and stronger parts to its action than any other repeater.

—that every U M C cartridge in every box is absolutely perfect because individually inspected at every stage of construction.

—that the steel lining in U M C shot shells saves the load from weakening in rainy weather by excluding all moisture.

But—have you actually seen and examined these features as yet for yourself? You'll fully appreciate the big meaning of the name REMINGTON-UMC when you do. Any dealer will gladly demonstrate.

Remington and U M C—the perfect shooting combination.

April 18-20.—Des Moines, Ia.—Iowa State shoot. Budd & Whitney, Mgrs.

DRIVERS AND TWISTERS.

At the monthly merchandise shoot of the Smith Gun Club, of Newark, Chas. T. Day, Jr., took first prize with a score of 45 out of 50, made from the 22yd. mark.

The City Park Gun Club has made application to the Interstate Association for registration of the Louisiana State tournament to be held April 10, 11 and 12, on the grounds of the City Park Gun Club.

The great match for the E. C. cup, between Lester S. German and W. R. Crosby, fixed to take place at Chicago, Jan. 14, has conditions which try out the contestants severely, namely 100 targets unknown angles, 100 targets, expert rules, and 50 pairs.

C. W. Billings, R. M. Owen, Dr. D. L. Culver, Geo. J. Corbett, W. B. Ogden, Byron E. Eldred, D. T. Leahy, R. L. Spotts and E. W. Reynolds have all signified their intention to attend the Midwinter Handicap tournament at Pinehurst, N. C., the week of Jan. 16 to 21. Many others from about New York will go, if business matters permit their absence.

Secretary L. H. Schortemeier, 201 Pearl street, New York, under date of Jan. 7, advises us as follows: "The Bergen Beach Gun Club, of Brooklyn, N. Y., will hold their annual series of shoots in February, March and April, 1911. Dates will be announced later. Handicaps 16 to 19yds.; expert traps; best two out of three scores to count. All amateurs welcome. Manufacturers' representatives will shoot for targets only."

In the Philadelphia Trapshooters' League contest, held by teams at Holmesburg Junction and Meadow Springs, Jan. 7, the results showed the standing of the clubs at present to be as follows: Highland, 6 points with 896 targets; South End and S. S. White, 5 points each, with respectively 866 and 861 targets; Meadow Springs, 3 points and 833 targets; Haddonfield, 3 points and 804 targets. The competition is obviously very close, and as this was the second contest of the series, it is any one's race as yet.

At the Pinehurst, N. C., tournament, Jan. 18-21, a most generous program is provided for the fourth annual midwinter handicap. Optional sweeps will be shot in conjunction with every target event, valuable medals will go to the high average winners, and the Squier money-back system will protect the weaker shooters. The Preliminary Handicap will be shot on Jan. 20, while the Midwinter Handicap, the chief event of the tournament, will be shot on Jan. 21. The members of the excellent handicap committee are C. W. Billings, New York Athletic Club; R. M. Owen, New York Athletic Club; D. T. Leahy, Crescent Athletic Club; J. C. Todd, Newburyport, Mass.; Chas. Newcomb, Independent Gun Club, Philadelphia, Pa.; H. T. Edwards, Union City, Tenn.; Harry Lee, Greensboro, N. C.

BERNARD WATERS.

Phoenixville Tournament.

PHŒNIXVILLE, Pa., Jan. 5.—There was a light attendance at the registered tournament of this club to-day. Scores averaged low, as the following totals will show:

Tri-State Live Bird Tournament.

THE fifth annual tournament for the live-bird trophy and championship of Ohio, Indiana and Kentucky, was held by the Northern Kentucky Gun Club on Jan. 2 and 3, at the grounds north of Dayton, Ky. The weather was not favorable for shooting, and doubtless caused a much smaller attendance than had been expected. The birds were a very good lot, better than any which have been had for recent shoots in this section. There were few sitters and most of the birds were extremely strong and fast flyers, as can be seen by the number of "dead outs" which were scored.

The committee having charge of the arrangements consisted of John A. Payne, Cincinnati, O.; J. V. Dea, Maysville, Ky.; Geo. Dameron, Bellevue, Ky.; John Schaeck, Covington, Ky.; Geo. Walker, Ft. Thomas, Ky.; C. B. Woodbury, Dayton, Ky.

Dr. I. P. Gould, the club secretary, handled the financial end of the shoot.

A fine dinner, served by Mrs. Taggart each day, was a feature of the shoot which all enjoyed. Another pleasing feature was the egg-nog, à la Payne. Those who tried it said it was the best ever, and it certainly improved their shooting.

The local shooters turned out fairly well, but many well-known live-bird shots were absent. Among the out-of-town visitors were Jesse Young, Chicago; W. Webster, H. Smith and Lon Fisher, Columbus, O.; T. Clay, Austerlitz, Ky.; J. S. Day, Midland, Tex., and H. A. Woody, Cynthiana, Ky. The bunch from Lexington and other towns which had been expected, failed to materialize, and Indiana had no representatives, even the veteran Ed Voris, who won the title in 1908, failed to appear.

Everything ran smoothly during the two days, and, barring the weather, the tournament was a big success.

First Day.

Monday, the opening day, was cold, with a strong, chilly wind blowing, and the sun hidden by heavy clouds, altogether a disagreeable day for outdoor sport, and the shooters stayed in the club house near the fire when not at the score. The attendance was fairly good and a number of local shooters entered the events. There was a big crowd of spectators in the afternoon, more than have attended a shoot here in a long time. The birds were the best the club has had at any of its shoots during the past season. A very few sitters, most of them being strong, fast flyers, and when once started off down wind, it took quick work and straight pointing to bring it down inside the boundary. If a bird escaped it had to run the gauntlet of a crowd of bushwhackers surrounding the grounds, the fusilade sounding like a regiment of soldiers firing at will. George Keifer filled the office of referee to the satisfaction of every one, and Dr. Shouse was official scorer. The handicapping committee consisted of T. Clay, Austerlitz, Ky.; Ed Voris, Crawfordsville, Ind., and F. Alkire, Williamsport, O. The last two gentlemen were absent and their places were filled acceptably. The program consisted of the tri-State championship contest at 25 birds, handicaps 29 to 33yds. The first 15 birds of this event, and the last 10 birds constituted events 2 and 3, entrance $10 and $5 respectively, divided high guns. The shooting began about 9:30 with a practice event at 10 birds, in which Holloday, Jr., was high gun with a straight score. In the championship event there were nineteen entries This was a close race between H. A. Woody, of Cynthiana, Ky., and John Schreck, of Covington, who were tied on 19 kills, after shooting at 20 birds, Schreck missing his third bird and Woody losing his eighth bird dead out. In the last five birds of the match, Schreck let two get away, and Woody missed one, winning the title and trophy by 23 to 22. Holoday, Jr., was high man in the event with a score 24, his 20th bird falling dead just over the boundary; but he was ineligible to win, being a professional. Dameron, unquestionably one of the best shots in this section, had an off day, and withdrew after shooting at 10 birds. Of these he had the hard luck to lose 3 dead out. T. Clay was also unlucky, three of his four lost birds were dead out, all of them barely clearing the boundary. In the second event Holoday, Jr., was high with a straight score. Second place honors were divided by Clay, Schreck, Woody and McFee on 14 each. Jesse Young captured first in the third event with 10 straight. Day, Gould, Holoday, Jr., Woody and Phillips second with 9 each.

The tri-State trophy has been won by C. A. Young, Springfield, O., in 1906; Horace Bonser, Hartwell, O., 1907; Ed. Voris, Crawfordsville, Ind., 1908; George Walker, Ft. Thomas, Ky., 1909; H. A. Woody, Cynthiana, Ky., 1910.

The regular events were finished in good season, and the balance of the afternoon was devoted to $3 miss-and-out events. The scores:

Practice event, 10 birds, $5 entrance, 60 and 40 per cent.:

Second Day.

The sportsmen awoke on Tuesday to find the ground covered with six or eight inches of snow, and more coming. The outlook was decidedly dubious, and a notice in the daily papers that the shoot had been declared off had the effect of cutting the attendance in half, many of the visitors returning to their homes. Several of the local men also failed to show up, although the start was delayed until nearly noon. Only nine men shot in the day's events, and there were very few spectators, the weather also cut down the number of bushwhackers. The birds were fast, and included an unusual number of white ones, which were extremely difficult to see in the snow. The handicapping committee was chosen from the shooters present, and consisted of T. Clay, J. Young, Chicago, and J. Schreck, Covington.

The program consisted of an event at 50 birds, two events at 20 birds each, and one at 10 birds, being the first 20 the second 20 and the last 10 of the 50-bird race respectively. The big event was won by Jesse Young with a score of 47; 2 of his lost birds were dead out; his 33d and 41st birds just cleared the boundary. His 45th bird was a fast one, and escaped, apparently untouched. John Schreck was second with 45, and of his 5 lost birds, 4 fell dead just over the line. Walker was in hard luck, losing 6 birds dead out. Young captured first money in the second event on a straight score, with Day and Schreck close seconds on 19 each. In the third event Payne and Young divided first on 19 each; Gould, Schreck and Dea second with 18 each. Day and Holaday tied for first in the fourth event on straight scores; Walker and Schreck second with 9 each.

The regular events were finished about 3 o'clock, and five specials were pulled off, the last two being at 5 pairs each. It was dark before the last pair was shot. In double shooting Young was high with 15 out of 10 pairs; Payne and Day killed 14 each. For the day; in all events at 100 birds, Young was high with 88. Day and Payne tied on 86. The scores:

Event No. 1, 50 birds, handicaps 26 to 33yds; entrance $20, birds extra; three moneys, 50, 30 and 20 per cent.; class shooting. The race shot in series of 10; 10 straight, go back 1yd for next 10; 9 out of 10, stay at same mark; 8, or less out of 10, advance 1yd. No one to go nearer than 26, nor further back than 33yds..

The Palefaces.

BOSTON, Mass., Dec. 31.—The last day of the old year was very well taken care of by the Palefaces at their annual winter shoot, held to-day, and with the thermometer now nearly to the zero mark, it was a wonder that thirty-six shooters ventured out to do justice to a dandy program.

Otherwise the weather was the most perfect of any that could be had, and it was peculiar, to say the least, that there were not more high scores. Clarke and Burnes were the real ones with the high average for the former and the high on the 100-bird for the latter, the 95 per cent. of Burnes being a dandy bit of shooting.

Osborne started in like a sure winner, but an unfortunate event or two played havoc with him, and after vainly struggling to keep the lead, had to see it go to Clarke, who always kept at it no matter what the result was.

In the program Hank Stevens nosed out on top after a see-saw battle, but did not quite catch Doctor. Scores:

J. D. MASON, Sec'y.

Buffalo Audubon Gun Club.

BUFFALO, N. Y., Jan. 2.—The team event was one of the features. There were twelve men on each team, captained respectively by Lambert and Covert. Lambert's team won easily with a total of 303 to 280 out of a possible 360.

In the handicap event, 25 targets, E. F. Hammond, a veteran member of Springville, scored 25 from the 20yd. mark. Geo. Fish, of Lyndonville, was close up with 24, and made high average for the day with 161 out of 175. For third place, Cox, Wright and Talcott tied on 156. Scores:

BUFFALO, N. Y., Jan. 7.—The first shoot of the Audubon Gun Club for 1911 was held to-day. The marksmanship was not really up to the standard, but the sharp wind which made the birds jump from their otherwise natural flight, is held easily accountable for the poor scores.

At that, breaking 70 out of 80 is fair shooting, and that is the scores that Clarence S. Sidway and Jack Talcott made. Both started out with rather poor scores in their first event. Sidway also won Class A with 18 and also made the only straight of the day in the third event. Will Imhoff had a rather easy win in Class B with only 14 to his credit. Dr. J. M. Burke and Renn Spaulding finished the excitement in Class C. Both were shooting in the same squad, breaking their birds nicely until the 17th, when both missed, but finished out with 19 each.

In the shoot-off which followed, Dr. Burke, who is certainly hitting them just right lately, kept up his former pace and finished with 18. A. C. Conley, of Cohocton, N. Y., won the Reed trophy with 19 from the 20yd. mark.

Each man shot at 80, except E. Wacker, who shot at 20.

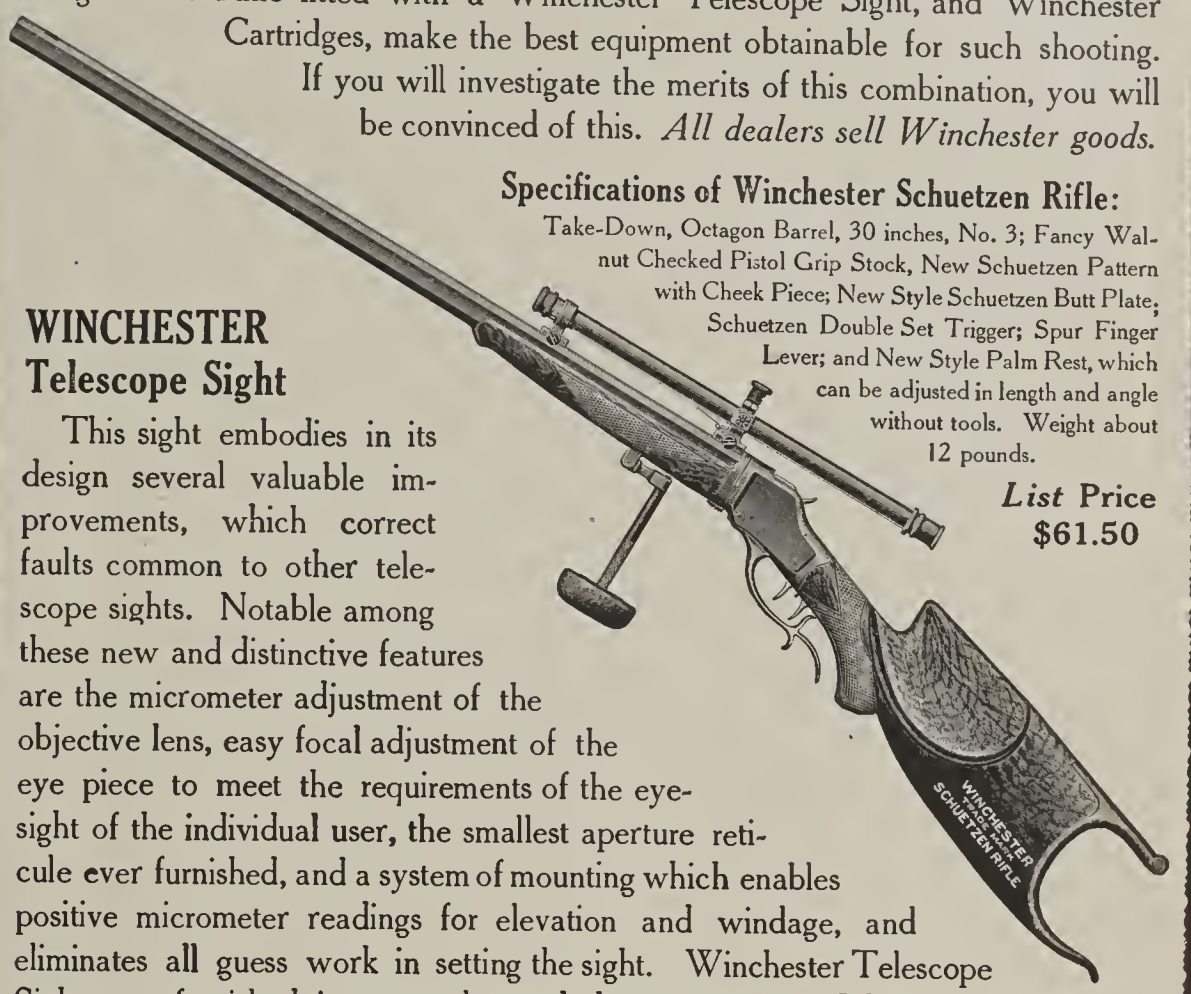
WINCHESTER

TAKE-DOWN SCHUETZEN RIFLE
Equipped with Winchester Telescope

To excel at indoor target shooting, one must have the best possible equipment. If results are a criterion, then the Winchester .22 Caliber Take-Down Schuetzen Single Shot Rifle fitted with a Winchester Telescope Sight, and Winchester Cartridges, make the best equipment obtainable for such shooting. If you will investigate the merits of this combination, you will be convinced of this. *All dealers sell Winchester goods.*



Specifications of Winchester Schuetzen Rifle:

Take-Down, Octagon Barrel, 30 inches, No. 3; Fancy Walnut Checked Pistol Grip Stock, New Schuetzen Pattern with Cheek Piece; New Style Schuetzen Butt Plate; Schuetzen Double Set Trigger; Spur Finger Lever; and New Style Palm Rest, which can be adjusted in length and angle without tools. Weight about 12 pounds.

***List* Price $61.50**

WINCHESTER Telescope Sight

This sight embodies in its design several valuable improvements, which correct faults common to other telescope sights. Notable among these new and distinctive features are the micrometer adjustment of the objective lens, easy focal adjustment of the eye piece to meet the requirements of the eyesight of the individual user, the smallest aperture reticule ever furnished, and a system of mounting which enables positive micrometer readings for elevation and windage, and eliminates all guess work in setting the sight. Winchester Telescope Sights are furnished in two styles and three powers. They are adapted to practically all makes of repeating and single shot rifles. ***List* Price, $29.00.**

Columbus Gun Club.

THE last regular monthly shoot, held Dec 31. was a good one. Thirty-two shooters took part. It seemed like old times to see a nice crowd of shooters out once more. Most all of the shoots held by the club in the past year were well attended, though the weather and the car strike cut the attendance some.

The club will continue to hold a regular monthly shoot the same as last year, so those out-of-town shooters can come in once a month and do some trading and shooting.

Clarence Coburn was high amateur. Bert Cooper second; Binney Nolder and Wm. Webster third. Frank Hulshizer and Harry Hopkins fourth; J. R. Taylor was high professional; R. O. Heikes second; W. R. Chamberlain third.

The next shoot will be on Jan. 26; 150-target program, on the money-back system. Feb. 22 and 23 will be the annual midwinter shoot; 150-target program each day, on the money-back system. This system seems to be the best for the poor shooter, as all one can lose is the price of targets at 2 cents each. Any one ought to feel safe in shooting when he can only lose so much and stand the same chance to win. The club thanks one and all for your liberal patronage, and hopes to see you all as guests of the club many times in 1911. A prosperous new year to you all.

Won by G. W. Lembeck.

Manhasset Bay Y. C.

PORT WASHINGTON, L. I., Jan. 1.—A heavy rain and thick fog spoiled the weekly shoot of the Manhasset Bay Yacht Club. Only six members showeod up. These, however, shot the full program and furnished some good sport. Scores:

Ten birds, scratch, sweepstakes; won by Hoyt:

H L Hoyt, Jr.	9	C M Gould	4
J E Meyer	8	I O'Rourke	2
J W Alker	6		

Fifteen birds, scratch, sweepstakes; won by Alker:

J W Alker	14	I O'Rourke	4
J E Meyer	13	C M Gould	3
H L Hoyt, Jr.	10		

Twenty-five birds, handicap, sweepstakes; won by J. W. Alker:

J W Alker	3	25	CM Gould	6	21
H L Hoyt, Jr.	0	22	B G Loomis	2	23
J E Meyer	3	24	I O'Rourke	7	13

Alker cup, 25 birds, handicap; won by Loomis:

B G Loomis	2	23	H L Hoyt, Jr.	0	17
J W Alker	3	21	C M Gould	6	17
J E Meyer	3	20	I O'Rourke	7	15

Yearly prize, 25 birds; won by Gould:

C M Gould	6	25	J E Meyer	3	20
H L Hoyt, Jr.	0	22	B G Loomis	2	19
J W Alker	3	20	I O'Rourke	7	17

One hundred birds, scratch:

H L Hoyt, Jr.	81	B G Loomis	76
J W Alker	77	C M Gould	51
J E Meyer	76	I O'Rourke	45

Jan. 8.—The regular weekly shoot of the Manhasset Bay Yacht Club was held to-day. C. M. Gould, who had just bought a new L. C. Smith gun, surprised us all by getting away with two events. Scores:

Sweepstakes, 10 birds, scratch:

C M Gould	9	J E Meyer	7
H L Hoyt, Jr.	9	E A Sierck	6
E P Alker	8	G C Meyer	6
H Funke	8	G Brinkman	1
J W Alker	7		

Sweepstakes, 15 targets, scratch:

J E Meyer	14	J W Alker	11
C M Gould	13	E A Sierck	11
H L Hoyt, Jr.	13	E P Alker	10
J C Meyer	12	W Brinkman	6
H Funke	12		

Swepstakes, 25 targets, handicap:

J W Alker	2	25	B G Loomis	3	21
H L Hoyt, Jr.	0	24	C M Gould	5	20
G C Meyer	4	23	E P Alker	5	18
J E Meyer	3	22	E A Sierck	2	10
H Funke	2	22	C M Gould	4	25

Yearly cup, 25 targets, handicap:

J W Alker	3	24	H L Hoyt, Jr.	0	14
J E Meyer	3	23	G C Meyer	4	17

Alker cup, 25 targets, handicap:

G C Meyer	4	25	J E Meyer	3	21
J W Alker	3	23	H L Hoyt, Jr.	0	20
H Funke	2	23	C M Gould	5	23
E A Sierck	2	22	B G Loomis	3	22

One hundred targets, scratch:

H L Hoyt, Jr.	84	C M Gould	75
J W Alker	82	G C Meyer	71
J E Meyer	78	E A Siercy	60

Ten double targets:

H L Hoyt, Jr.	13	J E Meyer	6
J W Alker	8	G C Meyer	6
C M Gould	7		

Ossining Gun Club.

OSSINING, N. Y., Jan. 2.—The President's shoot, so-called because the president, Col. Franklin Brandreth, provides the prizes, was well attended, though the rain was steady and the mud deep. The shooters were divided into two classes, A and B. Everyone won a prize, and there were more prizes than shooters. John T. Hyland was high with 54 and took the cup. Scores at 60 targets:

J T Hyland	54	F Zarr	40
Jack Fanning	54	W Fisher	39
R B Lawrence	48	W H Hyland	39
A L Burns	48	S A Kipp	37
L F Lyons	47	B Partrick	36
W S Smith	45	J H Moran	33
D Brandreth	45	J V Kirby	33
C G Blandford	44	W F Wagner	33
C P Dietrich	44	J F Jenkins	30
N J Tuttle	43	G Brandreth	30
I Willi	43	J L Barlow	27
Col F Brandreth	42	G B Hubbell	14
W A T Clark	41	M C Palmer	0
R Lawrence	40		

The first shoot for the Poughkeepsie cup was at 100 targets, and resulted as follows:

J T Hyland	85	N J Tuttle	72
A Bedell	81	Col F Brandreth	71
D Brandreth	80	W S Smith	71
C G Blandford	76	W A T Clark	71
A L Burns	76		

At the conclusion of the shoot each contestant thanked Col. Brandreth for the delightful afternoon made possible by him, and realizing that his friends were happy, he left for home in a most cheerful mood.

Montclair Gun Club.

MONTCLAIR, N. J., Jan. 7.—In event No. 1 to-day Messrs. Boxall and Frazee tied for first place with 21 targets each. Event No. 2, the first leg on the January cup, also resulted in a tie between Messrs. Frazee and Young. Frazee won out in the shoot-off, which occurred in the following event, he breaking 24 targets to Young's 15, and this with a new pump gun that he was using for the first time.

In the fifth event, a pick-up team race for two-man teams, each man picking up his partner's missed birds, but four targets were missed out of a total of 60—a very good showing.

Event 4, a walking match, was won by Frazee with 8 breaks.

Events:	1	2	3	4	Events:	1	2	3	4
Targets:	25	25	25	10	Targets:	25	25	25	10
G W Boxall	21	17	19	1	E Winslow	16	12	..	1
C L Bush	15	18	14	6	Y T Frazee	21	22	24	8
J C Atwater	18	16	19	2	L Young	..	22	15	4

Two-man team race:

	Team No. 1.		
Winslow	10	Young	9—19
	Team No. 2.		
Bush	10	Frazee	9—19
	Team No. 3.		
Boxall	9	Atwater	9—18

E. WINSLOW, Sec'y.

The FOREST AND STREAM may be obtained from any newsdealer on order. Ask your dealer to supply you regularly.

The Gun of To-Day.

How frequently in a day's shooting one feels certain a bird was correctly aligned by the gun, but was missed; and in like manner a bird, well brought down, jumps up and runs away. Scientific research has furnished a complete explanation; it is the gun's fault. Recent experiments, tests, and instantaneous photographs have put the matter in a nutshell, if the results are tabulated in their proper juxtapositions; and the most careless, unscientific observer must admit on the evidence of the experts that the gun of to-day stands convicted of serious imperfection of shooting and of antagonisms in abilities.

At present the barrel has yet to be invented which will perform perfectly the same shooting requirements at both ends of the range. We want full choke pattern at 40yds., a half choke at 30yds., and a true cylinder at 20yds. The present boring for the one will not give the other. But, further than this, we want an even distribution of pellets, and reliable consecutive performance; the former is not obtained with choke, and the latter certainly not with cylinder.

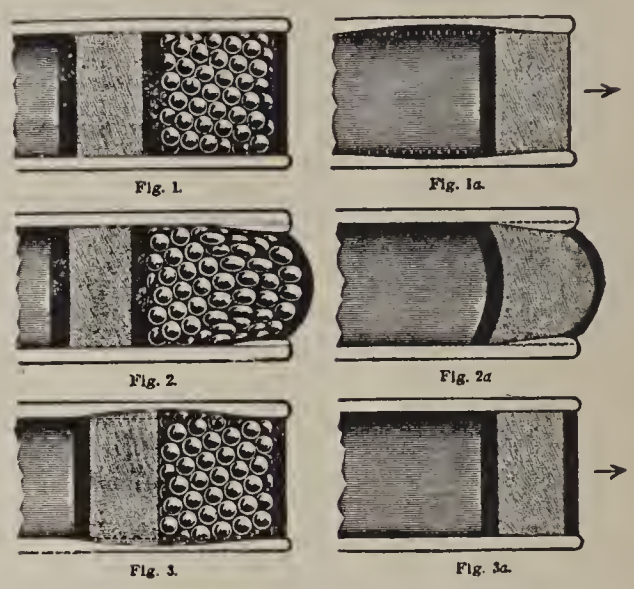

Fig. 1. Fig. 1a. Fig. 2. Fig. 2a. Fig. 3. Fig. 3a.

In English shooting, as now commonly found, quite 80 per cent. of the shots in a day are at less than 30yds. range, while in driving and shooting inside the covert probably 50 per cent. will be under 20yds. For all such the choke pattern is wrong; but the cylinder is often inconsistent, "cartwheel" and "holiday patchy" patterns frequently letting off the bird, though it was correctly covered by the gunner. Then we have the "tall birds" high overhead. Here the choke pattern is essential; the head and neck of the pheasant is the only vulnerable point, the body is a convex target with closely packed feather armor. The head and neck give a target of about 5in. by 1in. Place such a form on the best cylinder pattern obtained at 40yds., there will be found at least six spaces within the 30in. circle in which not a single pellet would enter; and on an average of about two in ten patterns practically the whole vital part of the bird would find a vacant space. The cause of this we shall see. In the gun of to-day shot spread is obtained by plain cylinder, augmented and frequently ruined by gas blast and wad disturbance. Close shot pattern is got by constriction of the charge by choke boring, and spoiled by the crushing and deforming of the pellets to a considerable extent. Intermediate boring does not avoid these faults. The so-called "improved cylinder," more reliable than plain cylinder in even repetition of pattern, and very excellent at close ranges, has the fault of open work when it comes to "tall birds," and it suffers occasionally from cartwheel disorder. The half choke undoubtedly shoots far too close a pattern at 12 to 20yds., and at 25 and 30yds. it loads the center and starves the rest of the 30in. area.

The mechanism of the gun of to-day has obtained a stage of perfection far in advance of its quality of shooting. The design of the gun may, however, be open to question. A point of the highest import is the placement of the barrels. The question of "under and over" instead of "side by side" is now in the testing stage with several leading gunmakers. So also the question of "magnum," smaller bores being preferable to "standard" larger bores. But these are all of the "gun of to-morrow." Having nothing to do with the gun trade, I am not bashful at glunging into the mysteries of technical gun making, even if I flounder. But I carry as a life buoy the dictums of the expert professors and experimentalists, the findings of the exhaustive trials made by the Field the unanswerable evidence of photographs, and the results of my own experiments and shooting experiences. All these I take to be gospel sufficient for scheming improvements. There can be no doubt that often old ways may be usefully fitted to new requirements, and many a sound principle has been dropped in the fashionable rush for a new line. Such, for instance, was the "recess choke" or "tulip" boring, used in the days of black powder, and dropped to the fashionable "choke," and I think it deserves reconsideration, minus the choke, for nitro powder.

You cannot photograph within the barrel; what there happens must remain for an educated guess; nor can you photograph within, say, 18in. outside, because of the explosion flare light. But spark photographs have been taken and published at 24in. out by Mr. W. D. Borland, and at 4yds. by Prof. Boys. Some of these researches are published in the transactions of the British Association for Science of the meeting held at Edinburgh, and those of Mr. Borland in a most interesting article, with prints of the spark photographs, in the Field of Aug. 15, 1908. Though criticism of scientific matters demands

exact words, I must here be short, and so speak generally. The result of the investigations is, shortly, that in "choke" the pellets showed they had been jammed into one another by the construction, and a large number were badly crushed out of spherical shape. The column was much elongated, and was centrally crowded. In the cylinder shots the spark photographs distinctly showed that the gas blast, allowed by cylinder boring to act upon the shot, was the cause of fringe dispersion, and probably of cartwheel pattern, and certainly of the wad being driven into the charge. Probably a graphical description, by sketches, will be the shortest way of explaining the action of the different borings, so as to grasp the findings of the various scientific experiments. The sketches are not intended to be actual scale, but are very nearly so, and the formation of the shot charges is mere freehand as nearly as may be in accord with the actual results photographed. All experiments thus far recorded go to prove that the charge of pellets in flight, and clear of the powder gas blast, gradually separate outward, and continue to do so as the range is traveled. The extent of spread, when unaffected by the gas blast, is much dependent on the amount of elongation ot charge set up at the muzzle by constriction of bore; that if there was no constriction of shot and no interference by gas and wad we should find quite a new set of readings on the targets all down the range. A careful reading of the voluminous experiments will, I think, leave it clear that expanding flight, once set up, cannot in any way be controlled later into so-called choke formation, you cannot get true cylinder pattern at 15yds. and full choke pattern at 40yds.

Taking choke first (Fig. 2), we see the shot being constricted by having to crush through a smaller bore than the rest of the barrel. The gas will not give way, so the soft lead is much crushed. Fig. 2*a* shows the felt wad and its cards being squeezed into the choke, and thereby for a moment they are checked in speed, and the shot charge, now clear, gets away; 2*b* shows the last act ot the wads momentarily hindering the gas blast, which thus only overtakes the shot when weakened in its power. The cylinder (Figs. 1 and 1*a*) shows no hindrance either to shot or wads, no deformation of shot column (possibly some barrel friction). Thus the shot and wads all leave at once in contact, and are immediately overtaken and passed by the gas blast. Fig. 1*b* is in accordance with Mr. Borland's photograph of the actual state of things at 24in. out, and shows what happens at the muzzle. There is no wad check in plain cylinder boring, so the blast drives the wad into the base of the shot, and at least it holds the felt card wads in the base of the shot, besides blasting through and separating the annular transformation of the shot base thus created. Of Fig. 3 the remedy, later attention can be given.

Mr. Borland's article says, "It is not unreasonable to conclude that the shot emerges from the cylinder in the form of a flat-topped cylinder of the diameter of the barrel, with at least the card wad close up to the base of the cylinder [I suppose this means the outside form of the shot]. On the exit of the card over powder the powder gases emerge from the muzzle at a much higher velocity than the shot, and press the wad next the shot into closer and closer contact. The shot being no longer confined in the barrel, is free to flow in a lateral direction, and the mass widens first of all at the base, leaving an annular area around the wad unprotected against direct gas blast. In the photographs there are to be observed a large number of striations parallel to the line of fire surrounding the wads, and extending, to a marked degree, to about the center of the shot charge. There is little doubt that these striations are the result of the travel of the gas blast more or less mixed with air, and that it is this gas blast which in the first instance caused the wad to expand the base of the mass of shot, and then, at a later stage, acting upon the unprotected annular area of the base, produces more dispersion, and finally gives rise to the wide dispersion of outside pellets observed at 40yds. with cylinder patterns. The second photograph (mem. also cylinder) shows the truncated cone shape of the shot mass in even more remarkable degree; the size of the shot being smaller in this case is probably the explanation of the more strongly defined enlargement. Then it follows that any device or procedure which will protect all or any given proportion of the shot from the combined action of wad and powder gases will result in a reduced dispersion, and that is what the choke is calculated to effect."

This is the scientific account of the disease common to cylinder; but the remedy suggested is worse than the disease. The article practically admits this. In speaking of the choke photograph and the action of choke, it says, "The wadding in its turn is delayed by the obstruction (the choke) for an infinitesimal period, but sufficiently long to delay the issue of the powder gases and to diminish the pressure of the card wad upon the base of the mass of shot. * * * The mass of shot (seen in the photograph; see also Fig. 2*b* here) is utterly different in its form from the cylinder projection; it occupies an actual length of 1¾in. as compared with ½in. in the case of the cylinder. On the other hand, the diameter of the column only very slightly exceeds that of the 12-bore wad. The shot pellets are only loosely grouped, and the card wad is not bedded against the base of the mass." These quotations are sufficient for the present; they give indisputable scientific findings on a subject on which there has been much vague dispute, but they also accord well with facts found in other lines of research, and with the patterns obtained on the targets at the far end of the range under the two classes of boring. Other experts, in speaking of other matters, have given information of value here. The velocity of the gas blast at the exit is given at 3900ft. per second, about three times the speed of the first shot charge. May we not infer as almost a certainty that in some cases the blast goes right through the shot, or drives the hard crushed felt wad right through, and forms the "cartwheel" pattern?

In this connection and knowledge I, last week, made experiment on paper targets at a distance of 20yds. from the muzzle. The targets were of stout elephant paper with a black bull mark to aim at. There was a strong wind, unfortunately, blowing diagonally toward the gun; out of twelve cylinder consecutive shots the felt wad was driven through the elephant paper target seven times. The hole made by the wad, with in each case its circular impression left on the torn tongue of paper, was, as regards the bull aimed at, thus— 5in., 6in., and 15in. above bull; 7in. below bull; 10in. and 24in. below to right; and 9in. abreast to right. Two of these were almost bare centered cartwheel, and one very patchy; whereas the no-wad targets were good. Now, what could drive a felt wad 20yds. with such comparative accuracy across a strong wind? Gas blast, and perhaps air suction of the shot charge? I had much the same wad hitting in a previous 20yds. trial for patterns, and was not troubling to notice the wad, but the targets show. In those trials where choke barrel was also used there is, so far as I can find, no instance of wad through with choke; probably the check of the wad by the choke held the wad just back of getting the suction pull when the gas had lost its velocity compound to shot. Well, it may be interesting, but not useful.

Now, let us turn to the question of remedy. We must avoid the choke fault of constricting the shot and of creating an unduly full-pelleted center on the pattern, but at the same time we want the check to the wad which choke gives to avoid the gas blast acting unduly upon the rear of the shot and upon the wads, driving them into the shot. Intermediate boring has been proved to hold the faults of choke. Though it gives a wider spread the center is always unduly filled and the outer part starved. Let us examine recess boring (Fig. 3). This was used in the old days of black powder shooting, possibly first as a mere recess, but certainly later and commonly as recess choke. Such a combination was probably very severe on the pellets, and the value of the recess was defeated by the addition of choke. Fig. 3 shows, merely graphically, what I would term recess cylinder boring, with the shot charge leaving the recess, and the felt and card just entering the same. The shot are not constricted, but rather loosened on going through, and the actual muzzle is of the same gauge as the barrel. The felt wad, however, is the important factor; in 3, this wad, owing to the larger gauge of the recess, is being expanded in its diameter by the pressure of the powder gas behind it, and in a moment it will be, as in 3*a*, throttled back again to the original gauge by the front return from recess to the cylinder. This should act upon the wad as would choke boring, and give the wad the required check, which we know frustrates the gas blast from playing havoc with the shot; and yet it should not constrict the shot. The exact amount of recess, in length and gauge, and its position within the muzzle, can only be determined by actual experiment, and I venture to think that the felt wad structure will have an important bearing on results. Probably the loose card now used in front of the felt should be dispensed with, and the felt increased in thickness by one-twelfth an inch, as shown in the sketch, with a glazed thin card for its own front, but it must be capable of compression and so expand in diameter to fit tightly and fill the recess, as otherwise there would be a blow-by of gas, and it will then all the better act as a gas check at the muzzle. The rear card and that over the shot are negligible; they are cartridge requisites.

The action I anticipate from recess cylinder is that the shot not having been constricted more than a shade at front of recess, and not disturbed by gas blast or wad collision, will get a start and travel in a new formation, something between cylinder and choke. Somewhat as in sketch 3*b* the gas blast must of nature overtake, though less violently, and may act upon the shot rear to open the charge evenly in parachute form, and as a consequence probably give a good even spread, filled to about half-choke percentage of total charge. It is as yet mere speculation; even the scientist cannot definitely say, without further experiment, what will result. It may turn out a bad egg, but it is worth opening.

W. BADEN-POWELL.

As a postscript to the above I desire to emphasize that the illustration is not intended to be an actual scale drawing of the various borings of guns, such as the three-thousandths of an inch; they are merely intended to illustrate the form of boring and character of discharge. Also, since the article was in type I have been agreeably surprised by receiving a pamphlet of Mr. W. D. Borland's researches in the photography of flying shot and gas blast, reprinted from Arms and Explosives, in connection with the laboratory of E. C. powder. My amateur deductions from the scant report and four photographs which I had seen previous to writing are entirely borne out in that fuller pamphlet. Where my deductions and conclusions exceed the experts' views, I may be wrong, but if the foundations are sound they may help to stimulate further research leading to useful improvement in the gun of the future.—W. B.-P. in Field, London.

FIG 3. RECESS CYLINDER.

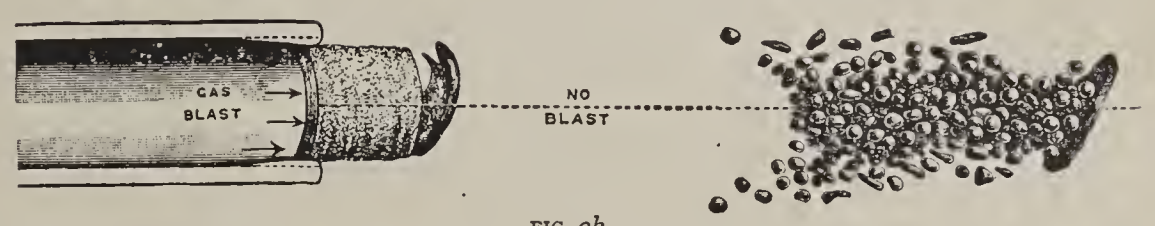

FIG 2*b*.

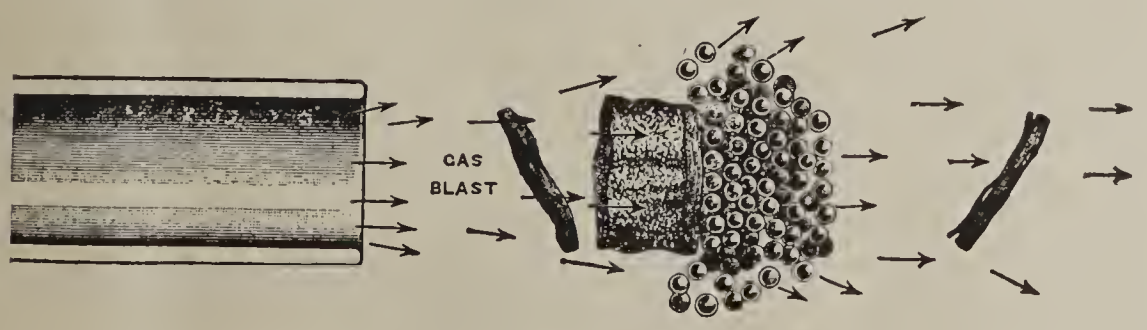

FIG I. TRUE CYLINDER.

Northern Kentucky Gun Club.

DAYTON, Ky.—The club started its series of monthly live-bird matches in January, 1910, and has held one each month, except in July and August, the last one taking place on Dec. 22. The series was open to club members only, and the entrance money was used for the purchase of a suitable trophy for the winner. Eight members entered for the first match. Of these, three have shot in ten matches, one in nine; one in three; one in two; and two dropped out after the initial contest. Taking the total score for the ten matches, 150 targets, Schenck and Gould are tied for high, on 131, Walker 130. Parker killed 121 out of 135 birds in his nine shoots. Gould and Payne each have two perfect scores to their credit, and Walker one. Taking the seven best scores, according to the conditions of the contest, Payne won the trophy with 98 out of 105 birds. Gould gave him a close run, finishone bird behind with 97. Then came Walker and Schreck in order. The scores made in the last match of the series were as follows: Payne 15, Gould 15, Schreck 12, Walker 10. The trophy this year was a very handsome cut-glass vase, and was presented by the winner to Mrs. I. P. Gould, the charming wife of the club's secretary, who has been an interested spectator at every match, and who is by no means a poor shot herself, either at targets or pigeons. Another series will probably be arranged, to start this month.

Monthly live bird trophy shoot, seven best scores; each match at 15 birds:

Payne	13 14 14 15 13 14 15	98
Gould	13 14 13 15 13 13 15	97
Walker	14 13 13 14 13 13 15	95
Schreck	14 13 13 14 13 13 13	93

Western Handicap.

OMAHA, Neb., Jan. 6.—While the western Handicap comes to Omaha this spring, it will not be handled by the time-honored old Omaha Gun Club; the Benson Club, a younger and perchance a bit livelier body, beat them out. The Omaha Club thought as a matter of course, that they would be awarded the classic, and so announced it, but this morning Secretary Lovering, of the Bensons writes me that his club has grabbed the prize. However, Benson is one of our choicest suburbs, and it amounts to the same thing after all. Col. Dan Whitney, one of the moving spirits of this young and flourishing organization, says they intend to make the handicap second to no shoot held in the country; that they have already begun to formulate their plans, and that the event will be staged at their grounds out near Krug Park, some time during early April.

"SEMI-SMOKELESS"

The most remarkable gunpowder ever preduced—it has the cleanliness and velocity of smokeless powders—it throws but little smoke, and is as safe to shoot as black powder.

Peters SEMI-SMOKELESS CARTRIDGES

Used by J. E. Gorman and L. S. Hawxhurst

BROKE ALL PACIFIC COAST RECORDS

In the 1910 Medal Competition of the Golden Gate Rifle and Pistol Club, at the Shellmound Range, San Francisco, distance 50 yards and Standard American Target, with .22 Pistol, Mr. J. E. Gorman made

TEN SCORES OF 98=980, OUT OF A POSSIBLE 1,000—Breaking all Known Records.

During the year Mr. Gorman shot 86 scores, with a general average of 94¾, as follows: ten 98's, thirteen 97's, thirteen 96's, nine 95's, sixteen 94's, eleven 93's, six 92's, six 91's and two 90's,

A TOTAL OF 8149 OUT OF 8600.

In the Bull's Eye Competition at the regular meet of the Shellmound Rifle and Pistol Club, December 4, 1910, Mr. L. S. Hawxhurst broke the Pacific Coast Record with a .22 rifle, scoring 79 bull's eyes out of 81 shots, in which is included a run of

42 CONSECUTIVE 3 in. BULL'S EYES, OFF-HAND, AT 50 YDS.

These Scores were made with PETERS Cartridges, loaded with the famous KING'S SEMI-SMOKELESS POWDER—the kind that holds the World's record, 2481 out of a possible 2500, made by W. A. Tewes, at Grand Rapids, Mich., in 1906.

Philadelphia Trapshooters' League.

PHILADELPHIA, Jan. 7.—In the second series of the Philadelphia Trapshooters' League, shot to-day between different clubs at Holmesburg Junction and Meadow Springs, close competition was the rule. At Holmesburg Junction, the S. S. Whites, the South End Gun Club of Camden, N. J., competed, while at Meadow Springs, the Highland, Meadow Springs and Haddonfield competed. Meadow Springs was out in great force. The Highland Club was high with the excellent total of 444 out of 500. Meadow Springs had a total of 429. Haddonfield, 393. At Holmesburg Junction the South End was first with 436 to the S. S. White's 431. Mink of the Highlanders, and Powers of the South End made 48 each, high individual scores. The standing of the clubs at present is as follows: Highland, 6 points and 896 targets broken; South End, 5 points and 866 targets; S. S. Whites, 5 points and 861 targets; Meadow Springs 3 points and 833 targets; Haddonfield, 3 points and 804 targets. Thus it will be observed that the contest is very close. The scores of the ten high men counted, each club to have as many men as it pleased.

Team race, ten men to a team, 50 targets per man:

Du Pont Gun Club.

WILMINGTON, Del., July 7.—One thousand spectators were present. A special feature was a match between Lester S. German, of Aberdeen, Md., and Linn Worthington, of Rising Sun, Md., at 25 singles and 15 pairs. Worthington led in the single target feature with 24 to 22, but in the doubles, German scored 28 to 15 for his opponent. The totals were as follows: German 50; Worthington 43. Worthington was handicapped by an injured finger.

In a shoot-off to decide ties made in the merchandise event last Saturday, Eugene du Pont with 23 out of 25 won his race in Class A. In Class B G. H. Mitchell was the successful contestant. In the other two classes, ties were not decided, as the breakdown of the traps delayed matters to such an extent that a finish was impossible. These ties will be decided next Saturday.

The event for the afternoon was the "Coleman du Pont merchandise event" for gun club members only. This was contested for by 73 shooters. The prizes were four silver spoons. The results were:

Class A—J. A. McKelvey winner, with 24 out of 25.

Class B—Dr. Bedford and R. P. Choate tied at 16 with L. Evans; R. B. Evans and E. M. Hoopes, Jr., also tied, but were not eligible for the trophy, not being club members.

Class C—O. B. Clark, R. Baily, Willard Kerr and W. S. Simpson, all tied at 13.

Class D—F. H. Megaw tied with W. J. Hartlove at 9. Mr. Hartlove not being a club member and therefore not eligible, the trophy went to Mr. Megaw. All ties will be shot off next Saturday.

In the revolver, pistol and rifle division, considerable interest was manifested in the shooting of Capt. K. K. V. Casey and J. H. Hessian. They were members of the American team of riflemen which represented the United States during the recent Olympic games, and both have made world's records with the military rifle. These scores follow:

Revolver, 50yds., qualification scores: K. K. V. Casey 84, 82, 80, 78, 77, 71; E. G. Askart 83, 83, 74.

Practice scores, 50yds., revolver: T. G. Samworth 58, 56, 46, 41; Fred Whitehead, 26, 25; Williard Young 16, 14, 14, 13.

Qualification scores, 50yds., pistol: J. W. Hessian 88; F. G. Robelen 75, 63, 63; S. J. Neuman 57; W. F. Jensen 48.

Practice scores, pistol, 50yds.: F. A. Wardenburg 46; W. F. Jensen 45, W. B. Cullen 29, John Greene 29, 26.

Qualification scores, 50yds., rifle (.22cal.): William S. Weedon 52.

Rifle practice scores, 50yds. (.22cal.): J. D. Burrell, 56, 41; William S. Weedon 56, 39; L. C. Weldin 54, 43, 36; W. S. Wells 51; Shepard 48; J. L. Birch 47, 43, 26; William Coyne 41; J. E. Miller 40; H. F. Schuler 36, 27, 22 16; W. A. Jordan 36; D. R. Rutter 35; J. C. Brehm 34; John Mulligan 29; Charles McAteer 23, 22, 11; S. B. Scott 31; J. R. Baily 13; W. H. McElwee 8, 7.

In the trapshooting division a number of improvements have been made since last week, and others are contemplated. Contract has been let for the laying of a cinder path from the club house to the roadway, also for a suitable approach with signs indicating entrance to the grounds. An automatic trap of another design will be installed by next Saturday, and with other improvements provided for, the club hopes to be in position to handle the crowds and permit of more shooting.

The interest in the match between German and Worthington was so marked that the club hopes to have several interesting matches among club members and others before long. William M. Foord, of this city, one of the crack amateur shooters in the East may shoot an exhibition race with Charles Newcomb, of Philadelphia. A handsome trophy will be provided for the winner.

Hyde Park Gun Club.

CINCINNATI, O.—Threatening weather and slushy walking cut the attendance down to a very few at the shoot on Jan. 7. Of those who were present, De Mar was high with 46. Wuerdeman is a young shooter and a new member of the club, and this season's practice will undoubtedly improve his work. Murdock is also new at the game and should improve if he sticks at it. Schaefer, the treasurer of the club, is not a very regular attendant at the weekly shoots, which is a pity, as he is a mighty pleasant companion, and practice would put him up among the leaders. Frohliger, Phillips, Rugg and some of the other regulars have been prevented by first-of-the-year business from getting out. The club is planning to give another of its popular special prize events at an early date.

De Mar	23 23—46	Schaefer	17 ..—17
Wuerdeman	13 15—28	Murdock	9 ..— 9

Eagle Gun Club.

MANOA, Pa., Jan. 7.—Fisher and Matson were the only two who scored 10 straight at the club's shoot to-day. Hoffner and Parker tied on 9. The event was a 10-bird handicap. Scores:

American Duck Shooting

By GEORGE BIRD GRINNELL

NO single gunner, however wide his experience, has himself covered the whole broad field of duck shooting, and none knows so much about the sport that there is nothing left for him to learn. Each one may acquire a vast amount of novel information by reading this complete and most interesting book. It describes, with a portrait, every species of duck, goose and swan known to North America; tells of the various methods of capturing each, the guns, ammunition, loads, decoys and boats used in the sport, and gives the best account ever published of the retrieving Chesapeake Bay Dog.

About 600 pages, 58 portraits of fowl, 8 full-page plates, and many vignette head and tail pieces by Wilmot Townsend.

Price, *edition de luxe* on hand made paper, bound in buckram, plates on India tint paper, each copy numbered and signed by author, $5.00. Price, library edition, $3.50.

FOREST AND STREAM PUBLISHING COMPANY
127 Franklin Street, New York

WOODCRAFT

By "Nessmuk." Cloth, 160 pages. Illustrated. Price, $1.00.

A book written for the instruction and guidance of those who go for pleasure to the woods. Its author, having had a great deal of experience in camp life, has succeeded admirably in putting the wisdom so acquired into plain and intelligible English.

FOREST AND STREAM PUBLISHING CO., NEW YORK

YOU know mallards—wisest and wariest of all ducks—Solomons of the air. You can't knock down mallards with a paddle nor can you get them with a gun that plasters its shots all over the face of creation.

A mallard shot is generally a long shot, and long shots require a hard-shooting, close-shooting gun.

That's why the long-headed man who goes to a mallard country takes a Lefever. When he swings it on a towering pair of mallards he does not question the result. He know it—

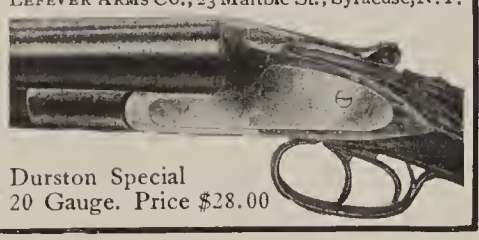
TWO CLEAN KILLS

The reason a Lefever kills clean and sure and far is **Lefever Taper Boring.**

But if you buy a Lefever for the taper boring alone, you will get more than your money's worth. For instance, you will never be handicapped with looseness at the hinge joint. The exclusive Lefever screw compensates for a year's wear by a trifling turn that you make yourself with a screwdriver.

LEFEVER
SHOT GUNS

Sixteen other exclusive Lefever features and Lefever simplicity and strength make the $28 gun the peer of any $50 gun on the market. Upwards to $1,000. Send for free catalog and get Lefever wise.
LEFEVER ARMS CO., 23 Maltbie St., Syracuse, N.Y.



Durston Special
20 Gauge. Price $28.00

American Big Game in its Haunts.

The Book of the Boone and Crockett Club. Editor, George Bird Grinnell. Vignette. New York. 497 pages. Illustrated. Cloth, $2.50.

Contents: Sketch of President Roosevelt; Wilderness Reserve, Theodore Roosevelt; The Zoology of North American Big Game, Arthur Erwin Brown; Big Game Shooting in Alaska—I. Bear Hunting on Kadiak Island; II. Bear Hunting on the Alaska Peninsula; III. My Big Bear of Shuyack; IV. The White Sheep of Kenai Peninsula; V. Hunting the Giant Moose, James H. Kidder; The Kadiak Bear and His Home, W. Lord Smith; The Mountain Sheep and Its Range, George Bird Grinnell; Preservation of the Wild Animals of North America, Henry Fairfield Osborn; Distribution of the Moose, Madison Grant; The Creating of Game Refuges, Alden Sampson; Temiskaming Moose, Paul J. Dashiel; Two Trophies from India, John H. Prentice; Big Game Refuges, Forest Reserves of North America, Forest Reserves as Game Preserves, E. W. Nelson, etc., etc.

FOREST AND STREAM PUBLISHING CO.

The Pistol and Revolver.

By A. L. A. Himmelwright, President U. S. Revolver Association, Director New York State Rifle Association.

A handy pocket-size volume of 157 pages of practical information, covering the entire subject of Pistol and Revolver Shooting. This work is strictly up-to-date, including the latest development in smokeless powder; the 1908 Revolver Regulations and Practice of the United States Army, the United States Navy and the National Guard; the Annual Championship matches and Revised Rules and Regulations of the United States Revolver Association, etc. Besides being a useful, practical handbook for the experienced marksman, the work will also prove particularly valuable for beginners.

Contents: Historical: Arms—Military, Target, Pocket Ammunition; Sights; Position; Target Shooting; Revolver Practice for the Police; Pistol Shooting for Ladies; Clubs and Ranges; Hints to Beginners; Selection of Arms; Manipulation; Position and Aiming; Target Practice; Cleaning and Care of Arms; Reloading Ammunition—primers, shells, bullets, powders, reloading. Appendix—Annual Championship Matches of the U. S. Revolver Association; Rules Governing Matches, etc. Records of the U. S. Revolver Association.

In three styles: Paper, 60 cents. Cloth, $1.00. Full Morocco, $1.50. A liberal discount to military organizations and shooting clubs on orders of ten or more copies.

FOREST AND STREAM PUBLISHING CO.

Where, When and How to Catch Fish on the East Coast of Florida

WHERE, WHEN AND HOW TO CATCH FISH
By Wm. H. Gregg, of St. Louis, Mo., assisted by Capt. John Gardner, of Ponce Park, Mosquito Inlet, Fla. With 100 engravings and 12 colored illustrations. Cloth. Illustrated. 238 pages. Map. Price, $4.00.

A visitor to Florida can hardly make the trip without this book, if he is at all interested in angling. It gives a very complete list of the fishes of the East Coast of Florida, and every species is illustrated by a cut taken from the best authorities. The cuts are thus of the most value to the angler who desires to identify the fish he takes, while the colored plates of the tropical fish shown in all their wonderful gorgeousness of coloring, are very beautiful. Besides the pictures of fish, there are cuts showing portions of the fishing tackle, which the author uses. A good index completes the volume.

FOREST AND STREAM PUBLISHING CO.

Uncle Lisha's Shop.

Life in a Corner of Yankeeland. By Rowland E. Robinson. Cloth. 187 pages. Price, $1.25.

The shop itself, the place of business of Uncle Lisha Peggs, bootmaker and repairer, was a sort of sportsman's exchange, where, as one of the fraternity expressed it, the hunters and fishermen of the widely scattered neighborhood used to meet of evenings and dull outdoor days "to swap lies."

FOREST AND STREAM PUBLISHING CO.

The Story of the Indian.

By George Bird Grinnell, author of "Pawnee Hero Stories," "Blackfoot Lodge Tales," etc. 12mo. Cloth. Price, $1.50.

Contents: His Home. Recreations. A Marriage. Subsistence. His Hunting. The War Trail. Fortunes of War. Prairie Battlefields. Implements and Industries. Man and Nature. His Creation. The World of the Dead. Pawnee Religion. The Old Faith and the New. The Coming of the White Man. The North Americans—Yesterday and To-day.

New York Athletic Club.

TRAVERS ISLAND, N. Y., Jan. 7.—The weather was pleasant, a clear winter day. Ties were not so numerous on account of changes in the handicaps. Dr. Culver, A. W. Church, F. A. Schauffler, Dr. Browne were scratch men. Dr. De Wolfe scored a leg on the Haslin cup with 25, Dr. Browne duplicated the performance for the January cup, while T. Lenane, Jr., for the tournament cup scored a leg after a shoot-off of a tie on 24 with Ogden, Billings and Lembeck. He scored 25 straight. Minford won the challenge round, 24 to 21. E. M. Higginson won the club special with a full score. A new shooting committee was elected.

Crescent Athletic Club.

BAY RIDGE, L. I., Jan. 7.—The delightful weather favored good scoring at the Bay Ridge traps of the Crescent Athletic Club to-day, and as a consequence ties were numerous. For the January cup, A. Corlies was high alone with 24, and he also scored a leg on the James cup after shooting off a tie on 25 with F. S. Hyatt, H. B. Vanderveer, D. T. Leahy and C. A. Lockwood; Corlies scored 24 in the shoot-off. For the Lockwood trophy, F. B. Stephenson, R. E. Fox and H. B. Vandervcer tied on 25, Stephenson winning in the shoot-off. Five tied on 25 for the James trophy.

The final shoot for the Brower trophy was an interesting feature. On New Year's day of 1910, this cup started as an object of competition. The contestants were paired, and the defeated brace mate was out of the competition. This was continued till the winner was determined. It is a most unfair method of settling a contest, as a contestant defeated in the first series may score higher than the final winner. C. Ferguson was a guest of the club. The scores:

Brower trophy, 25 targets, handicap:

First round—F. B. Stephenson (0) defeated G. H. Piercy (0) by 24 to 23; A. Hendrickson (2) defeated H. W. Woodcock (2), 22 to 21; M. Steiner (1), defeated F. J. James (1) by 24 to 21; J. P. Fairchild (1), defeated W. W. Peabody (2), by 25 to 24; F. S. Hyatt (3) defeated C. R. James (2) by 25 to 24; Dr. Williams (4) defeated J. S. Lawson (5), by 24 to 23; C. H. Pulis (3) defeated G. W. Felix (2), by 25 to 24, and A. S. Trippe drew a bye.

Second round—F. B. Stephenson (0) defeated A. E. Hendrickson (2), by 24 to 21; J. P. Fairchild (1) defeated M. Stiner (1) by 25 to 24; F. S. Hyatt (3) defeated Dr. R. C. Williams (4), by 24 to 21, and A. S. Trippe (3) defeated C. H. Pulis (3) by 25 to 21.

Third round—F. B. Stephenson (0) defeated J. P. Fairchild (1) by 25 to 24, and F. S. Hyatt (3) defeated A. S. Trippe (3) by 23 to 21.

Final round—F. S. Stephenson (0) tied with F. S. Hyatt (3) at 24.

Shoot-off: F. S. Hyatt (2) defeated F. B. Stephenson (0), by 25 to 23 targets.

Trophy shoot, 25 targets, handicap:

The "Old Reliable" PARKER GUN

Wins for the **EIGHTH** Time

The Grand American Handicap

Score of 100 Straight from 19 Yards.

At Chicago, Ill., June 23, 1910.

Mr. Riley Thompson, of Cainsville, Mo., made this record, which has never before been equaled in this classic event.

The **Parker Gun,** in the hands of Mr. Guy V. Dering, also won the Amateur Championship at Chicago, June 24, scoring 189 ex 200, shooting at 160 singles and 20 doubles.

The Prize Winners and Champions shoot **The PARKER GUN!**

Why Don't You Reload Your Shells?

You must know that the empty shells represent a very big part of the expense of factory ammunition.

Do you know that by reloading your shells you can not only save money by reducing your shooting expense, but also do better shooting with less wear on your gun?

Rifle and pistol cartridges can be reloaded from 10 to 30 times each with entire success. This means a very big saving for any man who loves to shoot. Even if you use a high-power, big-game rifle, you can produce your own high power cartridges with hard or soft point bullets, with all the range and power of the factory ammunition, greater accuracy and with less wear on the barrel of your rifle. You can also load your cartridges with medium or short range loads, varying the range and power to suit the conditions.

Shotgun shells can be very successfully reloaded two or three times each. A loading outfit costs very little, and you can then load as few or as many shells as you wish with just the right loads for the occasion. Every gun club should have an Ideal loading machine. Ask for our free booklet "Hints on Reloading Shotgun Shells".

The Ideal Hand Book contains 140 pages of practical information regarding all American rifles, shotguns and pistols and the proper ammunition for use in them. It tells how bullet moulds are made—how to cast your bullets and reload your shells. Sent free to any shooter for three stamps postage by

THE NARRATIVE OF A SPORTSMAN

INTER-OCEAN HUNTING TALES

EDGAR F. RANDOLPH

A series of hunting reminiscences of rare charm for the sportsman and for the wider circle which delights in true tales of outdoor life. With none of the high coloring and exaggeration which give a false note to so many hunting stories, Mr. Randolph's book is never lacking in interest.

He covers the field of sport with the rifle, east and west, drawing a vivid word picture of life in the open, subordinating his own exploits to the main incidents of outdoor experience, giving much valuable information on camp life, hunting and the habits of wild game, and continually delighting the reader with the freshness of his viewpoint.

This book will strike a sympathetic chord in the memory of every big-game hunter of experience and will prove of real value to the novice who is planning an excursion into the wild.

Cloth, 170 Pages. Richly Illustrated. Postpaid, $1.00.

Rhymes of The Stream and Forest

FRANK MERTON BUCKLAND

One of the freshest, most delightful collections of outdoor verse offered for many a day. They are the outpourings of a spirit which loves nature, the woods and streams and growing things, and appreciates its charms.

Mr. Buckland's verse has a charm that is at once rare and delightful. This book will appeal to every outdoor man or woman, and particularly to the "Brethren of the Angle."

Its form is as attractive as its pages, closely simulating the appearance of the standard fly-book, printed on heavy laid paper with ornamental border designs of trout flies, pocket for clippings, and blank pages for copying or individual composition. It is just the thing for the den, for the pocket, or for a gift to the friend who loves the big world out of doors.

Fixtures.

Jan. 30—Feb. 4.—Indoor .22-Caliber League of the U. S., 671 Bushwick avenue, Brooklyn, N. Y. Arthur Hubalek, Sec'y.

March 11-18.—Fifteenth annual championship under auspices of Zettler Rifle Club, 159 W. 23d St., New York.

Cincinnati Police Revolver Club.

THE first match in the series for the rifle, donated to the club by Rall-Crawford-Brandemour, was shot at the City Hall range on Jan. 6. The match conditions are 20 shots slow fire, and 5 shots rapid fire, 20 seconds, a total of 25 shots with a possible total of 250 points. The trophy must be won three times in order to become individual property. In the slow fire rounds, Curlis did some fine work. His first ten shots were, with one exception, all in the black, only two of these being in the 8-ring; a total of 89. Of the 20 shots, he put 16 in the black. He lost the range in his third round, starting in with a 5, but worked up to the center, finishing the round with two 10s, and put his last round all in the black. He was high with a total of 170. In the rapid fire round he fell down, but still won the match with 194.

Sergt. Williams and R. Ruck tied for second on 153. Sergt. Palmer was third with 152. Ruck and A. Moore tied for high score in the rapid fire with 33 each. Sergt. Palmer was second with 31. Ruck was second high in the match with 186. Sergt Palmer, 183.

The next match will be held on the first Friday in February. The club team meets the First Regiment team in the League series on Jan. 13 at the City Hall range.

Club trophy contest, 20 shots, slow fire, and 5 shots rapid fire (20 seconds); possible 250 points; 20yds; standard American target; .38 caliber revolvers, full service ammunition:

Rifle League Scores.

WASHINGTON, Jan. 7.—Results of the third week's contest in the Eastern Inter-Club Rifle Shooting League, to determine the contestant of the league which will shoot against the Western League's winning team, were as follows:

New Haven, Conn., won from South Providence, R. I., 984 to 894; Butler, Pa., won from Savannah, Ga., 891 to 778; Bangor, Me., won from Birmingham, Ala., 950 to 943; Washington, D. C., won from Erie, Pa., 895 to 894; Bridgeport, Conn., won from Atlantic City, 923 to 774; New York City won from Portland, Me., 981 to 963, and Warren, Pa., won from Pittsburg, Pa., 955 to 950.

The leading clubs of the Eastern League with this week's results are New Haven, Butler, Bridgeport and Warren, each with three victories and no defeats.

Minneapolis, Minn., Jan. 7.—The second week of shooting in the Western Division of the National Rifle Association Inter-Club Indoor Rifle League leaves St. Paul, Butte and Pasadena, Cal., standing at the head of the list of twelve clubs with two matches won and none lost. The score of the week's match as reported to division headquarters in Minneapolis is as follows: St. Paul, 968, vs. Dickinson, N. D., 952; Butte, Mont., 952, vs. Tacoma, Wash., 893; Seattle, Wash., 892, vs. Los Angeles, Cal., 773; Pasadena, Cal., 926, vs. Minneapolis, Minn., 914; Cleveland, Ohio, 881, vs. Adrian, Mich., 835; Pasadena, Cal., 906, vs. Milwaukee, Wis., 890, and Los Angeles, Cal., 791, vs. Santa Ana, Cal. ——.

Zettler Rifle Club.

THE scores of the Zettler Rifle Club, shot on Jan. 3, are as follows:

PUBLISHERS' DEPARTMENT.

This week, in our advertising columns, attention is called to Dr. Cecil French's Vermicide Capsules, the merits of which are briefly set forth therein. A free booklet on "Intestinal Worms In Dogs" will be mailed to all applicants by Dr. Cecil French, 18 French Building, Washington, D. C.

CODFISH AND WATER RATS.

I HAVE recently had positive proof of the codfish of the M'Intyre preying on water rats, says a correspondent of the Sydney (N. S. W.) Mail. I caught a large cod weighing 58½ pounds. In its gullet, swallowed, or half-swallowed, head foremost, was one of the largest water rats I have seen. It had evidently been not long taken by the fish, as it was perfectly fresh. I think, when living about the head-streams of the large holes in this river, a large number of rats are devoured by the fish. The blood veins on the skin of the air-bladder in the codfish bear a remarkable resemblance to the form of trees. Some people believe that it is a true reflection of the trees on the bank above, where the spawn is deposited. However, I have taken a good many out, for curiosity, and have never got two alike.

ANGLING MEMORIES

Seasonable Books for the Sportsman's Library

MEN I HAVE FISHED WITH — **MY ANGLING FRIENDS**

Both by FRED MATHER

These two volumes are a source of endless delight to the fisherman. They deal with every phase of the gentle sport from bent pins and willow poles to salmon flies and special rods—with every kind of fish as well.

They are full of a quaint philosophy, written with a rare appreciation of human nature, and comprising sketches of angling "characters" as well as well-known men who were Mr. Mather's brethren of the angle. Much of other sport and adventure beside fishing will be found between the covers of these books. These two large, splendidly bound, splendidly printed, and richly illustrated volumes of 400 pages each regularly sell for $2 each. While they last we offer

Both together, postpaid, for $3.00

A Classic for Sportsmen

AMERICAN BIG GAME IN ITS HAUNTS

Boone and Crockett Club Series

Edited by GEORGE BIRD GRINNELL

An invaluable work not alone for the sportsman, but for the student and lover of wild life. Treats of big game preservation and protection in the broader sense; tells of the habits, habitat and life history of the larger wild animals; touches upon the problem of the public forest domain, and is rounded out by interesting hunting reminiscences by such leaders in the fraternity of big-game hunters as Madison Grant, Paul J. Dashiell, George Bird Grinnell, Jas. H. Kidder and W. Lord Smith. Bound in cloth, library edition, heavy paper, richly illustrated, 497 pages.

Postpaid, $2.50

Sam Lovel's Boy.

By Rowland E. Robinson. Price, $1.25.

Sam Lovels' Boy is the fifth of the series of Danvis books. No one has pictured the New Englander with so much insight as has Mr. Robinson. Sam Lovel and Huldah are two of the characters of the earlier books in the series, and the boy is young Sam, their son, who grows up under the tuition of the coterie of friends that we know so well, becomes a man just at the time of the Civil War, and carries a musket in defense of what he believes to be the right.

FOREST AND STREAM PUBLISHING CO.

The Indians of To-day.

By George Bird Grinnell. Demi-quarto, 185 pages, buckram. Price, $5.00.

It describes the old-time Indian and the Indian of to-day, and contrasts the primitive conditions and ways of living with those of the present. It contains over fifty full-page portraits of living Indians from photographs.

Contents: The North American Indians. Indian Character. Beliefs and Stories. The Young Dogs' Dance. The Buffalo Wife. A Blackfoot Sun and Moon Myth. Former Distribution of the Indians. The Reservation. Life on the Reservation. The Agent's Rule. Education. Some Difficulties. The Red Man and the White.

FOREST AND STREAM PUBLISHING CO.

Nursing vs. Dosing.

A Treatise on the Care of Dogs in Health and Disease. By S. T. Hammond ("Shadow"), Author of "Training vs. Breaking." 161 pages. Cloth. Price, $1.00.

Mr. Hammond believes that more dogs are killed by injudicious doctoring than by disease, and the present work is a protest against the too free use of medicine when dogs are sick. The author has given especial attention to many of the troubles which especially afflict small dogs kept in the house, and likely to suffer from lack of exercise and from over-feeding; and boys and girls owning dogs—as well as children of larger growth—may profitably study and ponder this volume.

Contents: Importance of Nursing. Cleanliness. Out-of-Sorts Dam. Puppies. Diet. Other Foods. Kennel and Exercise. Common Ailments. Teething. Diarrhea. Convulsions. Epilepsy. Distemper. Eczema. Need of Proper Care. Sour Stomach. Vermin. Canker of the Ear. Mange. The Nervous System. Abscesses. Colic. Worms.

FOREST AND STREAM PUBLISHING CO.

A Problem's Solution

LOG CABINS & COTTAGES; How to Build and Furnish Them.

A seasonable book when all minds are bent on the problem of getting close to nature. Mr. Wicks in this delightful book offers timely advice to every one who wants to build a simple summer home at one with its surroundings of wood or stream or shore.

This is a thoroughly practical work, treating of the how, the where, and the with what of camp building and furnishing. It is helpful, too, in regard to furnishing, and withal a most beautiful work.

Cloth, profusely illustrated, $1.50 postpaid.

FOREST AND STREAM PUBLISHING CO.

His Best Book

MY FRIEND THE PARTRIDGE

By S. T. HAMMOND

This delightful presentment of the glories of Autumn days with gun and dog in the crisp New England woods in search of the noblest of native game birds, which has already delighted thousands of readers of FOREST AND STREAM, is now ready for delivery in book form.

Mr. Hammond knows his upland coverts as no other writer of the day. He makes no empty boast when he calls the partridge his friend, and, moreover, makes his every reader a friend of this splendid bird. He succeeds in a rare degree, not only in describing the ruffed grouse, its habits and habitat, and the pleasures of its pursuit, but in surrounding his reader with the very atmosphere of the leaf-scented Autumn woods. Mr. Hammond's book is a welcome addition to the library of sport.

Cloth. 150 Pages. Illustrated. Postpaid, $1.00

FOREST AND STREAM PUBLISHING CO., 127 Franklin Street, NEW YORK CITY

PLANNING A HOUSEBOAT

Will be a leisure-hour occupation in many a family this winter. Houseboating has come among us to stay, and promises to be even more popular than in England itself. Every one who is interested in houseboats or who contemplates taking up this feature of outdoor life, should read Mr. Albert Bradlee Hunt's practical, and, at the same time, beautiful work on the houseboat and its adaptation to American waters.

HOUSEBOATS AND HOUSEBOATING

Covers the entire range of its title, considers the use and opportunities of the houseboat; their relation to city and suburban life; construction, furnishing, motive power, and all the thousand and one details, the knowledge of which spells the difference between success and failure in houseboat building and houseboat life.

Details, plans, drawings and specifications illuminate the text, while life on houseboats is interestingly described. Some of the more noted English and American houseboats and the life thereon are also described at length with illustrations. Buckram, heavy paper, sumptuously illustrated.

Postpaid, $3.34

FOREST AND STREAM PUBLISHING CO., 127 Franklin Street, NEW YORK CITY

AMERICAN BIG-GAME HUNTING

BOONE AND CROCKETT CLUB SERIES

Edited by George Bird Grinnell and Theodore Roosevelt

A thoroughly stimulating book dealing with American big-game hunting, East, West and under the Arctic circle, including every phase of sport with the rifle. "American Big-Game Hunting" is a compilation of the experiences of some of the most widely known sportsmen in America. Among the sketches are: The Story of the Buffalo, Capt. Geo. S. Anderson; The White Goat and His Country, Owen Wister; Old Times in the Black Hills, Gen. Roger D. Williams; Coursing the Pronghorn, Theodore Roosevelt; After Wapiti in Wyoming, F. C. Crocker; In Buffalo Days, George Bird Grinnell; Blacktails in the Bad Lands, B. Rumsey.

Forest Preserves and Game Refuges are also considered. Aside from the surpassing interest of the narratives, the book is invaluable for referenc. Cloth, heavy paper, library edition, richly illustrated.

Postpaid, $2.50

FOREST AND STREAM PUBLISHING CO., 127 Franklin Street, NEW YORK CITY

GUNNER GUMPTION'S
LANTERN LECTURETTES ON

GREENER GUNS

The Greener Treble Wedge Fast Action.— Many methods of uniting the top of the standing Breech and upper portion of the gun barrels have been introduced, but none are so strong and thorough as the Greener Treble Wedge Fast Cross Bolt, which has been proved by actual experiment to add enormously to the safety and wear of a gun.

At the famous London *Field* explosive trials of 1878, a special experimental gun was prepared by the editor of the *Field*, and the following extracts from his report are a remarkable testimony to the strength and efficiency of this device.

"to this action we had a little apparatus fixed as shown in this sketch, by this arrangement a piece of silver paper can be strained between the hook and the screw clip, attached to the barrels so that when any separation takes place during an explosion the paper breaks. We found that in Mr Greener's action no breakage occurred, using any charge of powder which the cartridge case could be made to hold with the bolt in position the paper remained intact up to the last"

In these experiments a charge of 65 grains of Schultze powder and 2 ounces of shot was used without causing the breech to "give" in the slightest degree

See that your new gun carries the Greener guarantee—Life-long satisfaction.

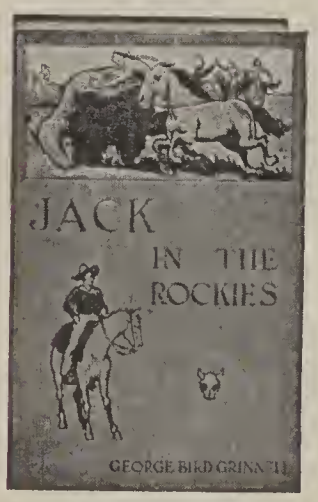
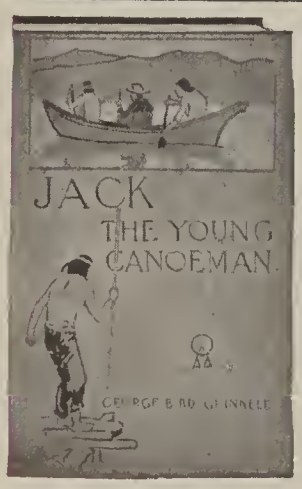
THE JACK SERIES





Best Books For Boys

By GEORGE BIRD GRINNELL

THE solution of the parents' problem of providing for the growing boy reading at once healthy and satisfying to his craving for action and adventure. In the Jack Books the longing of the normal boy for Western stories is gratified, the interest is absorbed and the mind is unconsciously led to phases of life that are elevating and instructive.

The books are the story of a young New York lad, sent to Stillwater ranch in the Rockies for his health, who becomes the companion of a veteran of the frontier. For each of six succeeding years he is led through new territory and experiences, accumulating much of the lore of plain and mountain, enriched with tales of the old West.

Ranch life, travel and hunting on the lonely plains, Indian camps, mountain climbing, trapping and canoeing are described. There is not a dull page, and the author manages to put much of the spirit of the West into his books. Jack is a real boy, and the books are stories for live boys—not lectures in disguise.

FOREST AND STREAM PUBLISHING COMPANY

PHOTOGRAPHY AS A PASTIME.

WITH the advent of the falling autumnal leaf the peregrinations of the amateur photographer, as he pushes his way through the trackless avenues of nature, become invested with surpassing interest, said a correspondent to FOREST AND STREAM of Dec. 12, 1889. When old Mother Earth begins to robe herself in the cerements of crimson and yellow and the grand old forests drop upon her bosom the brown garments of decay, it is then that the knight of the tripod is in his glory.

The wonderful growth of amateur photography as a popular outdoor pastime illustrates in a marked degree the elevating tendencies of the modern devices for health-giving recreation. To the lover of those polite diversions that are devoid of the elements of daring adventure and the prowess of reckless exposure the study of field photography presents attractions that are incomparably superior to those of other outdoor pastimes.

Photography enjoys an acknowledged supremacy over all other outdoor sports in that it cultivates the finer instincts and depends not for its fascinating features upon any exhibition of physical hardihood or athletic training. The pursuit of the pastime is beyond question ennobling and refining in its influence. It develops a keen and artistic eye for the beautiful in nature. Through the mystic and enchanting alchemy of the dark room, it brings the receptive mind into close contact with the great Artist who has filled the earth and sky which such regal beauty.

The whole realm of nature with its green fields and woodland symposium of daisies and buttercups, its babbling brooks, where the laughing rivulets go clattering with their silver heels over the stony depths and the nodding lilies drink in copious libations from the perpetual fount—all this is the kingdom of the amateur photographer.

The pastime is one that not only conduces to physical exhilaration, but, through the fascinating mystery of its results, it engages our admiration and enlists our ripest mental endeavor. Other outdoor sports are largely calculated for the development of the body without rendering to the mind any adequate recompense. Moreover, such pastimes as hunting, fishing, lawn tennis and baseball combine elements of roughness that are incompatible with the refined delicacy of the gentler sex. Photography is a recreation admirably adapted to both sexes.

Those who imagine that outdoor photography is a mere sport are laboring under a lamentable misapprehension of the scope of this delectable diversion. Photography is a study; and to that fact it is indebted in a large measure for many of its elements of irresistible charm. Pure physical exercise is not satisfying to the cultivated mind. The pastime that makes only brawn and muscle does not adequately fulfill the requirements of a perfect ideal American pastime.

To the young man or young woman who seeks mere sport, photography will be a vexatious disappointment. Its tedious details cannot be mastered in one summer. To the patient student who is willing to give to it a fair allowance of time and study it has a fund of pleasure that is constant and exhaustless.

He who is gifted by nature with an instinct for discerning the beautiful and is endowed with some inventive faculty, will find the rarest enjoyment in photography. No lunkhead ever made a success of it or thoroughly enjoyed it. Not every one who can wield a lawn-tennis racquet can develop a good negative or make a perfect exposure.

Those who contemplate joining the grand army of amateur photographers should be admonished that the only true satisfaction is to be derived from a camera that has been made for the professional artist. The average "amateur outfit" is to be abhorred by those who would be *en rapport* with the beautiful art. If you want a camera it is advisable to go or send to a photographic stock house and purchase a good instrument that will be a constant source

American Game Bird Shooting

By George Bird Grinnell

This new book covers the whole field of upland shooting in America as this field has never before been covered, and is intensely interesting and useful to everyone who uses the shotgun. It deals with the birds followed with dog and gun by the upland shooter, and describes the habits of the woodcock, snipe, all the North American quail, all the grouse and the wild turkeys.

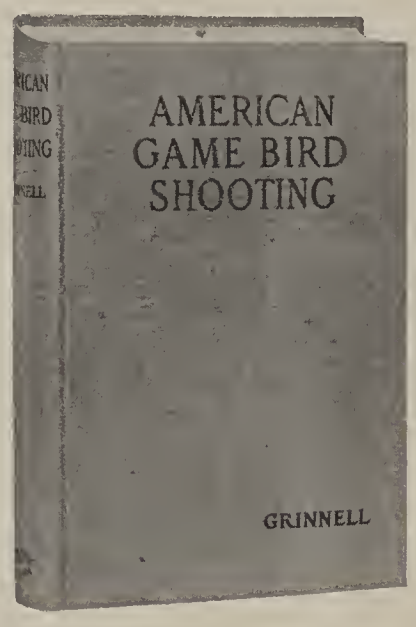
The completion of this book was a large task, requiring exceptional qualifications, knowledge and experience, and was never before accomplished by any other author.

It is the companion volume to Mr. Grinnell's book, "American Duck Shooting." Thus the two books cover the entire field of game birds taken with the shotgun, with complete description of their natural history features.

"A very complete monograph for sportsmen and naturalists....with anecdotes, of his own and others....the book will be enjoyed not only by sportsmen but by the general reader."
—The Sun, New York.

"An important, thoroughly reliable and well written book; a work that will be read with interest and pleasure by sportsmen. The work is the first complete one of its kind."
—The Boston Globe.

"No book as good as this on the subject treated, nor so fully covering the field, has been produced." **—The Salt Lake Tribune.**



"This volume is especially welcome—a treat to every man who loves to tramp the uplands with dog and gun." **—Inter-Ocean, Chicago.**

"Each bird is taken up in turn, the best methods to hunt, the selection of guns and loads, clothing and dogs are set forth simply and fully."
—Baltimore American.

"It is, I think, a model of what such a book should be—but so seldom is. It is, indeed, much more than a treatise on field sports, for it furnishes such full and excellent life histories of the birds of which it treats that it should find a place in every library devoted to pure ornithology."
—William Brewster, Cambridge, Mass.

PART I. Describes in detail the ways of life of all the American Game Birds; woodcock, snipe, bobwhite, mountain quail, California quail, Gambel's quail, scaled quail and Mearn's quail; dusky grouse, Franklin's grouse, Canada grouse, ruffed grouse, all the ptarmigan, pinnated grouse, sharp tail grouse and sage grouse, and the wild turkeys.

PART II. Is devoted to upland shooting. Here are described at length and in detail all the various methods of taking all the birds mentioned above, and the various aids to shooting, such as guns and loads, dogs and clothing.

PART III. Deals with the shooting of the past and future; tells of the efforts to introduce foreign and native game birds to restock our covers, and of the successful attempts by Dr. Clinton F. Hodge to rear in captivity the ruffed grouse and bobwhite.

The volume is handsomely illustrated. There are colored plates of the ruffed grouse and the quail, made by America's greatest bird painter, Louis Agassiz Fuertes, and 48 other full page plates, most of them photographs from life, showing portraits of different species of birds and interesting shooting scenes. In the text are a number of useful and interesting line cuts. Everyone who delights in the outdoor life and rejoices in tramping the field and woods with dog and gun should possess this handsome volume, which speaks the final word on upland shooting, as its predecessor in this field did on wildfowl shooting.

Cloth. About 575 pages. Price $3.50 net. Postage 25 cents.

Uncle Lisha's Shop.

Life in a Corner of Yankeeland. By Rowland E. Robinson. Cloth. 187 pages. Price, $1.25.

The shop itself, the place of business of Uncle Lisha Peggs, bootmaker and repairer, was a sort of sportsman's exchange, where, as one of the fraternity expressed it, the hunters and fishermen of the widely scattered neighborhood used to meet of evenings and dull outdoor days "to swap lies."

THE CROSBY FRISIAN FUR COMPANY,

584 Lyell Avenue - - Rochester, N. Y.

of pleasure. If you have fifty dollars to invest put twenty-five of it in a lens. The remaining twenty-five can be judiciously expended in a box, tripod and plate-holders. A good formula for developing the negatives may be obtained of any local photographer. It is not advisable to purchase a box that is embellished with complicated mechanisms that are constantly getting out of order.

After all, the excellence of the results accomplished are dependent upon the skill of the artist. The time of the exposure must be regulated according to the light and the character of the subject. To make indiscriminate "shots" at all sorts of objects is the pastime of the schoolboy and not of the artist. The most beautiful effects are obtained by a proper study of the lights and shadows of the landscape, coupled with a skillful exposure of such duration as is best calculated to draw out all the beauties of the scene. The dark foliage of trees will require a longer exposure than a house that has been painted white. And in this connection it is proper to remark that the most inane and insipid feature of the pastime is the photography of houses. No artist who is in love with the art will waste any of his precious negatives upon houses, except, perchance, those that are singularly beautiful and rustic in their architectural conception.

Landscapes constitute the poetry of photography. They make up the rhythmic beauty of the photographic melody. A proper appreciation of the art is predicted upon the delicate impressionableness of the artist with reference to natural scenery.

The Angler's Workshop

RODMAKING FOR BEGINNERS

By PERRY D. FRAZER

A unique work, bringing the science of rodmaking up to the very moment and epitomizing the knowledge and the experience of experts for the guidance of the average man. The evolution of bait-casting principles has made Mr. Frazer's book supersede all previous publications on the subject.

Every angler—young or old—who is fond of adapting his rods and tackle to his own ideas of what they should be, will find in this book a large fund of information gathered by the author in years of study, experiment and practical experience in fishing, tournament casting and at the work bench. He theorizes and speculates not at all. He tells "the how" of everything connected with rodmaking in a way that makes results certain. All explanations are simple and easily followed.

Separate chapters are devoted to each of a half dozen types of bait-casting rods; to tarpon, surf and light salt water rods; bass and trout, salmon and tournament fly-rods. Complete specifications of well known types are given, and the chapter on split bamboo rodmaking is the most comprehensive treatise on the subject ever published. Indispensable in the angler's library.

Cloth, 180 pages, four full-page illustrations, 60 working drawings, making plain every feature of the text. Postpaid, $1.

FOREST AND STREAM PUBLISHING CO., 127 Franklin Street, NEW YORK CITY

The Game Book

STANDARD BIG GAME MEASUREMENTS

Every man wants to compare his trophy with those of other big-game hunters. But comparisons are useless unless there is a fixed standard.

The game book of the Boone and Crockett Club, the foremost organization of hunters of American big-game supplies this. Compiled by J. H. Kidder, it provides directions for standard measurements of the large game animals of America, with spaces carefully arranged for complete data regarding the kill, locality, time, conditions, etc.

It is handsomely and durably bound pocket size. It is an invaluable record for every man who goes into the wild for sport with the rifle, a handy book, a camp companion, and a library reminder of days afield. Leather,

JOSEPH DIXON CRUCIBLE CO. JERSEY CITY, N. J.

Where, When and How to Catch Fish on the East Coast of Florida

By Wm. H. Gregg, of St. Louis, Mo., assisted by Capt. John Gardner, of Ponce Park, Mosquito Inlet, Fla. With 100 engravings and 12 colored illustrations. Cloth. Illustrated. 238 pages. Map. Price, $4.00.

A visitor to Florida can hardly make the trip without this book, if he is at all interested in angling. It gives a very complete list of the fishes of the East Coast of Florida, and every species is illustrated by a cut taken from the best authorities. The cuts are thus of the most value to the angler who desires to identify the fish he takes, while the colored plates of the tropical fish shown in all their wonderful gorgeousness of coloring, are very beautiful. Besides the pictures of fish, there are cuts showing portions of the fishing tackle, which the author uses. A good index completes the volume.

—FOREST AND STREAM, Aug. 14, 1873.

AEROPLANE AND SHOOTING.

A FEW weeks ago we made jocular allusion to the report that Hubert Latham, the famous aviator, had pursued and shot at wildfowl while flying in his monoplane over the grounds of the Bolsa Chica Gun Club in Southern California. He fired ten shots, we are told, killed at least one bluebill, and caused a widespread duck panic over the contiguous marshes. This unprecedented occurrence has had such wide newspaper currency that it seems necessary to comment on it again in serious vein.

However thoughtless and innocent of wrong intent the act may have been, it was most unsportsmanlike, for no more destructive practices in relation to the preservation of wildfowl could be imagined.

In many States the game laws prohibit the use of the motorboat and sailboat in the pursuit of wildfowl, yet Latham used a machine a thousand times more effective in thoroughly frightening the wildfowl and driving them from their resorts. The killing of any number of ducks is insignificant in comparison with the evils sure to follow from the terror wrought by such a harmful innovation. All wild creatures being very susceptible to panic are likely to desert permanently a region where they are constantly subjected to frightful alarms.

The gun club, whose guest Latham was, may reasonably be assumed to be the chief offender in this matter, for that he broke the game laws or took the initiative in this duck chasing without the assent of the club is hardly to be supposed. As an alien, Latham might plead ignorance in extenuation of his act, but it is difficult to conceive of any reasonable plea which the gun club could offer by way of justification.

It is not surprising that public sentiment in California should now be opposed to the use of air craft for shooting purposes. Within a fortnight of Latham's running amuck among the ducks, the California Game Commission appealed to the Legislature to enact a law prohibiting the use of air craft for hunting purposes. It is safe to predict that prompt and favorable action will be taken in response to this request, and the matter may well be considered by all other States.

WILDFOWL, 1910.

IN many of the States the wildfowl season has ended, and in none will it last much longer.

All reports received about the shooting agree that the season has not been a good one, and that the crop of ducks has been short. Many gunners of wide experience believe that but few young ducks were bred during the season of 1910. These opinions are based in part on an examination of the bags made, which gunners declare contain very few young birds. Besides this, during the whole shooting season, the birds have been wild. Instead of being gentle and unsuspicious, as fowl usually are at the opening of the season, these birds were shy and declined to come up to decoys without a careful inspection of the surrounding territory. They seemed to act, in other words, as if they were old birds which had passed through one or two shooting seasons, and this fall were making use of the experience acquired during previous years.

Added to this wariness, and making the shooting still less successful than last year, was the carrying further of a habit of the wildfowl not altogether new. This year, on certain sea coast waters, the ducks, geese and swans have more than ever shown a tendency to leave their feeding grounds soon after daylight, and to spend the day at sea, not returning to the shoal water feeding grounds until after the sun has set—in other words, until after the law forbids shooting. This practice has been reported from a number of localities—on the Great South Bay of Long Island, on some of the broadwaters of Virginia, on Back Bay, in Currituck Sound and at various points in California. This habit puts an end to all shooting, except on days when the weather is so tempestuous as to cause the ocean to be too rough for the ducks to rest on it in comfort.

On most inland waters conditions such as this do not exist, although during the past season they were observed on some of the Great Lakes, making the shooting at some of the clubs there much less successful than usual.

This habit—the effort of the birds to escape the gunners who occupy the shooting grounds during the daylight hours—results in much lighter bags for the season and may become an important factor in wildfowl conservation.

THROUGH the invention of a Swede it is possible that in time the pollution of streams by paper mill waste will be reduced materially. Consul-General Winslow, of Stockholm, reports that a Swedish company there is now making ethyl alcohol from lixivium of sulphite. The invention will enable the refuse of paper mills to be utilized and the sulphite waste, heretofore thrown away and which polluted streams, can now be turned into a profitable by-product. The invention is patented here and abroad.

GOPHERS AND CATS.

NEWSPAPER reports tell of a man in the State of Washington, who is about to purchase in Pennsylvania several thousand domestic cats, ship them to Okanagan county, Washington, and through their activities attempt the extermination of the gophers which are so injurious to the farming interests of that county.

The Washington enthusiast is ignorant of, or has forgotten, the bitter regrets felt by communities, islands and continents where for various reasons foreign animals or birds have been introduced. Classic examples of this are found in the English sparrow in North America, the mongoose in some West India islands and the European rabbit in Australia. Very likely he is also ignorant of, or has forgotten, the fact that the domestic cat works great injury to agriculture by its destruction of useful birds.

Okanagan county is almost as large as the State of Connecticut. It has a large and increasing population among whom there are no doubt many who are as fond of birds as the cat man is of felines. While the domestic cat does not naturally take to open places, it sometimes becomes wild through abandonment; or, if continuing a house cat, it scours the covers immediately about the house so thoroughly that it is condemned by most sportsmen and bird lovers. This class of the Okanagan county public is likely to have decided opinions about the project for importing cats.

The destruction caused by gophers and ground squirrels is very great, but it may best be put an end to by carrying out the instructions of the Biological Survey for poisoning ground squirrels published in another column.

WALTER WELCH, of Capitola, Cal., has come into his own again. Mr. Welch, an honest man by inheritance and choice, is a game protector by preference. Because he refused to conform to certain alleged customs of his superiors he was removed, several years ago, from his place as State Deputy Game Commissioner. Later on he was appointed county fish and game warden by the commissioners of Santa Cruz county, and fire warden by the State Forester. But a couple of years ago the commissioners discharged him without a hearing, whereupon nearly all the Santa Cruzans protested loudly. In the great landslide of last November the county commissioners found that they had lost their billets over night, and the new commissioners have pleased the county by reinstating Mr. Welch. Santa Cruz county is almost unique in that the sportsman finds in its hills and vales both great and small game, while the angler may choose between salmon fishing in the bay and trout fishing in streams nearby, while the groves are filled with song birds. All these the people wish to protect, and they have chosen the right man to do it.

THE SPORTSMAN TOURIST

Winter Camp-Fires

I.—A January Journey in the Gaspe Peninsula in Quebec

By W. J. BIGNELL

THE most interesting, the most bracing, the most picturesque time of the year to be in the Canadian woods is when fewest sportsmen know them.

This is mid-winter, say in January, when caribou are still in season in the Province of Quebec, to give a *raison d'être,* if one must have something to kill. Most caribou still retain their antlers at this time, affording an excellent chance for trophies. The rivers and streams have become natural highways of white, with only here and there a gleam of open water or a blue sheen of ice.

If you have never had the pleasure of starting off for a week or so at this enchanting time—some frosty morning when the sun is just penetrating the beautiful haze of glistening ice particles in the still atmosphere and turning everything into a scene of enchantment, when the smoke from the chimneys is drifting up in a straight white column, as only wood smoke in winter can do, when branches are cracking from the frost with the report of pistol shots—make up your mind to try the experiment of a forest outing.

Go to familiar haunts where you have canoed and fished and idled on your last summer's outing, and see the transformation that has taken place. Spots you already knew will in their summer garb seem very different on a mid-winter trip.

Perhaps your base is some familiar little Canadian village where lives the particular Jean Baptiste or Jean Paul who guided your destinies in canoe and camp last summer. If you know your man well—know him for a truthful and experienced guide and factotum—well and good, especially if he is a *chasseur de pelleteries;* but if you are not sure of him, nor of yourself in the woods in winter, then look out for unfortunate results.

Many excellent summer guides are not used to this class of work and would cause you needless discomfort, especially if you are not accustomed to snowshoes. Your guide must see that you have on four or five pairs of heavy woolen socks, that your snowshoe straps are adjusted with skill and care, and that you do not overdo it the first day or so, for blistered feet or *mal de raquette* come as a thief in the night, suddenly and without warning. Your guide cannot take any liberties with the short Canadian winter days when the sun scarcely gets above the tall treetops, or perhaps does not show all day through the melancholy, pallid leaden half-light of the forest, and he must not be the sort to

THE SHICKSHOCKS.

get flustered or excited if it looks like sleeping out of doors—an experience which is not as bad as it sounds if you know how to go about it in case of an emergency. In fine, he must not be the kind to forget the matches, to get them wet, or to do any of the little things which turn what in summer is merely an annoyance into a genuine calamity in winter.

One other word of warning. Do not try the woods in winter unless you are fit, for to escape discomfort one must be able to keep going all the time and to keep the blood in circulation. Heavy clothing, except for the feet, is not the secret of warmth, and that pure animal enjoyment which makes you lengthen your stride and which induces the healthy glow that comes from hard exercise. It is fitness and the ability to keep going; so harden yourself physically before you start.

The only really hard work connected with a winter expedition is breaking trail or hauling a sleigh. This work can be left to the men, but if you go to the woods often for sport; or if, as in my own case, business takes you there and sport is secondary and incidental, you will presently prefer breaking trail yourself with an occasional turn behind for a mile or so when the snow is heavy.

If you go to the woods frequently, learn to be your own guide, and after a while you will find that the acme of enjoyment comes when, with the aid of the compass and with a developed sense of direction and distance, combined with the habit of close observation and the ability to distinguish and differentiate things and places which look alike, you can dispense with guides, blazes and trails and can find your own way comfortably, even in unknown and unsurveyed territory.

The mental stimulus, the developed self-reliance and the great pleasure of novelty in unknown forests; the fact that instead of a guide's back being the principal object of your concentration, you are taking in on your own initiative and at the rate of progress that best suits you every charming detail, every little movement or speck of color which denotes wild animal life, all this will make an immense difference in your physical capacity. The interest and occupation of your mental faculties will keep you from noticing the fatigue which otherwise would certainly make itself felt.

As I have said, the rivers are the highways now, and nothing but canoeing in rapid water is more stimulating or gives one more of the feeling of exploration and discovery and conquest than does swinging along, pole in hand, tapping here and there and telling from the sound of the ice what it will stand. Sometimes you cross buckling ice where the pole will punch a hole almost by its own weight if let fall heavily enough, sometimes you take extreme precautions where there are several feet of snow and no apparent danger, but where even as you lift your feet perhaps, a hole the size of the snowshoe track will suddenly appear to the man behind you, showing where you have been supported a moment and no more. Sometimes you swing along with the ease and assurance of long experience on the very edge of the boiling water of an open rapid, where the ice is all in curly little wind-swept waves, and looks as if it was going to break off and drop the adventurer into the rapid, but which in reality would probably bear a horse. Rarely if ever does the practiced woodsman make a mistake, paying for it with a

good ducking or worse, however, if he is misled.

Once one goes through with snowshoes it is almost impossible to get out unassisted. If the damage is no more than a sousing of the feet, and the water has not had time to soak in, packing quickly several times in dry snow will draw the dampness all out, but if one gets thoroughly wet, the only thing to do is to stop and build a roaring fire with all dispatch, change all one's garments if possible, or at least take off moccasins, socks and outer clothing and dry out thoroughly, for wet feet do not take many minutes to freeze. But duckings fortunately are rare, and personally I have never seen a fatal accident, though such have happened where people have gone into a rapid with snowshoes on and have been drawn under by the current.

To those who know how to read it, the snow along the banks and on the river is an open book—a perfect record of the life and movements of all the wild inhabitants of whose presence one sees scarcely any sign in the summer. Except for the hibernating bear and for the moose now in their yards on the mountain, they are all here, these wild creatures, from the caribou to the tiny wood mouse.

Perhaps in traveling over the ice you come upon a round hole about a foot in diameter. Near this opening you suddenly discover a half-eaten salmon which must have weighed all of twenty pounds. The otter has evidently been at work here, and if you keep a careful watch far ahead as you go further up the river, you may possibly see him near one of his other holes. Perhaps there will be two otters rolling or sliding in the snow on the banks, but you will not be likely to get a shot at one, unless at a distance of several hundred yards, for the otter has the sharpest nose of any of the whole woods tribe. The Indian's method of burying himself up to the middle in the snow near one of the holes and of waiting, blanket-covered and gun in hand for one or perhaps two days till the otter pops up, would probably not appeal to you.

A little further on you stop for a moment to look at the brilliant clusters of red berries of the cormier or service tree, hardier than any of its fellows, for the berries of all the other service trees have fallen in December. A pleasant contrast in a world almost white.

Round tracks about three inches across—one almost in front of the other—are the lynx's, but you may go to the woods many winters without seeing him, unless you set a trap and bait it with a rabbit skin or a partridge wing.

Here two caribou have crossed the river, but the tracks are not fresh and you do not follow, and so the day slips away and it is time to stop and tent, which operation in winter will need a good hour or more of daylight.

However tired the tyro may be, let him do some of the light work in connection with tenting, say gathering the balsam boughs for the beds, tramping down the snow for the tent site; anything, in fact, so long as he keeps moving till everything is ready and the tin stove is roaring in the tent. If he sits down or stands around waiting, he will lose the healthy glow and the sense of warmth and repose that would have been his had he kept going till the last minute.

It seems a long time before the smoking supper is ready, but what an appetite greets it when it finally does arrive, and how complete the after joys—the sense of comfortable repletion, the pipe, the old yet ever new stories of hardships endured, of encounters with or glimpses of wonderful beasts, of deeds of extraordinary prowess, till at last the traveler sinks back on the balsam boughs and sleeps as only one who has passed such a winter's day in the open can sleep.

About five or six years ago I encountered the only actual hardships I have ever known in the bush in winter. On two hunting trips during two successive winters, disaster followed us, and in each case the same place was our objective. On the first trip my guide was the sufferer. This same man accompanied me on the second trip, when we were both victims of various mishaps. As if by way of compensation, however, these trips were the most prolific of curious incidents, the most instructive, and the most satisfactory from the standpoint of reminiscence that I have ever taken.

In the interior of the little known Gaspé Peninsula is a range of mountains—Shickshocks by name—with an elevation of about 3,500 feet. The rugged, forbidding, rocky, treeless desolation of their upper reaches and the precipitous, twisted, distorted character of their sides speak eloquently of the fierce upheaval that brought them into being. On clear days in summer the Shickshocks can be seen by travelers on steamers of the St. Lawrence transatlantic route, provided of course that the steamers are far enough out from shore. Some of these mountains have a large area of fairly level barren summit, without any vegetation save arctic moss, shrubs and flowers, and at times are swept by the wind with such velocity that even in mid-winter there is not sufficient snow to necessitate the use of snowshoes. On fine days caribou in large numbers used to climb to these barrens to paw away the snow and feed on the moss underneath.

At the time of my winters of hardship I was lumbering in the Gaspé Peninsula. As Pascal, the man who accompanied me in all my bush work, gave enthusiastic accounts of the sport to be obtained and the number of caribou to be seen in fine weather on the barrens of these interesting mountains, I determined to visit them.

A TRAPPER'S CAMP IN THE WILDERNESS.

THE RIVERS AND STREAMS BECOME NATURAL HIGHWAYS.

Pascal was a powerful six-footer with a tremendous capacity for roughing it and for heavy work. He had hunted for years with Indians on the North Shore and was a mine of information. He was very fast on snowshoes, a regular bull moose of a man, but intelligent and quite well educated.

One of his curious characteristics came to light when he informed me with a savage relish that the sight of running blood gave him most pleasant sensations. As I enjoy doing my share of work on a hunting trip, I took no other man than Pascal with me.

Three days on the river brought us to the foot of the mountain which Pascal had in view. He went directly to a deserted Indian cabin, which we managed to make habitable, thus avoiding the trouble of pitching the tent.

During the evening I got Pascal to tell what he knew of the former inhabitants of our camp. Some years before my advent several families of Indians had come from across the gulf and made Gaspé their hunting ground for a considerable time. The hut in which we were had

belonged to a family of ten and was considered a very large structure of its kind, being at least nine feet by twelve, with sides not less than four feet high. In the middle of the hut one could stand erect.

The family consisted of a man and his squaw, four children, the man's old mother, a younger squaw and a widowed relative with two small children. The youngest child was a mere baby when they first arrived, and had made the journey packed in decayed wood and punk, which is the Indian way of treating an infant during what may be termed the long clothes period. When Pascal first saw the old mother, she was squatted in a corner of the hut, seemingly in her dotage, mumbling and nodding and showing no sign of either intelligence or energy.

Pascal had a line of traps that winter, and the second time he met the old woman was in the woods near his traps several miles from her camp. His astonishment when he saw the aged creature tottering along with about a hundred pounds of caribou on a sleigh may easily be imagined. He asked her, in her own dialect, if she wanted him to haul the load out for her, but she only shook her head, mumbled something and kept right on. Probably she was quite happy in the task. The family of ten got away with some forty caribou during the fall, winter and spring, obtained for the most part on the barrens for which Pascal and I set out the day after our arrival.

I questioned Pascal about the other families who had come over. The only thing of interest that I elicited I jotted down at the time. It was concerning a certain old fellow known as Baptiste Sauvage, who had hunted many years in this territory. He was a Montagnais, and had along with him one of his sons by a first marriage. He had married a second wife shortly after the death of the first, and once in a talkative mood he told about this later venture. Pascal gave me the story in French, keeping to the Indian's method of using that language, and I will try to give an English version in the same spirit.

Old Baptiste Sauvage said: "I marry two time; that one time too much. Soon after get married two time, leave for hunt and stay three month. When I get back squaw say: 'Tiens, Baptiste, you not stay long. Not have good hunt?'

"I say: 'Yes, have good hunt; think three month long 'nough.' You s'pose, Pascal, I not like ver' much she say I not stay long 'nough.

"After while leave for hunt some more and stay six month. When I get back squaw say: 'Tiens, Baptiste, déjà toi? You not have ver' good hunt? You not stay long time.'

"I say: 'Bon, me go right quick on hunt what last long time.'"

Pascal said Baptiste reflected several minutes and then looking up made a sort of grunting which might possibly have passed for a laugh, and which no doubt was intended for one, though his facial expression did not change in the least.

"You s'pose, Pascal, squaw think I stay long time nex' trip? Dat's twenty-two year, and me still on same trip."

Pascal asked Baptiste if he knew what had become of the squaw. Baptiste answered: "I kill her. Make slack on cedar tree, make picture my squaw and shoot—she dead."

The practice of attempting to bring about the death of a real or a suspected enemy by shooting at a blazed tree on which the avenger has done his best to portray the person under disfavor is a custom among certain Montagnais Indians. During my expeditions to the north shore of the St. Lawrence I frequently heard of this superstition, but I have never been fortunate enough to find a tree marked in this condemning manner. Pascal told me that Baptiste really believed in the efficacy of his act, and was certain that some dreadful calamity, resulting in the death of his wife, had been brought about through his treatment of the tree.

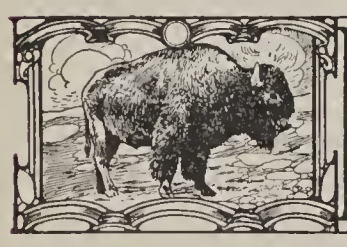
In spite of the fact that these Indians are generally devout Roman Catholics, many among them cling to their belief in the presence and power of hoodooing spirits and "medicine." The very camp in which we slept that night had a rough wooden cross nailed to the wall.

Old Baptiste certainly believed that "there is more in heaven and earth than is dreamed of in our philosophy." Once when he and Pascal had halted for an overnight stay in an empty lumber camp along a portage road, they heard shortly after dusk what they took for a call far down the road. Old Baptiste sat up and said: "Portageur, she's pass early. I see track, so s'pose that some *sorcier* come do us harm. We take gun, go stand in door, and if we see man, we shoot quick."

Pascal suggested that if the passer were a man, he might not be a *sorcier* or a wizard, and that when he came in sight they could ask him his name and make certain of the case, but Baptiste said: "S'pose she's *sorcier,* she got too close an' do us harm before we can speak. Better shoot quick so soon we see man."

Suiting the action to the word, old Baptiste seized his rifle and Pascal followed suit; the latter, however, with the intention of cracking old Baptiste over the head before he could do any harm should the supposed bad man come in sight. Fortunately no one appeared. Pascal asserted that Baptiste was not often taken with these alarming fancies. So much the better for the unsuspecting human being who might happen to cross his forest path.

Baptiste hunted around the region in question till he was nearly eighty years of age, when his strength gave out. One bitter winter morning, after he had been absent an alarming length of time, his son found the solitary old man huddled over a very small fire which he had built on the portage road. He was unable to go any further, so the son placed him on a sleigh and hauled him to the nearest village, where the old man died in a few days.



NATURAL HISTORY

Woodcock Reported in British Columbia.

Cranbrook, B. C., Nov. 12.—*Editor Forest and Stream:* Cranbrook, B. C., is thirty-five miles north from the International boundary line, in a valley 3,014 feet above sea level and more than 1,200 feet lower than Crow's Nest Pass, on the Great Divide, east of Cranbrook one hundred miles, as the railway winds about. Last night was clear and frosty, temperature 22 degrees at 8 A. M., 45 degrees at noon to-day with blue sky and bright sunshine.

This is preliminary to an account of the best and most interesting observation of a woodcock I have had since I first saw this bird nearly fifty years ago. I was walking along a road which passes through a spring fed swamp and saw a woodcock feeding. The time was just after 2 o'clock. He was wading about in water which in places was deep enough so the feathers between his legs were under the surface, and the motion of his body when feeding somewhat resembled that of a tip-up. He was diligently boring for worms, or food of some kind, in the black mucky bottom, and found one so large he had hard work to swallow it. Then he rested with bill on breast several minutes, after which he lazily stretched out backward, first one leg then the other, and began dipping his bill in the water to assist in making a quick toilet, putting up a wing to get at the under feathers, then between the wings and back to the end of his short tail, not forgetting to daintily arrange the feathers covering his breast. All he did could be easily seen, as he was within forty feet of me all the hour I watched him. He was beautifully marked in rich dark colors, and when he stood in the sunshine and rested, all his beauty could be clearly seen.

A flock of tame ducks was feeding here, and when they came too near, the woodcock slowly fed out of the way under the brush and along the shore line just out of the water. When the ducks engaged in a play spell, half flying and swimming about like boys playing tag, quacking, flapping and having a merry time, the woodcock stopped boring and gravely looked on from the bank. When the play was over and the ducks were resting on the water where the sunshine lay, then the woodcock began feeding again and was so doing when I walked away.

Teams passed while I was watching him, men came talking and spoke to me, but I could not

see that he gave heed, probably having become familiar with teams and the conversation of men. It looks as if he has taken up winter quarters, and as the snow fall is light, winter not setting in until the holidays and the frost going out of the ground about the middle of February, he may escape migrating. All about this place the mountains have put on their white coverings, which will remain until nearly, if not quite the first of June.

This woodcock was seen just outside the limits of Cranbrook, and my son, H. Yorke Parker, who is thirty-four years of age, and has hunted woodcock, ruffed grouse, etc., with me since large enough to do so, tells me that in September, 1907, he saw a woodcock near the place I saw this one Nov. 12, 1910. He was within twenty feet of the bird, looked it over carefully, as it was in plain sight, and then flushed it; and the usual whistling of the bird as it rose was distinctly heard. He has also heard others say they have flushed woodcock in the same locality, and that they nest and rear young in a nearby favorable place for breeding.

The only difference I noted, between the woodcock I saw here and our Eastern birds was that he was of a decidedly darker color and markings. We will try to shoot him, if he can be found, and send him to you by registered mail, and not being successful, my son will try to send you one next year.

CLARENCE L. PARKER.

[The westernmost point of the woodcock's range, as known to ornithologists, is in Eastern Colorado, where the bird has been taken as a straggler. In the North it is found as far west as Saskatchewan, but so far as known it has never crossed the mountains nor even been found save casually on the flanks of the Northern Rocky Mountains.

This lends an extraordinary interest to Mr. Parker's letter, telling of observing a woodcock for an hour in British Columbia, and giving accounts of other observations thought to have been made there at other times.

Mr. Parker is a sportsman and a nature lover who, he tells us, has had nearly fifty years in the open, and who should know a woodcock—one of the most unmistakable of birds—as well as anyone can. Ornithologists who recognize possible danger of errors in observation will be inclined to suspend their opinion as to this record until a specimen of the woodcock shall be taken. —EDITOR.]

The Pileated Woodpecker.

WESTCHESTER, Pa., Jan. 14.—*Editor Forest and Stream:* One of the characteristic sounds that startles a stranger in the hardwood forests of Florida is the cry of the pileated woodpecker, or log cock, as well as the resounding blows made by his powerful bill, as he chisels his way toward the center of some dead tree, in his search for grubs and beetles.

In his way he is a skillful woodsman, picking out with unerring instinct the trees than are infested, and destroying large numbers of these enemies of the forest.

When the pileated woodpeckers, like many other birds, have ceased to be abundant in the grand old woods, people will wonder why the insect enemies have so greatly increased to the detriment of the trees.

Recently while driving through the Annuttalaga hummock in Hernado county, I surprised one of these fine birds at work on a dead magnolia. He had torn one side of the tree open, for a distance of twenty feet from the ground, clear into the heart, and his chips, many of them a foot or more in length, lay thickly around, giving one a good impression of the strength and activity of this bird.

His cry is a loud laughing note not easily forgotten and carries a long distance through these woodland solitudes.

His near relative the ivory-billed woodpecker, doubtless once abounded in these same forests,

WORK OF THE PILEATED WOODPECKER ON A DEAD MAGNOLIA TREE.

but his great size and beauty of plumage made him much sought after, and it looks now as though total extinction was to be his lot ere many years. In only a few secluded localities are the ivory-bills found in ever-diminishing numbers, and a nest and eggs of a pair of these birds is one of the rarest finds a naturalist can make.

THOMAS H. JACKSON.

Bird Poaching on Laysan Island.

WORD was recently received of the arrival of another Japanese vessel at Laysan Island which, in ignorance of the arrest of the Japanese left on the island and the seizure of the plumage they had secured, was sent to take a cargo of plumage and leave another set of men on the island. Instructions were at once cabled to the revenue cutter Thetis, which did the patrol work last January, and which was lying at Honolulu, ordering immediate departure for Laysan to protect the birds. It is too early yet to receive information of the result of this second visit of the cutter.

To Destroy Ground Squirrels.

THE vast amount of damage caused by small rodents has often been pointed out and is generally known. The domestic rat causes millions on millions of destruction of property each year, field mice sometimes ruin crops, and always reduce them, while prairie dogs and other ground squirrels cause enormous losses to agriculture. One of the most destructive of these rodent groups is that which includes the various ground squirrels of California, comparatively large animals which live in burrows in the ground, but are also tree climbers. In primitive times they fed on acorns, wild seeds and berries and vegetation, but now they eat cultivated grain, nuts, fruit, vegetables and alfalfa and clover.

These animals occur generally over the agricultural part of California and do an enormous deal of damage. They are particularly fond of green almonds and of the pits of green peaches and apricots, and in some places are said to take half the apple crop. They gnaw off the shoots of the young vines, gnaw the bark of orange and almond trees, and carry off large quantities of the drying prune. By their burrows they cause breaks in dikes and levees, and often deprive the ranchman of water at the time he most needs it for irrigation. The chief damage that they cause is to the grain fields, where they devour the newly sown barley, wheat and oats, dig up and carry off the sprouting kernels, cut down the grain when it is in the milk, and after it has ripened and is cut, eat all that they can, and carry great quantities away in their cheek pouches to their underground burrows.

As if all this were not enough, the Asiatic plague is epidemic among squirrels immediately east and south of San Francisco Bay, no doubt contracted by contact with the rats at seaport towns about the bay. A number of fatal human cases have been reported.

A circular on the California ground squirrel by Dr. C. Hart Merriam, Consulting Biologist, has just been issued by the Bureau of Biological Survey, of which H. W. Henshaw is Chief. A considerable portion of this circular is devoted to the consideration of the means by which these animals may be destroyed. One of these means is the encouragement of the squirrel's natural enemies, such as coyotes, badgers, foxes, bob-cats and the golden eagle; another is trapping; but the most effective means is poisoning. This poisoning is best done with strychnine applied to barley, which is more attractive to squirrels and less likely to be eaten by birds than any other bait, and the best way of administering it is by coating the grain with a poison solution. This method, except during the rainy season, kills the animals more quickly than grain that has been soaked, and being killed quickly, the creatures die above ground and are likely to be seen.

The success of the poison-coated grain is largely due to the squirrel's habit of gathering seeds and carrying them home in its cheek pouches. These cheek pouches are muscular sacks lying one on each side of the jaw and throat, and each large enough to hold about two hundred kernels of barley. In these pouches they collect food to be carried to

their burrows and there stored for winter use. When grain coated with a strychnine solution properly prepared is caried in the pouches, enough of the poison is dissolved and absorbed to kill the animal almost at once. S. E. Piper, one of the Biologieal Survey force, made the discovery that strychnine is far more quickly absorbed by the cheek pouches than by the stomach, and that one-fifth the quantity necessary to kill by the stomaeh will kill when taken into the pouches.

How effective this poisoning may be is shown by the fact that a twenty-five acre tract poisoned with forty pounds of starch stryehnine-coated barley yielded a few hours later 240 squirrels. Of the animals killed by poison only a part are seen dead, for a great number die in their burrows.

The formula perfected and recommended by the Biological Survey is this:

Barley, clean grain, free from other seeds	20 quarts
Strychnia sulphate (ground or powdered)	1 ounce
Saccharine	1 teaspoonful
Gloss starch (ordinary laundry starch)	½ teacupful

The starch should be dissolved in a little cold water, and one and one-half pints of boiling water added. This makes a rather thick solution, into which, while hot, the strychnine should be stirred and mixed until free from lumps. The saccharine is now added, and thoroughly stirred in, and then the poisoned starch is poured over the barley and stirred rapidly until the poison is evenly distributed. The grain is now allowed to dry, after which it will keep indefinitely.

The poisoned grain is to be scattered about, preferably on clean hard places, and on the trails made by the squirrels between the holes and in other places where they run. The best season for poisoning is the dry season; that is, from April to October. If poison is put out in the rainy season, it is much less likely to be taken by the squirrels, which are at this season not out in full numbers, while the abundance of fresh green food makes them care less to take the grain and the rain washes off the poison or carries the bait away.

The cost of this poisoning is very small, not more than three cents an acre, when undertaken on any considerable scale.

While this poisoning will kill many squirrels, it will not kill them all, and colonies should be watched and efforts made to destroy those which are left by poisoning them with bisulphide of carbon, in a way often described by the Survey.

One discouraging thing to be noted about the efforts to get rid of these pests is that while one farm or one small locality may be so treated that squirrels may be nearly exterminated, the occupants of adjoining territory may have taken no measures against the squirrels on their land, from which the land of the neighbors may soon be overrun again.

The American Breeders' Association.

THE seventh annual meeting of the American Breeders' Association will be held at Columbus, Ohio, Feb. 1, 2 and 3. The members of the association will be the guests of the National Corn Exposition.

The program which has just been issued, gives a list of papers to be read on breeding animals, birds and plants and on many kindred subjects.

The report of the committee on breeding wild animals will be presented by D. E. Lantz, of the Biological Survey, of Washington, D. C., and he will also read a paper on the domestication and acclimatization of wild animals in the United States. Dr. T. S. Palmer, of Washington, will present the report of the committee on breeding wild birds, and Prof. B. W. Evermann the report of the committee on breeding fish.

The meeting promises to be one of unusual interest. Further information with regard to it may be had by application to Hon. W. M. Hays, secretary, Washington, D. C.

Hand-Rearing Game Birds.

To a recent issue of the New Haven Register, Herbert K. Job, State Ornithologist of Connecticut, contributes an interesting article on the propagation of game birds. It is worth while that these well known facts should be repeated again and again. Mr. Job says:

The motto of the English and Continental gamekeepers is: "For every bird you shoot, put back two." The result is that they have game in abundance all the time. Until we do something similar, besides, of course, taking proper care of what wild stock we have left, every passing year will see our game birds grow scarcer.

Our American method has been to allow practically universal hunting, till most of our game birds have been killed off, and then, at the demand of the hunters who pay licenses for more game to shoot, we buy up birds and release them to be shot. Since it is no longer possible to buy native game birds for restocking purposes, we have had imported foreign species—notably Hungarian partridges and pheasants—in hope that some of those would survive and restock our depleted covers. Various States besides ours have tried these experiments, which were well worth testing and gave hope and promise for good results.

Expert authorities, such as the United States Biological Survey, as voiced by Dr. T. S. Palmer, in charge of game protection for the Government, now agree and declare that nearly all those experiments have proved utter failures. Harry Oldys, of the Biological Survey, shows that the Hungarian partridge migrates, and that the costly birds bought by the commissions of Northern States are enjoyed by the Southern gunners. In general foreign birds prove nearly helpless under the new conditions, and quickly perish. Evidently we are on the wrong track. Sportsmen are beginning to realize that in the artificial propagation of our native game birds must lie our main hope.

In Europe they know how successfully to breed game birds, including American species, and it could be done exactly as well here as there. In Belgium, for example, they breed our beautiful native American woodduck by the thousands, and strange to say when we want woodducks we have to send over there for them. They raise game birds as successfully as we do chickens. What is the matter with us?

The idea is taking root in this country. Successful game farms, mostly for private profit, are springing up, notably in the Middle West, and a great new and profitable industry is arising. Wild ducks are raised by thousands for sale for all possible purposes. This is true of pheasant raising, and some are having very fair initial success with quail, as well as other game. The Massachusetts Fish and Game Commission have been very enterprising. They started a small experimental hatchery and last season raised 400 young quail, enough to prove that they have practically solved the problem. Now they are preparing to go into it on a larger scale, and also to experiment with other game birds. The Springfield Fish and Game Association, said to be the largest sportsmen's organization in New England, are taking steps to have a hatchery or two of their own.

Last September I was visiting Prof. C. F. Hodge, of Clark University, Worcester, Mass., discoverer of the methods of the artificial rearing of quail and ruffed grouse. In his garden he showed me a little box coop attached to a close mesh wire run some eight feet long. In this run were a beautiful pair of our familiar bobwhites, accompanied by a brood of the cutest little chicks of their own just a week old.

"This means," said Dr. Hodge, as I admired the little family, "that any man with only a city back yard can raise his covey of quail."

This is the key to the situation. Another article later will propose a definite practical plan for a State-wide propagation of game birds in Connecticut. Meanwhile the writer will be glad to correspond with sportsmen's associations upon the subject.

Deer in Ammunition Park.

WITHIN an inclosure of 370 acres of wild land at Bridgeport, Conn., is located the powder magazines and shooting range of the U. M. C. Company.

One morning, about a year ago, a doe was discovered within this park. About a year later she was joined by a buck, and then a short time after the family was increased by the arrival of a fawn.

Quite recently the group was found to have increased to six, another fawn, doe and buck having joined them. So accustomed have they become to their surroundings that frequently during the testing on the 1,000-yard range it is actually necessary to drive them away from the line of fire.

New Publications.

HOUSEBOATING ON A COLONIAL WATERWAY, by Frank and Cortelle Hutchins. Decorated cloth, 8vo., 300 pages, $2.50. Boston, L. C. Page & Co.

The opportunities for observation, and the recording of fresh impressions, are peculiar to houseboaters, but the log of the houseboat Gadabout is a classic, and therefore worth reading. For Gadabout, being equipped with two motors, went where her owners listed, saving, of course, when the elements were not kind; but as there was no occasion for haste, this mattered not at all. As the authors say, the cares and responsibilities of life fall away when people go houseboating. The record opens at Norfolk and has to do with the James and the people who lived and now live on its shores. There is much that is interesting concerning the history of the old colony and its people, and the illustrations, from photographs by the authors, are both excellent and numerous.

GAME BAG AND GUN

Airship Hunting to be Barred.

SAN FRANCISCO, Cal., Jan. 10.—*Editor Forest and Stream:* The State Legislature is now in session and within a short time several bills of decided interest to sportsmen will be introduced. Among these will be bills reducing the bag limit on ducks from twenty-five to fifteen and making it unlawful to offer ducks or geese for sale. The latter measure has been presented regularly for several years, but has always failed of passage. That it would be a great injustice to prohibit the sale of geese is the belief of a great number of farmers engaged in the business of grain growing, for these waterfowl are still in such great numbers that in the winter time immense damage is done to growing crops, and the visits of the market hunters to the fields are welcomed. Others are protesting against closing the markets to ducks, and it is anticipated that these two measures will fail of passage as in the past.

From present indications California will be the first State in the Union to prohibit the hunting of wild game from airships or air craft. The recent exploit of Hubert Latham in Southern California, when he shot a bluebill duck from an aeroplane and incidentally frightened thousands of the feathered tribe to such an extent that they have not yet returned to the preserves over which he sailed, has come to the attention of the fish and game commissioners, and a law is now being framed that will prohibit in the future this form of hunting. The fact that this airman broke the law in making his hunt will not be pressed, but as Latham is an alien, he should have purchased a hunting license before going on his trip, and this would have cost him twenty-five dollars.

As soon as the measure designed to put a stop to hunting of this character is drafted it will be presented to the game commissioners for approval and will then be submitted to the Assembly and Senate. One member of the commission expressed himself as follows in regard to the proposition:

"We feel that such a law should be enacted as soon as possible because that now one man has shot ducks from an aeroplane, we fear that others will hurry to follow suit. Aviators have done wonders during the past year, and it would seem that they stop at nothing.

"Within a year it might become the fashion to hunt ducks and geese in aeroplanes all over the State. Every aviator would wish to do it. California is a great game State, but it is also a State well suited for aeroplane flights, and the sport will soon become general here. Now an aviator could sail up the San Joaquin and Sacramento valleys on a hunting trip and frighten game birds for miles. The birds would soon begin to leave the State, it would do no good to maintain feeding grounds, and the whole sport would be demoralized for hunters who wanted to go after the birds in the usual way. Not only birds, but all kinds of game, rabbits, bears and deer will be protected from aviators under the new law. It would be too easy to fly over the country, taking in a survey of several miles square and pick out game beneath. The law is to be a very inclusive one and will effectually protect all sorts and kinds of game."

Legislators have been considering the proposition that Latham and others might be excluded from shooting game under the provisions of the present law which makes it unlawful to shoot at any kind of wild duck from any boat propelled by power. It is argued by some that an aeroplane is an airship and therefore a member of the "boat" family, but for fear that this opinion would not hold good, the new law will be passed.

The lack of rains during the past month in California is making it difficult to secure satisfactory bags of ducks outside the preserves, and only a heavy baiting of the ponds will attract the birds there. There is but little food to be found in the old time feeding grounds along the Sacramento and San Joaquin rivers and their tributaries, and the result is that the birds are migrating to other localities. There has been practically no rain in California this season, and birds are finding it difficult to secure sufficient food. On San Pablo Bay large numbers of birds are to be found, these feeding on the preserves at night and resting on the bay in the daytime out of reach of danger. Limit bags in any of the preserves are now but rarely secured, and the birds that have been here for any length of time are in poor condition. Numbers of spoonbills are coming in from the North and canvasbacks are also in evidence now in numbers.

Owing to the dry season geese are to be found in but few localities, but in these places they are in large numbers. The best shooting grounds are in the vicinity of Rio Vista, although some are being secured regularly in the Los Banos district.

Quail have been found in larger numbers this season, perhaps, than for a long time past, and in some sections limit bags can still be easily secured. In the vicinity of Folson the birds are to be found in thousands, and a number of San Francisco sportsmen made the trip there during the holiday season.

A number of local sportsmen banded together this season and donated the game secured by them the day before Christmas to charity organizations here, and thanks to their generosity many unfortunates were enabled to enjoy a fine game dinner.

H. G. Boyes, a market hunter operating in the vicinity of Princeton, was arrested recently by Deputy S. J. Carpenter for exceeding the limit bag of ducks.

A. P. B.

A BUTLER-HARMONY trolley line motorman reports having killed seven rabbits while his car made a single trip. He says the rabbits sit on the roadbed at night and are apparently blinded by the headlight, when the car fender strikes and kills them. He says he keeps an eye open for the rabbits and when one is killed stops the car and picks it up. He has had all the rabbits he could eat since the season opened. —Philadelphia Record.

Active at Ninety-eight.

OMAHA, Neb., Jan. 6.—*Editor Forest and Stream:* The oldest and most interesting sportsman in Nebraska is the father of W. H. Barber, the well known physician and sportsman of Fullerton, Neb., with whom the old gentleman resides.

While camped there on the Loup one day during the latter part of the month just closed, and when the wind was blowing razors down from the north and the mercury below zero, Mr. Barber, who is in his ninety-eighth year, had the hardihood to induce his son, the doctor, who is no spring chicken himself, to hitch up his bays and drive him out to where we were camped on the frozen river nine miles away.

The report that our cook had taken into Fullerton the evening before of the glorious sport we were having with the big black geese and old red-legged winter mallards was too much for the venerable nimrod. His heart was aflame with the fires of youth, his eyes sparkling like diamonds, and for the time being his limbs as sure, strong and supple as in the days of the long ago when he trapped beaver and otter and shot buffalo on this same old legendary stream, and that too in and about the scraggy willow woods in which our canvas palace stood.

Mr. Barber came to Nebraska while the war of the rebellion was at its height and settled near the Pawnee reservation where the little city of Genoa is located, and for years followed trapping and hunting for an existence. In the late spring of 1865 he came to Omaha, over the old Oregon trail, from his trapping grounds along the Loup, with 4,000 muskrats, 100 beavers and large numbers of otter, mink, skunk, coyote and wolf pelts, and despite the war time depression in the markets, reaped a little fortune from the same.

Grandfather Barber has led an exemplary life, is a devout Christian, barring an occasional slip of the tongue, a man of much natural intelligence, a most interesting story teller and the father of eleven children. Close as he is upon the century mark, he is still inordinately fond of hunting and fishing, and while incapable of going out much himself, can still handle both gun and rod with skill, and his chief enjoyment is to sit and listen to the tales told by his son and kindred spirits of the woods and streams and fields. He is particularly taken with the stories of goose and duck shooting, of which he was intensely fond, even in his old trapping days.

He marvels much over the wonderful fowling pieces of this generation, and says that some of our kills are at longer range than he used to think of trying on deer and bear with his old Kentucky pea rifle. Grandfather Barber says he is going out with us on the river in March, and it is our fervent hope that he will be able to make his word good. He is surely a grand relic of the old day wild life, and a man who deserves a niche in the hunters' Hall of Fame.

W. D. Townsend, a popular local sportsman,

leaves for an extended hunt along the Florida coast and over on the Bahama Islands the latter part of next week. Mr. Townsend will be the guest of an old shooting and fishing chum of Tarpon, Fla.

George A. Hoagland and son Bill left this morning for Rockport, Tex., for their annual mid winter shoot. Mr. Hoagland is probably the wealthiest man in Nebraska, and either shoots or fishes with brief intermissions of rest from January to January.

State Fish Commissioner Will J. O'Brien is out with a strong plea to the Legislature to change the law disposing of the handsome sum of money that is derived from the shooting and fishing licenses which now go to the school fund. Mr. O'Brien very properly urges that this money or the bulk of the amount be devoted to the improvement of our State fish hatcheries, and to the propagation, protection and preservation of our game and fish.

Since the present license law has been operative, Mr. O'Brien says that annual average collections from resident and non-resident licenses have been a little over $9,000 a year, or $90,000 for the ten years, and the fish commissioner or game committee has not been allowed to use a single dollar of this fund. He also says that Nebraska is the only State that handles this sort of revenue in this way. Iowa's Legislature appropriated $1,300 out of the general fund for the support of her game and fish commission and passed a universal license law which produced an income of $108,000 the first year it was in effect, and the commission was empowered to use every penny of this big fund for the propagation and protection of its fish and game. The last Colorado Legislature appropriated $72,000 for the support of its game and fish department, and the wardens collected $53,174.60, all of which went to the game and fish propagation industry. Kansas has a universal license and collects annually about $40,000, all of which the game and fish commission is empowered to use for the same purpose. The last Missouri Legislature appropriated something like $90,000 for its game and fish interests and besides devotes all the license money and that derived from the confiscated game and fish to the support of its game and fish commission.

Mr. O'Brien gives these figures to show that all our surrounding States are spending all moneys derived from this source in the interests of their game and fish. He says the figures are small when compared with what New York and Pennsylvania are doing in this line. Last year the New York State Game, Fish and Forestry Commission expended $481,000, and of this large sum $68,000 went to fish culture. The last Pennsylvania Legislature appropriated $172,000 for the support of her fisheries department, the game commission being a separate body in that State. Pennsylvania now operates eight fish hatcheries and has started on the ninth a fish preserve containing 1,200 acres donated by the State and National Government, and they expect to expend $250,000 on this project and make it the finest natural fish culturing station in the United States.

In view of what these States are doing, Commissioner O'Brien thinks it high time that Nebraska was waking up and doing the right thing by its anglers and shooters who pay such enormous sums into her treasury. SANDY GRISWOLD.

New York Forest, Fish and Game Report

THE annual report of the State Forest, Fish and Game Commissioner recommends that the open season for hunting deer be continued as at present, or if any change is made that the season be lengthened to include the first two weeks in November, with the restriction that no does be killed at any time. The protection of does would conserve both deer and hunters, as a hunter who stops before shooting to make sure that the animal at which he fires is not a doe is not likely to kill a human being.

It is recommended that some amendment should be made to the law which would permit the possession and use of dogs for legitimate purposes in the Adirondack section. A properly safeguarded system of registration of dogs, it is said, could no doubt be made which would permit the use of dogs for bird and fox hunting.

A bureau of inland fisheries is recommended to have charge of the commercial fisheries of the State not now under the jurisdiction of the bureau of marine fisheries. The State's revenue could be materially increased by this bureau with but slight outlay.

The total acres burned over by fire during the year were less than 13,000, which is only about 4 per cent. of the acreage burned over in 1908. The value of oil-burning locomotives in forest sections has been demonstrated. The number of observation stations for observing forest fires has been increased from seven to twenty-one. The production of spruce lumber for the year shows a decided increase, as does also the output of pulp wood.

Nearly one and three-quarter millions of trees were sold to private landowners for reforesting, the demand which could not be supplied being fully half a million greater. The nurseries have been enlarged during the year, and there are now on hand nearly 12,000,000 trees which will be ready for distribution during the coming two years.

THE ADIRONDACK ANIMALS.

ALL the reports from the great Northern forests indicate that the animals therein contained have made a steady increase under the present protective system. This is especially true of the elk (wapiti) and the familiar deer. Although the foliage was heavy until late in the hunting season, and there was little rain or snow to quiet the woods, deer hunters were as successful as ever. Certain sections, particularly the lower Adirondack region, showed poor returns, however, and it was not until the season was well advanced that the best results were secured by the hunters who at that time fairly swarmed in the woods. There were the usual early predictions that there would be a poor season, but later it was admitted by the guides that the deer were not only larger than usual, but that there was no apparent falling off in the number to be found by the skilled sportsman. Reports received by the New York Forest, Fish and Game Commission showed that fifteen deer were killed by railroad trains along the line of the Webb preserve in the Adirondacks during the year, and that one was killed in the Catskills.

From the record which follows it will be seen that the shipments were entirely satisfactory, and that on an estimate of $25 value placed on each deer killed, the return from this species of animal life in the Adirondacks was at least a quarter of a million dollars.

THE ANNUAL KILL.

Statistics collected each year, showing the number of carcasses, saddles and heads shipped out of the Adirondack region over the various railway lines form interesting reading for those who make a study of Adirondack deer. Beginning with the year 1900 and including the season just closed, these figures are as follows:

Year.	Carcasses.	Saddles.	Heads.
1900	1,020	89	95
1901	1,062	103	121
1902	1,354	113	193
1903	1,961	145	188
1904	1,618	124	152
1905	2,196	108	180
1906	2,413	108	102
1907	2,021	72	70
1908	1,986	103	85
1909	2,810	51	164
1910	2,155	53	135

A detailed statement of the shipments of deer from points in the Adirondack region, showing the railroad stations from which the shipments were made, is given in the following tables. By comparing these figures with those given in former reports, it will be easy to see how the shipments vary from year to year from the various stations.

NOTABLE SHIPMENTS.

It is shown by the records that the dressed weight of the heaviest deer reported as shipped out in 1906 was 246 pounds, in 1907 it was 300 pounds, in 1908 it was 250 pounds, in 1909 one was reported weighing 245 and another 277 pounds. During the 1910 season one carcass was shipped from North Creek weighing 213 pounds, one from Riverside weighing 226 pounds and one from Stony Creek weighing 215 pounds. Other heavy shipments during the season are shown by the following table, taken from the records of the American Express Company:

Derrick	Mrs. E. Ott, Buffalo	200
Derrick	D. J. Terpening, Oneonta	211
Santa Clara	C. Weidman, New York	224
Santa Clara	L. Lillis, Syracuse	200

Glenfield	W. J. Moore, Copenhagen	244
Lowville	John Evans, Syracuse	210
Prospect	H. L. Kane, Utica	208

Manor Baumes, of Dolgeville, also reported shooting a buck near Piseco Lake that weighed 223 pounds dressed. Harvy Bull, of Middletown,

got one weighing 221 pounds and H. L. Preston, at Long Lake West, one that weighed 273 pounds.

It is also recorded that three carcasses of deer were shipped from Millbrook, Dutchess county, and this brief record again causes us to express a sincere regret that no exact returns of deer shipments are had from the Catskill region. There is no doubt whatever that the kill in this section annually is considerable.

ALBINO DEER.

But one albino deer was reported shot during the season that could be definitely traced. This was a buck weighing 172 pounds and was killed in the Granshue township by a guide named Harvey Eastman. It was a pure white specimen and was sent to Saranac to be mounted.

MISCELLANEOUS ANIMALS.

As usual there were received a variety of reports as to different species of animals killed by hunters and guides during the open season. Near Natural Bridge on Indian River three otter were shot in January by C. E. McCoy, who was hunting for other game at the time. Several wildcats were killed at various times and in various sections. A fisher was shot in the Adirondacks in February by Alvin Howland, of Manchester, and was one of the first killed in many years in this section.

Two silver gray foxes were killed during the season, both in good condition. One was secured in Wilton, by John W. Burdick, of Saratoga Springs, and the other near New Milford, by Matthew Gannon, who received $40 for its fur, according to the report furnished.

All the reports from the sections in which beaver have been placed by the commission show that these animals are multiplying steadily. This is true of the Catskill section as well as of the Adirondacks. The residents of the sections in which the beaver are thriving take much interest in the animals and protect them in every way possible. It is probable that in a few years there will be a large number of beaver wherever the present stock is found.

Brown's Tract Guides.

UTICA, N. Y., Jan. 13.—*Editor Forest and Stream:* The Brown's Tract Guides' Association held its annual meeting and banquet last night at The Wood, in Inlet, at the head of Fourth Lake, Fulton Chain, the attendance being large. Officers were elected as follows: President, A. G. Delmarsh, Inlet; Vice-President, Fred Burke, Old Forge; Secretary, A. M. Church, Boonville; Executive Committee, George Goodell, Old Forge; David Charbonneau, Old Forge; Earl Covey, Twitchell Lake; D. R. Ainsworth, Big Moose Lake; C. D. Kirche, Inlet; M. J. Oley, White Lake Corners; J. E. Ball, Old Forge.

Resolutions were adopted to the effect that the open seasons for fish and game should not be changed, and recommending that the Legislature enact a law limiting the number of trout that may be caught by one individual in one day to twenty, this law to apply only to the Adirondack region.

The annual report of the secretary referred to the proceedings of the last annual meeting, mentioning among other things that a resolution advancing guides' wages, was adopted. Continuing, the report said: "The resolution to advance wages from $3 to $4 a day occasioned much discussion by members present at the annual meeting, and has been a subject much discussed by active as well as associate members since. To many it was a procceding to which they had given little or no thought, and upon which many refrained from voting for that reason. Some few of our guides adhered to the $4 a day rate and received it, the greater part accepting the $3 a day rate as in previous years. One active member, not wishing to be bound by such action on the part of the association, resigned his membership. Four associate members, arguing that the action by the association was hasty and unfair by reason of their not consulting with the associate members, withdrew from the membership. One other active member resigned and several associate members withdrew from the association for business and other reasons.

"There was the usual rush of hunters during the deer season and game was hunted hard and long. Not so many deer were killed as in 1909, the reason given for this being the shortening of the season and unusual scarcity of deer in some localities. Most reports were that deer were less plenty than usual.

"We received from the State about 35,000 brook trout fingerlings, which were placed in streams about Fulton Chain and Big Moose. A good supply of lake trout were placed by the association in the Fulton Chain and in Big Moose and vicinity. About 20,000 rainbow fingerlings were distributed in the same section, while several millions of whitefish fry, the eggs of which were taken in the Third and Fourth Lakes, were hatched in the Fulton Chain Hatchery and planted in the same waters. We should see to it that more of this sort of work is done. It should not all be left for the association to do. There should be more applications for fish from individuals. There should be one from every cottage and camp on the lakes. If need be the association can care for and plant these fish for you. Put in your applications and request that they may be furnished from the Fulton Chain Hatchery, for there are hatched and raised the finest trout of any turned out by the State.

"The winter of 1909-10 was not really severe. The snow did not come till quite late in the winter. There was some suffering among the deer and some fatalities, but nothing general or serious. A few days were spent in studying the situation, a small amount of feeding being done, but an early thaw saved the necessity of further expense.

"There has been the usual amount of game law discussion among the clubs and associations throughout the State, the usual number of game law amendments suggested, and some of them are good, but most of them are bad. Some of them would lessen the destruction of game, but the greater part is a cry for more meat. John B. Burnham, deputy game commissioner, suggests a return to the buck killing law of 1909 when a greater number of deer were killed than in any year since 1869. Others suggest a return to hounding. Lengthening the season, or making it easier to get the game, will not lessen the kill. Shorten the season and make it harder to get the game if you would protect it. Your secretary has stood for some years for a law that would allow the killing of bucks only at any time with a penalty for its violation so severe as to compel the hunter to know what he is shooting. It will never be safe to hunt in forests inhabited by deer as long as people are allowed to shoot at everything that moves or jumps. A person buys a gun for the purpose of killing something. He would not have it if it would not kill. Then why not have a regulation that will compel him to know before he shoots what it is he is shooting at? It would save much game and prevent the killing of some men.

"We had a balance on hand at the close of 1909 of $178.51. Our receipts in 1910 were $365 and our expenses for the year were $369.74, which leaves a balance on hand at the present time of $173.77. We received in 1910 twenty-eight new members. Cards were issued to one hundred guides or active members and to 366 associate members."

W. E. WOLCOTT.

A Great Run.

PINEHURST, N. C., Jan. 14.—*Editor Forest and Stream:* All Pinehurst is responding to the mellow notes of the horn these beautiful January mornings for the enjoyment of fox hunting under the leadership of Mr. and Mrs. James T. Twitty, of Buffalo, who are here for the season with their fine pack of English and American hounds. The chances are if a certain group in the hotel corridor is not talking golf, it is fox hunting, telling again the story of the week's best run, four hours of glorious music in a chase which for length, excitement and variety is rarely equalled.

Trailing quickly to the strike the pack had reynard on the move soon after luncheon and not until sunset did the music end in the death struggle. In experience of years, master and huntsman declare they have never seen the equal of this fox which has baffled pack after pack in the territory over which he has roamed for years past; hunters coming from various points season after season, camping and running him for a week at a time, always with the result, "almost but not quite."

Cunning beyond man's conception he was, but doubtless over confident from repeated victories and thus the end came. Game to the core, however, fighting with the pack until the mere force of numbers overpowered him.

During the first three hours of the run every moment in full cry, it was from hillside to swamp and swamp to hillside the fox seen again and again employing every ruse known to this craftiest of animals—doubling, circling, log-hopping, fence walking. Relentless, the hounds pursued, finally balking a clever effort to double, cutting down the lead and forcing an open sight run of 300 yards which brought the great race to a remarkable climax, Roebuck breaking away by a magnificent spurt at the close, grappling in the death grip at full speed and fox and hound rolling over and over before the pack was upon them. A moment later Mr. Twitty topped an adjoining fence and the chase was over.

A previous run was an exciting one with the kill after two hours of trailing and an equal race, the fox being caught in an attempt to cross a hill to an adjoining swamp which the leading hound balked, driving him back to the pack.

All the game laws of the United States and Canada, revised to date and now in force, are given in the Game Laws in Brief. See adv.

Massachusetts Fish and Game.

BOSTON, Mass., Jan. 14.—*Editor Forest and Stream:* The executive committee decided that the annual dinner should be held this year, Jan. 11, and that the Governor, the Speaker of the House and the President of the Senate be invited as guests of the association. The banquet was held at the Copley Square Hotel, the home of the association for many years. It was at this house that the convention of game protectors assembled in 1899 in response to an invitation from the State association, the most notable gathering of its kind ever held in the State. The result of this meeting was the organization of the Massachusetts Central Committee for the protection of game and fish, to whose efforts is due the most important legislation on our statute books—the prohibition of the sale of woodcock and ruffed grouse. For the details connected with these important events I refer your readers to the columns of FOREST AND STREAM.

At the annual business meeting, held at 5:30 P. M., President Charles presided. The fund committee, the committee on the Ivers Whitney Adams fund, the treasurer and the secretary submitted their annual reports, all of which were duly accepted. These reports showed that the receipts for the year exceeded the expenditures by more than one hundred dollars, and that the life membership and reserve funds had not been drawn upon beyond the accrued interest.

The following officers were unanimously elected: President, Salem D. Charles; Vice-Presidents, George W. Wiggin, James R. Reed, William S. Hinman, Homer L. Bigelow, Alpheus R. Brown, Francis B. Crowninshield, B. Varnum How, Gardner M. Lane, Frank E. Peabody, Dudley L. Pickman, Maurice H. Richardson, Charles E. Stratton, Nathaniel C. Nash, Joseph T. Herrick, Adelbert D. Thayer, Stephen M. Weld, John S. Ames, Heber Bishop, A. George Bullock, Frank Fallon, Henry Hornblower, A. B. F. Kinney, William A. Morse, Charles H. Nowell, George M. Poland, W. C. Woodward, William Minot; Librarian, Edward W. Branigan; Treasurer, Rollin Jones; Secretary, Henry H. Kimball; Fund Committee, George W. Wiggin, Ivers S. Adams, George M. Poland; Committee on Adams Fund, Ivers S. Adams, Heber Bishop, George W. Wiggin; Membership Committee, Thomas H. Hall, Richard V. Joyce, Jas. H. Bowditch; Executive Committee, Salem D. Charles, ex-officio; George W. Wiggin, Ivers W. Adams, Wm. P. Wharton, Charles M. Bryant, Heber Bishop, M. A. Morris, Alpheus R. Brown, Rollin Jones, George B. Clark, Charles S. Bird, Henry H. Kimball, ex-officio.

After the election of officers it was moved that the association oppose any attempt to repeal the present law providing an open season for deer in the five western counties. The motion by a large vote was referred to a future meeting, the members evidently regarding the question as of too much importance to be acted upon without due deliberation and a full discussion. A feeling is entertained by some of our members that the whole subject of deer legislation needs thorough overhauling. Among those who have studied the situation there is a strong opposition to the present farmers' law allowing the slaughter of deer in the breeding season.

This seems a barbarous method of getting rid of the beautiful creatures, even if they are, as some claim, a nuisance. So far as the five western counties are concerned, local option should prevail as regards an open season.

At 7 o'clock the members and guests, about one hundred in number, gathered about the tables, President Charles acting as master of ceremonies. At the head table were the president of the Senate, Allen T. Treadway; Dr. George W. Field, chairman of the State Commission on Fisheries and Game; Hon. George W. Wiggin and James R. Reed, former presidents of the association; Ivers W. Adams and A. B. F. Kinney, George B. Clark, Dr. Heber Bishop and others. Dr. A. R. Brown led the singing which was quite a feature of the evening. Mr. Treadway, the first speaker, expressed the opinion that government of State affairs as conducted in Massachusetts by commissions was correct in principle, provided appointments are made on the sole ground of efficiency for public service and not as political rewards. "I think," he said, "where commissions are not required to pass on matters in a judicial manner, as good service can be performed by one commissioner as by several." He declared that he would not be in favor of curtailing the commission form in State administration beyond the point where it can be shown that it has lacked in business methods or in efficiency. He spoke very decidedly in opposition to the open season for deer, declaring that it had not been satisfactory in Berkshire county, where the sentiment is almost unanimous for its repeal. He expressed the hope that the sentiment of the association would be the same.

He stated that during the open season of six days there were killed 1,312 deer, and by the farmers 327, and that 101 were wounded, making a total of almost 1,700. "On what ground," he asked, "can we justify the butchery of such a number of those beautiful animals?"

The Senator urged the support of the association in the work of reforestation.

George B. Clark, of Boston, gave a glowing account of his recent hunting trip in the region of the headwaters of the Nepisiguit River, New Brunswick, after which he showed several fine pictures on the screen depicting the scenery and the immense herds of caribou that he saw on the barrens as well as the superb trophies which he obtained on the trip. Mr. Clark's part was a feature of the evening.

Among the bills that have been introduced in the Legislature is one presented by Senator Tolman, providing that deputy fish and game commissioners shall be game wardens, their pay for the first year to be $50 per month, to be increased by the addition of $150 annually until a maximum salary of $1,500 per annum is reached.

The deputies who bring to the service proper qualifications and give the work the best that is in them no doubt earn at least $1,500 yearly, but there is a question now being considered by many intelligent sportsmen, viz.: how can the present warden system be improved?

It has been suggested that each county have a chief, the larger ones two or three, with one or more sub wardens in every town serving at critical seasons for pay. With fifteen to twenty towns to care for as now, the work must of necessity be spread out very thin.

HENRY H. KIMBALL.

In the South.

NEW ORLEANS, La., Jan. 14.—*Editor Forest and Stream:* Harry Whitney, F. M. Carnegie, a nephew of Andrew Carnegie, and A. C. C. Sage are in Ripley, Miss. They will hunt big game in Mississippi for some time and will probably attend the Mardi Gras festivities here in February. Mr. Whitney announced his determination to seek the South pole, starting on his journey in July or August of this year. He will take with him as one member of his party Captain Bartlett who was with Peary when he discovered the North pole. Mr. Whitney says he will not take the route chosen by Lieutenant Shackleton and his party of Britishers. He has not perfected his plans and will not do so for some time or until he returns to New York. Mr. Whitney has frequently visited New Orleans and is well known here. He has relatives residing in this city and is a member of some of the clubs here.

The State Game Commissioner has received a report from the warden in St. Charles parish to the effect that fifty-three deer were killed during the season which closed Jan. 1. Commissioner Miller thinks the reports when received will show that more deer were killed this season in Louisiana than last season. The season closes on different dates in the several parishes, some of them running as late as Feb. 1. Several deer have been taken by hunters in Orleans parish in which the city of New Orleans is located. The records or statistics are awaited with interest by the hunters. Quail have been more plentiful than for some years. A number of wild turkeys have been killed, but it is doubtful if the record will show a very large increase over last season. Ducks, geese and brant have been abundant, but the season as a whole has not been favorable for hunting them. Many visitors from the North and East are arriving here now and many will remain for Mardi Gras.

F. G. G.

Long Islanders for Spring Shooting.

ALBANY, N. Y., Jan. 17.—*Editor Forest and Stream:* Senator Long and Assemblyman Shields have introduced in the Legislature a bill amending the forest, fish and game law by changing the open season for ducks, geese, brant and swan on Long Island so that it shall extend from Oct. 1 to April 1, instead of from Oct. 1 to Jan. 1, as at present. The bill also extends to April 15 the time within which such wildfowl may be possessed. The present law makes such possession unlawful after Jan. 15.

Assemblyman Evans has introduced two game bills. One prohibits the hunting of hares and rabbits with ferrets in Sullivan county, and makes the possession of ferrets in that county presumptive evidence of their illegal use; the other bill prohibits the hunting of hares with ferrets, and makes the possession of ferrets presumptive evidence of their illegal use.

E. C. C.

BECAUSE of ill health, Professor Edward B. Voorhees, of New Brunswick, has resigned from the New Jersey Forest Park Reservation Commission, and Governor Fort has appointed as his successor William W. Smalley, of Somerset county.

Water Powers.

THE policy of New York State, with reference to the development of water powers, is fully set forth in a brief just issued by the New York Board of Trade and Transportation's Committee on Forests. The committee says in part:

It was due to the responsibility they felt as citizens which first led the New York Board of Trade and Transportation to seriously consider the vital relations and the value of the forests to the multifarious interests of the State and the importance of preserving them from destruction, and it was the action of this board which brought about the enactment of the Forest Commission law of 1885 under which a State policy was defined and the first State Forest Commission in this country was created.

At that time it was the hope of all of those who were interested in the preservation of our State forests that the law of 1885 and the creation of the Forest Commission would prove to be an assurance of the ultimate adoption of so-called scientific forestry, under State control. then believed to be the best means for attaining all desired ends. This hope has never been realized.

Throughout the entire State, and only excepting those in the forests who had profited by nefarious operations which were made dangerous, if not impossible, by this forest provision of the constitution [Article VII., Section 7], it was welcomed and regarded as the only sure means, under the existing conditions, by which the State's interest might be protected. This constitutional provision came into existence as the direct outgrowth of healthy and enlightened public opinion, and it has been maintained unchanged through the same force for sixteen years against repeated powerful assaults.

The persistency and unanimity with which the people of the State have supported Article VII., Section 7, of the Constitution is without parallel in the history of this State.

Besides the proposition to adopt scientific forestry, another object of the agitation has been to induce the people to approve a change of the constitution to permit, in the discretion of the Legislature, the creation of water storage within the forest preserve on State lands.

We have not been oblivious to the great advantages which would result to all the interests in this State from a comprehensive system of water storage development. More than twenty-five years ago we commenced to advocate the preservation of our forests and the creation of a State forest preserve for the purpose of conserving our water resources. At the same time we originated the movement for the enlargement of our State canals, believing then, as now, that the State of New York possesses within its borders the undeveloped means of affording its people and their varied interests the two most important factors which can contribute to the prosperity of commerce, manufactures and agriculture, viz.: cheap transportation and cheap power. With these provided the State of New York will be forever invincible as against its competitors in all its branches of industry. We promoted the canal enlargement to final success, and when the conditions warranted, we brought forward the legislation which would lay the foundation for the ultimate development of our water powers.

The State Water Supply Commission having practically completed its extensive studies and surveys made a report to the Legislature of 1910, setting forth in detail the results of its work and recommended the passage of two bills embodying a plan and a constitutional amendment which, if enacted and adopted, would have permitted the flooding of nearly 48,000 acres of State land within the boundaries of the Adirondack park. In fact, every project for possible water storage which had been proposed by the most enthusiastic advocates of water storage was provided to be carried out under the bills which were reported by the commission, and two of these bills were drafted by officers of this board, and to the other they contributed very largely by way of suggestion and amendment. Moreover, these bills were approved by Governor. Hughes and were formally endorsed by the New York Board of Trade and Transportation and by the Association for the Protection of the Adirondacks and by other associations and persons who had previously opposed any invasion of the Forest Preserve or any change of Article VII., Section 7, of the Constitution except as to the sale of lands outside of the Adirondack park. These bills were so approved because they provided for the maximum of water storage while giving no discretion to the Legislature or to any public official to go beyond definite fixed bounds and limits as to the flooding or use of State forest lands. But the bounds and limits fixed were so inclusive that, as has been stated, they insured the maximum of water storage desired, and much more than would probably be required for every practical use for several generations, if not for all time.

They provide that when the reservoirs were constructed by the State they were to be maintained and controlled by the State, and that the use of the waters from such reservoirs was to be leased under contracts running for terms of fifty years to the owners of the power plants and others, and at reasonable charges therefor, but such as would be sufficient to produce a net revenue to the State. The State was to provide the money by the sale of not to exceed twenty million dollars of State bonds.

These bills were defeated because members of the Legislature from the sections of the State which would be most directly benefited demanded that when the bonds of the State issued for the development had been paid off and retired at the end of fifty years, the State should turn over all the reservoirs it had built as a free gift and without any charge to the owners of the power plants for their own use, profit and enjoyment forever.

The question which confronts the people of the State of New York in this respect at this time is: Shall the State itself step into the field, take control, make this development upon the scale which the public welfare demands, and dispense the benefits thereof to all alike at the most reasonable charges consistent with public policy and the actual cost of rendering the service, or shall the State make the development and permit a great private or corporate monopoly to seize the control, dispense the benefits as it may elect and forever dictate the destiny of every other interest in this State?

Fortunately the people will not permit an in-

Bird Dogs in the Adirondacks.

GLENS FALLS, N. Y., Jan. 16.—*Editor Forest and Stream:* In his annual report transmitted to the Legislature this week, H. LeRoy Austin, the retiring State forest, fish and game commissioner, goes at some length into the conditions governing the deer supply of the State. It is recommended that the open season for hunting deer be continued as at present, or if any change is made that the season be lengthened to include the first two weeks in November with the restriction that no does be killed at any time. The protection of does, it is pointed out, would conserve both deer and hunters. The report says a hunter who stops before shooting to make sure that the animal at which he fires is not a doe is not likely to kill a human being.

It is recommended that suitable amendment should be made to the law which would permit the possession and use of dogs for legitimate purposes in the Adirondack section. It is stated that a proper system of registration of dogs could no doubt be made which would permit the use of dogs for bird and fox hunting. Through the medium of your paper, will you very kindly permit the undersigned to express their hearty approval and appreciation of the timely recommendations (as above stated) made by Mr. Austin to the Legislature upon his retirement from the office of State forest, fish and game commissioner? We particularly commend his recommendation relative to the use of dogs for bird and fox hunting, believing that the use of dogs under proper restrictions would be only fair and just to the bird hunter.

Birds cannot be successfully hunted without dogs, and as we find some of our best covers in the Adirondack preserves, the prohibition there of the use of dogs for birds, foxes and rabbits works a great injustice and hardship to the hunters of this game. The registration of dogs, with the name of the owner on its collar and the bonding of the owner, might prove a solution to the question.

The fox is almost, if not more, destructive to the grouse than the hunter, as they kill the mother bird on her nest and the young birds before they are large enough to protect themselves. Many grouse both male and female are also killed by foxes when the birds bury themselves in the deep snow for warmth in extreme cold weather. Exterminate the fox and there will be a large increase of partridge, besides protecting the poultry yards.

In permitting the use of bird dogs in the Adirondack preserves, under the above restrictions, the killing of deer will not be greater, as the bird hunters' weapon, a fowling piece with a load of 1⅛ ounce of small shot, would rarely if ever be effective if used on deer.

In expressing the above we believe that we have echoed the sentiment of Warren county citizens generally, especially those who have hunted in the Adirondack region.

SEA AND RIVER FISHING

An Early Trip With Bait.

It had been a long, cold winter and the Young Angler thought that real spring and the trout season would never come. Even on the first of April he could see big patches of snow on the north side of the Bald Eagle. Uncle Jim, who was always the consulting member of the trip and to whom the Young Angler resorted so frequently in his impatience, shook his wise old white head and said that spring was bound to come. He had never known it to fail, and went on preparing leaders, sorting tackle and getting things generally in order for the trip. Jake, who could go for trout only once a year, was getting so much pleasure out of the smoothing and fitting up of a new cane rod that he was in no hurry, and Flint, who would drive, hoped the spring rains would stop long enough to enable the mountain roads to become fairly passable.

In spite of the Young Angler's gloomy prophecy, the 14th of April found them on their way in Flint's big spring wagon with canopy top, drawn by a team of big bays. Uncle Jim wrapped in his great storm coat rode with Flint and discussed familiarly the affairs of the families whose homes they passed. The Young Angler and Jake rode on the rear seat, the one still impatient, and the other still impassive. In the space between seats were piled rubber boots, creels, bait cans, suit cases and Uncle Jim's old carpet bag. Under the rear seat was the lunch basket made of white oak splints and covered with a tightly-fitting oilcloth top. It was designed to fill snugly the place it occupied, and it carried food and utensils with which to prepare five big mid-day meals, if needed. From the rear of the wagon projected three long rods that proclaimed to the natives on the way that the fishing season would soon open.

It had rained steadily all the previous night and there was still a cold rain falling that slacked up occasionally to give a wider view of heavy clouds hanging low over mountains from whose deep valley arose clouds of fog. At Hemlock Inn at the mouth of Wallis Run the half dozen fishermen who had gone in the day before to be good and ready for the opening, and who were much disheartened over weather and the water, grouped themselves on the porch and jeered as the party drove past. Uncle Jim was not disturbed. He said that Providence was always on the side of the good fisherman and that the rain would keep the tenderfect at home and give the seasoned anglers more room.

Below an abandoned splash dam where the stream ran through shallow channels, Jake and the Young Angler donned rubber boots and filled the bait cans with several hundred minnows. They were the real trout minnows with small mouths and silver-white bellies. To Jake this was almost as much sport as catching trout. At noon Flint drove into a farmer's barn where the horses lunched from nose bags and the men from the basket.

Near the middle of the afternoon the road led out to the top of a high ridge at the bottom of which the party could see the little tannery village through which they must pass and the broad main stream whose waters they would fish miles above. The view was a pleasant one to men who were tired of people and paved streets. When they reached the little town that was to be their stopping place for several days, the big landlord came out to welcome them and to see that the wagon was unpacked and the suit cases carried to the proper rooms. Jake carried his minnows to some secret place where they would be kept in running water to be used only as needed. The long rods were handed up to be out of the way on the floor of the open porch that ran along the front of the second

MISS DELONEY AND A TWELVE-POUND TROUT TAKEN BY HER IN SNAKE RIVER, WYOMING.

Photograph by G. W. Ridge.

story, and the fish baskets and boots found their accustomed places in the office.

After a bountiful supper the party gathered in the office where Uncle Jim found acquaintances of many years' standing, who knew that he would be on hand at the opening of the trout season. The landlord sat in an enormous chair near the door of the bar room ready to hook his cane into the collar of any man who in his judgment had drunk enough for one day. No man that neglected his family could drink at that bar and no man could buy a bottle of liquor on which to become intoxicated. When the log drive passed the village, the bar was closed for two weeks and no driver drank up his wages in that house, filled the air with profanity, and cut the carpets and floors with caulked boots. The landlord was so big and so determined looking that his decisions were final in every corner of his domain. Uncle Jim thought that if all hotels could have such landlords, the drink problem would be solved. After the landlord had shown the party his fishing tackle and had gone out to see that an early breakfast would be ready, the Young Angler wanted to know how so big a man could possibly get along the streams. Uncle Jim said that they loaded him and his chair into a wagon and drove up the middle of the creek and the landlord fished over the tail-board of the wagon.

It had been decided that the first day should be spent on the East Branch of Middle Creek near the mouth of Double Run, and here they found a shed for the horses and a structure resembling an Indian wigwam in shape made of new lumber, in which they could be protected from the storm when not fishing. In the center of this was a place for a fire. Uncle Jim went up the creek to the pool from which one day many years before he had taken seventy-five trout that averaged a foot in length. Jake and the Young Angler tried Double Run, and from each little pool they found they could get one and sometimes two nine-inch trout. In a deep pool at the bottom of a six-foot fall Jack got a vicious bite. His rule on such occasions was to fill and light his pipe before pulling, and when he landed a fourteen-inch trout with the minnow and hook in its belly, he was again confirmed in his practice. It was a broad heavy trout that had evidently spent its life in the rocky pools under the hemlocks of Double Run, and the coloring of its dark brown back, steel blue sides and pink belly was entirely different from that of the lighter colored trout of the main stream.

At noon each angler reported nearly a dozen trout, a fair catch for such a cold wet day. Uncle Jim had caught fewer than either the other two, but his trout ran a better size. While the Young Angler made a pot of strong coffee and broiled a slice of ham over the coals of the fire, Flint had kept going for his own comfort, Uncle Jim and Jake cleaned the trout and packed them in a splint basket to be placed in the ice house at the hotel.

The afternoon was spent in fishing down the main stream to the village. The Young Angler at one place found some trout in the shallow water, a very unlikely place for trout so early in the season, and he had an hour's good sport. Under the bridge a mile above the village in a pool of great depth Jake caught a number of good trout by dragging his minnow close to the bottom. In the beautiful oval pool just below, Uncle Jim said, he had seen on a warm evening in June a hundred trout rising at one time and a fly-fisherman busy with big trout.

That evening Shorty Russell who had walked in from miles back in the mountains to shake hands with Uncle Jim, told how in fishing between Sandy Bottom and the Cove he had overtaken an angler whose bait at every cast was hitting the stream with a great splash. He was a man from the city who was too near-sighted to do much fishing, but who occasionally went out on such trips. His bait was a big stone catfish so attached to a large hook that no amount of slashing would throw it off. Shorty asked who had put it on, and when Tom replied that

it had been done by Uncle Jim, who was just around the bend and who had said that it was the best bait in the creek, Shorty laughed until he finally fell into the creek. It still appealed to him as the funniest thing he had ever met with. Uncle Jim said that as Tom would not catch anything, he might just as well fish with one thing as another, and as he did not want the minnows wasted, he had rigged Tom up so that he would fish away contentedly all day with one bait. Uncle Jim retaliated by telling jokes on Shorty, and so the evening went until Flint, who always cried when he laughed, was too weak to sit up, the landlord had shaken his fat sides until they were sore, and the audience had listened to a performance that the city vaudeville could not surpass.

In the morning a cold rain was falling. Uncle Jim advised fishing the East Branch again. At the mouth of Pole Bridge Run the party instructed Flint to drive back to Double Run where they would meet him at noon. The stream bottom here was so filled with boulders that it was necessary to watch every step. There were few gravelly bars and frequently it was impossible to reach the next pool without going far up and around on the mountain side. At a long shallow pool Uncle Jim and the Young Angler competed in leading out trout that seemed not to vary a quarter of an inch in size. But Uncle Jim, who never saw his peer with a minnow, won easily. CHARLES LOSE.

[TO BE CONCLUDED.]

Fishing and Canoeing.

SYRACUSE, N. Y., Jan. 12.—*Editor Forest and Stream:* We usually go to the Adirondacks on a camping and canoeing trip each summer. We ship our canoe to Old Forge or Raquette Lake. There is fine canoeing from either place, but the fishing is not good either for trout or bass. To get the former one must make side trips. At Eighth Lake we went over to a creek near Morgan's preserve and caught ten to twelve fair sized ones, seven to ten inches long. We caught twelve to fifteen in John Brown Inlet near Eighth Lake. We also found some in Bug Lake on the Morgan road, north of Eighth Lake carry. Good catches may be had in Boulder Brook entering Raquette Lake on the eastern shore north of Wood's Point.

I gave up my canoe trip through Raquette River from Raquette Lake to Potsdam because of so many discouraging replies from city people, but when too late I found they were tenderfeet and that the carries were no worse between Tupper Lake and Potsdam than in the river from Raquette Lake to Tupper. The log jam, etc., they told about were only waste timber they climbed over because they did not find the trail.

We took the train from Raquette Lake to Clayton and the ferry to the A. C. A. camp at Sugar Island in the St. Lawrence, where we spent a most enjoyable week on the island with the Association, of which I am a member. We camped there in our canoe tent as we did in the Adirondacks, got our own meals, etc., although many ate at the mess tent of the association. The fare from Raquette Lake to Fulton Chain is 95 cents, to Clayton it was about $3.29; ferry, 50 cents to Sugar Island; return ferry, 50 cents; railroad fare, Clayton to Syracuse, $2.24. Total for round trip, $9.00 each and half price for the boy. C. H. MATTISON.

"Well, Sir! Once—."

III.

"Well, sir, once I saw an amateur fishing off the city dock that played high hook right," said the next man. "Lot of people out fishing and looking on, and he came down with a big tin tackle box, evidently borrowed from some fisherman friend, as he did not seem to know the rudiments of the game. Hunting out a line, apparently rigged for fresh water fishing, the hook tied to the line without wire snood or other protection from teeth of salt water fish, he looked about until he found a bit of stale mullet someone had left lying on the dock. Baiting with this he pitched the hook out into the water, getting the line well tangled in the effort. Pulling in he tried again, with no better success. The next effort sent the bait in a tangle over the rod of a man fishing near by. Another effort resulted in knocking off a spectator's hat. Every one on the dock was laughing at him, but he was too busy to notice them. He kept right on swinging and casting, fouling some and striking others, until he had cleared a space around him and had the end of the dock to himself. Then, as the bait happened to remain in the water for an instant, the unexpected happened. The line went out with a whiz, burning the man's hands the first rush. He let out a yell, and then began the wildest rough and tumble fight I ever saw with a fish. It was evident to all that he had something unusual hooked, and his method was as unusual as his fish. All over the dock he went, dragging, jerking, pulling and hauling, losing and gaining line, but never letting go, although some of the rushes cut his hands badly and the pain was intense. The fighting was as savage as though the man was tied to a lusty yearling calf, and I never could understand how the line stood the strain. Every time line was gained the man would shout for joy, and then when a particularly savage rush took it through his hands, he would howl. I looked on from a safe distance and was astounded to see the end come suddenly and in the most unexpected manner. With a sudden rush and swing that looked like it would have broken a shark line, the man yanked out of the water and threw well back on the dock a magnificent sergeant fish weighing not less than twenty-five pounds.

"We were around him in an instant, but he gave us little time to admire the fish. Wadding up the line and thrusting his damaged hand into the gills, he snatched up the tackle box and went up the dock in a run. A boy who followed him returned soon with the information that he did not go to a doctor, but was at a photographer's, having his fish and himself taken in every pose possible."

"Speaking of amateurs," said a little man who had heard the story, "I saw a man who had never caught anything larger than a perch catch a kingfish and a good one, too. Now, I have been up against nearly everything in the water, except whales, and I don't know anything that gives a man much more for his money than a kingfish. This man came on the ocean pier at Lake Worth one morning when nothing much was doing, but he wanted to fish. The tackle man on the pier sized him up and fitted him with a heavy outfit, baited for kingfish or amberjack, cast out, and not expecting any result, promptly dismissed him from mind. The man lighted a cigar, and leaning comfortably against the railing proceeded to enjoy the beautiful ocean view and the company of his wife. A few small fish had been caught, but there had been no signs of anything large about, and I was much surprised to notice a strike on the newcomer's line. The fish was going off strong before he observed it, and when he did, he jerked, just as he would have done had he been fishing in the creek at home. He hooked, and the first rush was made with the line running free, the man being too much surprised to handle the reel at all.

"No two fish ever do exactly alike, either in biting or fighting, and this one did the unusual by making a short run and allowing itself to be turned at once when the man began to reel. It came in sluggishly for quite a ways, and I had just about concluded that it was no fighter, when there was a savage rush, the reel screamed, and the man banged against the railing. His hat flew off, and he nearly lost the rod, but rallying quickly, he held on. Feeling for the reel, he got a rake that brought the blood from his right hand, and an attempt to thumb burned the left thumb to the quick. He seemed about out of commission, and I knew the fight had not really started yet. Getting the reel again he was recovering a little line, when a rush struck the rod, held high, and he got the butt in the pit of the stomach, causing him to double up with a grunt and lose his cigar. The next rush took him against the railing again, knocking off his glasses, and most of the remaining breath out of him. His wife, wildly excited, was running around, trying to assist.

"The man tried to back out on to the pier after the second collision, and fought for a few moments without further damage, but a particularly savage rush took him again hurling toward the railing. His wife tried to stop his wild career by holding him around the waist. His only idea of handling the fish seemed to be to hold hard and I never saw a man so severely punished by a fish. He was game all right, and his wife, though scared almost to death, was trying her best to help him. Finally between them, never once doing the right thing, and both utterly used up, they actually tired the big fish out and dragged him up to the pier where the tackle man gaffed it. The little woman broke down and cried when she saw the condition of her good man. Both hands were bruised and cut; hat, glasses and cigar gone. He was a good sportsman, though. 'Never mind, dear,' he said, as soon as he got breath. 'Come and see the nice fish we caught.'"

LEWIS HOPKINS.

This Mackerel Not Shy.

"AN absolutely true fish story" was related by Captain Lewis, of the schooner Antoinette, which put in at Vineyard Haven the other day while en route from Florence, N. J., for Boston, says the New York Fishing Gazette. One night when fifteen miles southwest of Fire Island, Antoinette sailed through large quantities of mackerel schooling on top of the water. One of them, eighteen inches long, jumped over the rail and landed on deck. Members of the crew immediately laid hands on the fish and soon enjoyed a mackerel breakfast.

Anglers' Club of New York.

THE annual meeting and dinner of the Anglers' Club of New York was held on the night of Jan. 10 at the Hotel Navarre. About 100 members and their guests sat down to the banquet, which was served under a huge tent lighted by 600 electric lights—a feature that surprised and delighted the anglers, partly for the reason that its design and equipment were the work of William T. Morrison, chairman of the dinner committee, assisted by G. M. L. LaBranche, C. H. Higby and Edward B. Rice. The menu card, the work of Mr. Higby, had on its cover a wonderfully realistic scene along a brook, with an angler in the act of retrieving a fly.

Among the speakers were the Rev. Henry Van Dyke, William Loeb, Jr., Collector of the Port of New York; Commodore J. U. Gregory, Raymond L. Ditmars, Curator of the New York Zoological Park; William A. Babson, Robert B. Lawrence, William T. Morrison, G. M. L. LaBranche, Dr. Robert T. Morris and Robert Davis. Mr. Ditmars illustrated his talk on "Snakes Often Met With by Anglers" by exhibiting a number of live specimens. Dr. Van Dyke told some pleasing stories and dwelt on the benefits and the pleasures of angling. Mr. Morrison illustrated his remarks on "Bass, Maskinonge and Lake Trout Fishing in Ontario" with beautiful lantern slides.

At the business meeting which preceded the dinner, the following officers were elected for the ensuing year: President, G. M. L. LaBranche; Vice-President, William N. Hardy; Secretary, Jason G. Lamison; Treasurer, Harry Friedman; Directors, in addition to the above, Nathaniel H. Smith, Harold G. Henderson and John L. Kirk; Committee on Admissions, William T. Morrison, E. C. Evans, Perry D. Frazer, William H. Zabriskie and A. B. Hubbell.

Pennsylvania Fisheries.

THE Commissioner of Fisheries has handed his report for the year 1910 to Governor Stuart. The report of the Department is one of the most eagerly sought for of all public documents, and this for 1910 contains matter of unusual interest. The output of fish during the year was 1,078,991,085, of which 839,397,700 were chiefly food fishes and 239,593,385 were exclusively game fishes, showing that the Department's greatest efforts were toward the increase of fish principally used for the market. Of the 239,593,385 game fish, 226,100,000 were pickerel. There were 424,868,200 yellow perch reared, 143,750,000 blue pike, 120,083,000 lake herring, 92,279,000 pike perch, 38,250,00 white fish and 19,000,000 shad. The output of brook trout was 13,134.90, the greatest output in the history of the Department. Of the total output 989,512,000 or all but 89,479 085 fish were the direct result of field work or the gathering of spawn which would otherwise have been destroyed. This work the commissioner in his report pronounces the most valuable and important of the work of the year. The eggs of the shad, white fish, lake herring, pike perch and blue pike would have all been lost had the Department not stepped in and taken the eggs from the fish which were caught in the nets for the market. Most of the eggs of the yellow perch and pickerel—except about 5 per cent.—would have been devoured by other fishes.

The fish wardens made 280 arrests and secured 255 convictions. There were only twenty-five acquittals and twenty-three appeals. The fines imposed by the magistrates amounted to $6,074 of which more than half has been collected and paid into the State treasury. About $2,100 were either served by the defendants in jail sentences or are held up by appeals.

Two hundred and thirty-seven industrial establishments were notified to cease flowing deleterious waste into the stream. Of these 105 were sawdust; creameries, 16; dye houses, 11; general pollution, 33; pumace, 11; gas houses, 7; tanneries, 17; paper mills, 6; salt water, 14; acid, 10; lime, 2; chemicals, 5. In addition to the above, one concern having over fifty tanneries was given notification covering all those plants.

The commissioner in his report recommends an appropriation to start the new Presque Isle Hatchery; to establish a water farm on which to experiment with aquatic animal life other than fish, such as frogs, fresh water terrapin, pearl mussel and the like; an appropriation for the rebuilding of the Erie Hatchery, and for extensive improvements at the Crawford Hatchery, and an increased appropriation for the expansion of field work; also to turn over to the Department of Fisheries for field work purposes and public fishing certain lakes the title of which are held by the Commonwealth, and to permit the Department to purchase access thereto by right of Eminent Domain if necessary; also that the Department have the right to purchase certain streams in the State for public fishing purposes; and the enactment of a bill for the better protection of frogs and terrapin.

Fishing Clubs.

SAN FRANCISCO, Cal., Jan. 10.—*Editor Forest and Stream:* The California Anglers' Association, the largest body of amateur anglers on the coast, has at last moved downtown from the Geary street quarters taken following the fire, and is now firmly established in handsome and commodious headquarters in the Dunne Building at Ellis and Stockton streets in the heart of the city. The association is already a large one and new members are being added at a rapid rate.

Winter fishing in California has not been up to the usual standard this season, especially in the vicinity of San Francisco, due largely to the failure of the striped bass to materialize as usual. But few fish have been taken in the sloughs that formerly were favorite fishing grounds, and most of those taken have been from new grounds at a considerable distance from this city. In the vicinity of Napa some good fishing has been enjoyed this season, but of late when the San Francisco delegations were commencing to make trips there, the sport has shown a falling off. Some large fish have been taken there, and even now the chances of taking fish are better than they are on Wingo or San Antonio sloughs.

On the Russian River some good catches of steelheads have been made of late, but the run there is very erratic. The best fishing of this character is to be secured in the tidal waters in the vicinity of Point Reyes. Large fish are not often taken there, but a basket of medium sized ones can be secured at almost any time.

The Fisherman's Club has been incorporated at Los Angeles by J. J. Martin, R. E. Glaze, E. G. Huling, W. Osborne, J. A. Brenner, C. D. Younken and T. C. Horton.

A new ordinance has gone into effect in Santa Cruz county placing a limit of seventy-five on the number of clams that may be taken by one person in a day. Heretofore these shell fish have been taken from the beds by the wagonload.

A. P. B.

A Ruinous System.

NEW ORLEANS, La., Jan. 14.—*Editor Forest and Stream:* Game Commissioner Miller has returned from an inspection of the oyster reefs and beds near St. Bernard parish and he openly advocates the abolition of the steam dredging boat, declaring that this dredging system is ruining the oyster beds and reefs. Mr. Miller declares that Louisiana has 146,500 acres of oyster land near St. Bernard parish and as a result of the dredge boats the beds are denuded and ruined. He advocates the leasing system. At the present time there are only 1,088 acres leased. The question will be brought before the commission at its next meeting, although nothing can be done this season for the reason the commission consented for the dredge boats to gather oysters until the close of the present season. It is claimed that under the leasing system each lessee will seek to build up his oyster bed year after year and make them productive instead of taking all the oysters away each season.

The moderate weather of the past few days has encouraged the fishermen, and several have gone over to Lake Catherine, Chef Menteur, the Rigolets and other fishing places and met with fair luck. The waters are most too cold for successful fishing at the present time, but some redfish and green trout are being caught. It is expected that fishing will improve shortly and many visitors will try their luck. F. G. G.

New York Fishing Club.

THE New York Fishing Club held its annual election for officers on Jan. 10, with the following result: President, Frank Wallach; Vice-President, Nicholas Engel; Treasurer, Joseph A. Hassmer; Financial Secretary, A. H. Tiemeyer; Corresponding Secretary, William C. Uhl; House Committee, Frederick P. Kafka, Charles H. Graham, Frank H. Peterman; Finance Committee— Henry Fisher, H. W. Bohmfalk, Charles F. Berg; Trustees, Charles Shortmeier, George W. Fennell, Henry W. Miller, James E. Engel, "Botanikah," John H. Loos.

The club has commodious buildings and extensive grounds on Raritan Bay, near Tottenville, Staten Island, and is one of the oldest and most successful organizations of its kind in the greater city. It was chartered in 1883.

Walter Welch Reinstated.

CAPITOLA, Cal., Jan. 9.—*Editor Forest and Stream:* At a meeting of the honorable board of supervisors of this county, held in the city of Santa Cruz, on the 4th of January, 1911, I was reappointed to the office of fish, game and fire warden of Santa Cruz county, California.

Perhaps you will recall that I was removed from said office in May, 1909, without notice, or any charges having been filed against me, and that your valuable paper made mention of the fact at the time. WALTER R. WELCH.

YACHTING

Some News and a Little Gossip.

It has been rumored that G. Cecil Whitaker, who is now having a large racing schooner built from designs by Fife, is considering bringing the yacht to these waters to race. This vessel was built to meet Westward, which was so successful last season, and now that Westward is said to be ordered home for racing here Mr. Whitaker will miss the opportunity of racing against that yacht unless he follows Westward with his new yacht. It was suggested in this column a few weeks ago that British yachtsmen should pay a visit to these waters, in return for the many visits that as Meteor, Germania, Suzanne and other vessels Several season have been made successful abroad through American yachts, and those yachts would have done much to help the sport at home had they raced in these waters. At home Mr. Whitaker will find only such craft as Meteor, Germania, Suzanne and other vessels of more or less ancient vintage, which were all beaten by Westward, and not much glory can be gained by beating them again. On this side there will be the Plant new yacht; Westward, Irolita, formerly Queen; Enchantress, the new yacht built for W. E. Iselin; Karima, building for Robert E. Tod, and others, and to win from such a fleet will be something to be proud of.

There is one thing though that might stand in Mr. Whitaker's way. On this side of the Atlantic there is no long schedule of races for such vessels as the Class B schooners like there is on the other side, and it is consequently difficult to get a crew of good sailors to spend the season away from home, because the men lose so much in prize money. If some of the prominent yacht clubs would get together now and arrange a schedule of racing events for the 96-footers, it is very probable that Mr. Whitaker would see his way clear to coming to this side of the ocean and enjoying a season of good sport.

One progressive club has already suggested a long distance race for the schooners Atlantic and Karima. These vessels are rigged with three masts, and a cup has been offered for a race around Long Island. The owners of these two yachts are said to be willing to compete, and it is very probable that other large craft will enter.

Horace E. Boucher, who has been chairman of the regatta committee of the Atlantic Y. C. for three seasons, will this year be chairman at Larchmont. He will succeed Charles P. Tower, who has held the position for many years. Commodore Leonard Richards last week in General Orders No. 1 announced his appointments. J. D. Probst, formerly vice-commodore at the Atlantic Y. C., is fleet captain; H. E. Smith is harbor master; Dr. W. E. Bullard is fleet surgeon, and the Rev. Richard Cobden is fleet chaplain. The regatta committee is Horace E. Boucher, A. Rutledge Schmidt and Butler Whiting.

There will be another series of races this year for the Manhasset Challenge Cup, won last year by Stuyvesant Wainwright's Cara Mia, representing the American Y. C. The Seawanhaka Corinthian Y. C. has challenged for a race, and a committee of that club—H. M. Crane, Johnson de Forest and Sherman Hoyt is to superintend the building of the challenger and sail her in the races.

The Manhasset Bay Y. C., the original donors of the cup, will also be represented in the races. A committee of members of that club is at present trying to arrange a syndicate to have a 31-rater built.

The annual meeting of the Harlem Y. C. was held last week and the following officers and committees were elected: Commodore, Fred B. Bragdon, sloop Amorita; Vice-Commodore, William F. Burrough, power yacht Ruth II.; Rear-Commodore, Philip J. Fox, sloop Kathryn; Secretary, Edward Schmidt; Financial Secretary, Joseph C. Fegan; Treasurer, Edward J. Martin; Chairman Race Committee, Walter S. Sullivan; Measurer, John Wimmer; Fleet Surgeon, Dr. T. A. Martin; Trustees, class of 1911, William Strauss, Joseph J. Lyons, John F. Jarchow. Class of 1912, Edward M. Hartman, Karl F. J. Seifert, Henry M. Shember.

The following appointments of delegates and committees have been made: Fleet Captain, M. J. Earley, Jr.; Race Committee, Walter S. Sullivan, chairman, W. J. Fowler; House Committee, Edward M. Hartman, chairman, John F. Jarchow, Joseph J. Lyons; Membership Committee, William Strauss, chairman, K. F. J. Seifert, Henry M. Shember; Entertainment Committee, Frank D. Shea, chairman, J. F. Proctor, William T. Hyde, Dave Reed, John A. Crowley; Delegates to Yacht Racing Association of Long Island Sound, Walter S. Sullivan, John Wimmer; Delegates to American Power Boat Association, Arthur Miller, George W. Jarchow.

The newly elected officers of the Horseshoe Harbor Y. C. are: Commodore, George H. Sutton; Vice-Commodore, Sidney T. Clulow; Secretary, Richard C. Heather; Treasurer, C. C. Gould; Trustee, T. J. McCahill, Jr.

The Hartford Y. C. members met last week and elected officers for the year, as follows: Commodore, Charles A. Goodwin; Vice-Commodore, Francis R. Cooley, Rear-Commodore, Charles H. Symonds; Treasurer, John Ernest Stewart; Secretary, Edward B. Barker; Trustees, Hubert L. Maercklein, Joseph Merritt; Race Committee, Harry D. Olmsted, chairman, Marcus A. Potter, William J. Crosley, Everett E. Dickinson, Henry L. Huntington, Frederick E. Innes; Delegates to Yacht Racing Association of Long Island Sound, Harry D. Olmsted, chairman, Marcus O. Potter; Delegates to American Power Boat Association, William J. Crosley, chairman, Henry L. Huntington, Delegates to Eastern Yacht Racing Association of long Island Sound, Charles A. Goodwin, chairman, Charles Noel Flagg, Marcus A. Potter; Connecticut River Improvement Committee, Karl E. Peiler, chairman, Robert S. Brown, Charles D. Francis, Charles H. Symonds, Harry R. Williams, Julian S. Allen, Gilbert F. Barby.

The yachtsmen from the southeast end of Long Island are to have a catboat to take part in the inter bay races this summer. These yachtsmen took part in the conference at Providence last year, and while they agreed with the rules, as framed, they said that the type of boat turned out under those rules would not be servicable in their waters, because they are so shoal. They admitted, however, that the type would be a good one for racing in deep water. Now several of those yachtsmen, among whom are the Growtages and Foster Crampton, are forming a syndicate and will build a boat to go to Marblehead. They will have some fun. They may win the cup, but whatever they do will be for the good of the sport. Gil Smith will build the new craft and it is sure to be a fast one.

At the meeting of the Corinthian Y. C., of Philadelphia, last week, it was pointed out that the steamers May, Margarita, Venetia and Ednada II. had been recently sold out of the club. The loss of four such craft is a serious one, and cuts down the club fleet considerably in number of vessels as well as in tonnage. In addition to these four the sloops Halai, Bronco, Kuvana, motor boats Dixie and Garnet and schooners Irolita and Edna have been transferred to other clubs.

The fleet has, however, been increased by the schooner Queen, purchased by Commodore Clark; Whim, the auxiliary schooner owned by Clement Griscom, George E. Bartol's bug eye schooner Bonheur, W. Barklie Henry's sloop Dorello, J. Kent Kane's motor boat Madge, Walter Lippincott's motor boat Ariel, Meredith Colket's motor boat Unome, A. J. Drexel Paul's motor boat Sea Wolf and Clement A. Newbold's motor boat Pampeno. The fleet of the club now comprises 119 yachts, of which 8 are schooners, 12 auxiliary schooners, 26 sloops and yawls, 9 auxiliary sloops and yawls, 7 raceabouts, 8 open boats, 15 steam yachts, 33 motor boats and one houseboat.

In the racing season the raceabout Quakeress III. scored 4 firsts and 3 seconds out of 8 starts. The Typee started 11 times and was 5 times first and twice second. The Tomboy was once first out of 14 starts, the Cyrilla 3 times first out of 5 starts and the Ellanor once first out of 6 starts. Grilse III. did not win a race. The score of points in the spring series of races was Quakcress III. 31 points, Typee 30, Tomboy 24. Grilse III. 8, Ellanor 7. In the second series the score was Cyrillo 21 points, Ellanor 17, Tomboy 17, Typee II. 11 and Grilse III. 4. The election of officers resulted as follows:

Commodore, E. Walter Clark, schooner Irolita, formerly Queen; Vice-Commodore, C. Howard Clark, schooner Savarona; Rear-Commodore, Robert Toland, schooner Dervish; Secretary, Addison F. Bancroft; Treasurer, John A. Inglis; Measurer, George Breed; Race Committee, Addison F. Bancroft, George Breed and Charles Longstreth; Trustees, George E. Bartol, Dr. Hobart T. Hare and Robert L. Forest.

William L. Carleton, the hard working chairman of the regatta committee of the Corinthian Y. C., of Marblehead, at the annual meeting last week made a most interesting report. Twenty-one regattas were sailed during the summer, in which the total number of starters was 685 yachts. In the mid-summer series of four days 528 yachts started and the largest number in one day was 150, on August 4.

The South Boston Y. C. elected the following officers at their annual meeting: Commodore, John F. Burke; Vice-Commodore, John J. Tobin; Rear-Commodore, Leon T. Allen; Secretary, Theodore L. Kelly; Treasurer, William X. McKee; Measurer, Arthur F. McGarry; Trustees, William F. Cogan, James Bertram; Club Surgeon, Dr. Charles R. Rothwell; Regatta Committee, Howard Garnett, John J. Harland, Harvey R. Schadt, Thomas J. Burke; House Committee, A. L. Scherer, James P. Holland, Charles H. Hottelman, Alfred B. Linderman and William A. Ratigan.

The newly elected officers of the Columbia Y. C., of Boston, are: Commodore, Russel J. Huntley; Vice-Commodore, Joseph Spry; Rear-Commodore, Oscar Brambeck; Secretary, Alexander Moore, Jr.; Treasurer, George H. Carver; Measurer, James E. Hunt; Trustees, F. W. Frazer, John E. Hunt, J. C. Morgan, L. Tratton and W. J. Shepheard; Membership Committee, John E. Holland, James Matthieson, George Cobb; Auditors, L. Masters, George Brigham and W. Grose.

The Buffalo Y. C. elected these officers at its annual meeting: Commodore, Edward N.

A YACHT OF THE MANHASSET CUP CLASS.

Smith; Vice-Commodore, Robert H. Mason; Rear-Commodore, Edward Oldman; Secretary-Treasurer, Vernon A. Ellsworth; Measurer, Frank D. Wood; Fleet Surgeon, Dr. Elisha P. Hussey; Directors, Loran C. Davenport, Eugene C. Roberts, Edward Smith and Carlton H. White; Regatta Committee, John H. Carroll, Harry L. Nuese and Frank J. Wilson.

The members of the City Point Y. C. have elected these officers: Commodore, H. E. Carlisle; Vice-Commodore, R. P. Christian; Rear-Commodore, James Swift; Secretary, R. J. Bennett; Treasurer, G. A. Adams; Measurer, John Guest; Trustee, Thomas McClusky, 2d.; Fleet Captain, George Baldwin; Chairman Entertainment Committee, R. R. Christian; Chairman Regatta Committee, Thomas Plunkett.

The board of trustees reported the club in a flourishing condition, having gained thirty members during the past year. The club owns its own house and lot, has 150 members, 110 launches and ten sailboats.

Among the yachts to have new sails this season, made by Wilson & Silsby, are: Commodore Alfred Douglas's schooner Shiyessa IV., Robert Hale's sloop Thetis; George F. West's new 31-rater; Walter D. Wood's new 18-footer for Narragansett Bay; F. S. Eaton's sloop Nydia; E. E. Converse's yawl Albicore; John W. Bird's cutter Adeltha; L. H. Spalding's sloop Shearwater II.; Cyrus H. K. Curtis's steamer Lyndonia and M. B. Roche's sloop Dormie.

The steam yacht May was sold to Walter P. Bliss, through the agency of Ernest E. Lorillard, and Mr. Lorillard is watching the alterations being made on the yacht in the interest of Mr. Bliss. These alterations consist of new accommodations forward and aft, new decks, new bulwarks, new deck house forward, new plumbing and a general overhaul of machinery and hull. Gielow and Orr have planned this work.

The Stone Harbor Y. C. has elected these officers: Commodore, James Thompson; Vice-Commodore, Fred D. Biddle; Rear-Commodore, Ernest N. Ross; Secretary, Charles A. Farnum; Treasurer, William J. Jackson; Governors, John O. Gilmore, B. John Anchor, Henry Bassett, Robert J. G. Woods. Dr. George C. Signor and David Risley.

A new 46-foot sloop, building at Herreshoffs, is for Russell, Irving and Frederick Grinnell. The yacht will be ready by the opening of the season.

The new officers of the Haverhill Y. C. are: Commodore, William Walker; Vice-Commodore, Arthur Stacey; Rear-Commodore, Everett Palmer; Financial Secretary, Fredk. Richardson; Recording Secretary, Charles Palmer; Fleet Captain, Gus. Hudson.

Yachting in San Francisco.

SAN FRANCISCO, Cal., Jan. 10.—*Editor Forest and Stream:* The twelfth annual New Year's feast of the Corinthian Y. C. was held at the club house at Tiburon last week and was a decided success. Under the able direction of Port Captain John H. Keefe, the two hundred hungry guests of the club were waited on in an entirely satisfactory manner and the great quantities of ducks, geese, suckling pigs and turkeys that were disposed of attests to the excellence of the meal. At the meeting the proposition of building a new club house was given attention, and it is likely that these plans will soon be realized. Plans have been drawn, and to carry out these will require the expenditure of about $20,000.

The splendid weather that has been experienced on San Francisco Bay from early in November to the present time is causing many owners of yachts to wish that their boats were in commission. There has been scarcely a rainy or foggy day in the past two months, and the weather has been as warm as it usually is in the spring.

A. P. B.

Lighthouse Operated from Mainland.

LIGHTHOUSE keeping from the mainland is possible in the case of a new lighthouse on the coast of Guernsey, one of the group of islands in the English Channel. The light house contains a powerful fog siren as well as an acetylene light, and the lighthouse keepers are stationed at the electrical plant on the shore, more than a mile distant. The fog signal is worked entirely by electric cable, the turning on and off of the electric current on the shore automatically starting and stopping the motor and pumps which force air into the reservoirs. This compressed air drives an air motor, which in turn operates the siren.

The acetylene light is automatic, and will work for months without attention, the gas being automatically turned up at dusk and down at daybreak.

SENECA, CHALLENGER FOR FISHER CUP.

Lakewood Men Busy.

The Lakewood Y. C. will have a new Class R racing yachts for the coming season's sport. Cox & Stevens, of this city, have prepared plans for the boat and a syndicate has been formed to raise the necessary funds. George Q. Hall is looking after the financial end of the affair, and two subscriptions of $500 each have been made by Commodore Winton and M. Lyman Lawrence. The members of the club are anxious that the yacht should be built at Cleveland. The Lakewood Yacht Yard is anxious to get the contract, but no fin keel racer has ever been built there, and consequently the committee is doubtful if the work could be done satisfactorily.

The outlook for a fine season of sport is very good with yachtsmen about Cleveland.

Another Lakewood member, who has been a keen racing man for years, has recently sold his boat and announces that he has about decided to either buy or build a class R boat for next summer's racing. An inquiry has been sent to Lake Ontario, where there are seven or eight boats in the class, to see if any of the fast ones are for sale. There is nothing in eastern waters, as far as is known, which would stand a good chance of beating the boats building this winter.

The Lakewood Y. C. has received several new applications for membership the past week, one of the more prominent being Louis Johnson, owner of the cruiser Sunbeam II. and former secretary of the Cleveland Power Boat Club. Mr. Johnson is an enthusiastic power boat man and is expected to take an active part in the races at Rocky river next season. James Miller, owner of the cruiser Aurora, which won the long distance race of the Cleveland Power Boat Club last summer, has also joined the Rocky river fleet. He will be a strong contender for honors in the cruising class.

A. Y. Gowen's new high speed cruiser is rapidly nearing completion at Morris Heights. The boat will be ready for delivery about February 1, when Mr. Gowen expects to start on a trip to Florida and Cuba. It is understood, however, that the boat will not be taken south because the owner's business prevents, but will be brought to Cleveland as soon as the canal is open. The new Gowen craft is one of the finest pleasure yachts ever constructed at the Seabury plant. It is quite generally believed that her owner will be flying the rear-commodore's flag of the Lakewood Y. C. when he leaves New York in the early spring.

Origin of the Knockabout.

There seems to be a misunderstanding among yachtsmen as to the origin of the so-called knockabout rig, according to the Boston Globe. At least three designers have been mentioned in connection with the first yacht of that type.

The knockabout rig, however, originated in Marblehead just nineteen years ago this coming spring, when two boats that had been built at Gloucester for yachtsmen of that port arrived at that harbor early in the season. There were the Nancy, owned by Henry Taggard, and the Jane, owned by Herman Parker. A third boat of this type, the Trouble, was also under sail later in the summer.

As the Nancy was launched about three weeks before the Jane this yacht of Henry Taggard's was the first of the type. Mr. Taggard had been for several seasons sailing small sloops, cutters and catboats, none of which seemed to be just the type of small boat that he wanted.

Carrying the ideas of the type of yacht that he desired to the firm of Stewart & Binney, the Nancy, a small and handy pleasure boat of good draft with outside ballast, carrying a jibstay running to the stemhead, without a bowsprit, was the result.

The lines for this yacht and the Jane, which was ordered by Mr. Parker soon after were drawn by George Stewart, of the firm of which Arthur Binney, the well-known naval architect, is the surviving member. This was in the winter of 1891-2.

Both were built by Higgins & Gifford, of Gloucester, that winter and launched early in the spring. The Nancy took to the water about three weeks ahead of the Jane, and when each was ready to sail they were taken to Marblehead by Mr. Taggard and Mr. Parker.

This was the start of the well-known knockabout type of sailing yacht and so liked has the rig become that nearly all racing yachts of the present day of under 40-feet water line, are either knockabout or semi-knockabout rig.

The following year Mr. Taggard sold the Nancy to a Marblehead yachtsman, as he had built the Susan. In 1894 the Susan was replaced by the Esther, and some years later the Nancy was bought back by Mr. Taggard, who continues to be the owner of the original knockabout.

For a number of years, after 1892, the knockabout was the most popular racing class in Massachusetts Bay. The most famous of the 21-foot knockabouts built and raced was probably the Cock Robin. This yacht was designed and built by Herreshoff in 1896 for Charles S. Eaton, and in her races was sailed by William P. Fowle.

During her racing career the Cock Robin pactically was invincible. She was renamed Clithroe and owned by Walter S. Dean. The last racing of the knockabouts as a class was during the season of 1909 at Marblehead. That year Frederick L. Gay, of the Boston Y. C. offered a cup for the class with the hope that it would revive interest in the 21-foot knockabouts.

Four or five boats took part in the races at Marblehead of the Boston Y. C., and the cup was won by the Aspinet. Last year, although Mr. Gay renewed his offer of a cup to the regatta committee of the club, no class was provided for the knockabouts.

Of the two original knockabouts the Nancy and Jane, the Nancy is in existence laid up at the David Fenton Co.'s yard at Manchester. The Jane, up to the 1909 season, was used each year by Mr. Parker, but as the yacht was getting old and as he did not wish to place the Jane on the market, Mr. Parker had the old boat broken up.

Before breaking up the Jane Mr. Parker made a small model of the yacht complete in every detail. This he presented to the Corinthian Y. C., of Marblehead, and it is one of the prized yachting souvenirs of that club.

Universal Rule on the Lakes.

Commodore Bayard Holmes, of the Jackson Park Y. C., has written a short review of the last season on Lake Michigan and made some comment on the recent adoption of the Universal Rule of Measurement by the Association:

Lake Michigan has been the scene of many successful cruising races during the yachting season of 1910, but withal the most important development was that of the adoption of the universal rule by the Lake Michigan Yachting Association in February. It must be remembered that virtually every association in the United States had accepted the displacement rule and had been sailing races under it for from one to three years.

So many obstacles were in the way of its rapid use in Chicago that all races during the season were sailed under the old Sawanhaka measurement, but the prospects are that next season will see the beginning of what many sailors in Chicago think is an experiment, the universal rule as adopted by the Atlantic coast conference in 1906.

One looks with great regret at the passing of the famous Lipton Cup class into decay. Although the three races developed keen sport and considerable interest to the spectator, nevertheless it is now three years since a new boat has been built to the class, and it behooves the Columbia Y. C. to look around for a radical change somewhere. Spray again showed her all-round ability by taking another leg on the cup to the shelf of the Chicago Y. C., easily outsailing Susan II., or Jackson Park.

Valmore repeated her victory of 1909 by defeating the Amorita for the now famous Mackinac cup in a grueling run before a good breeze and accompanied by a big following sea. Commodore William Hale Thompson handled the big two sticker to a seaman's satisfaction and deserves great praise for his dual victories.

Beginning with calm and ending with a blow the Columbia Y. C. gave its annual Michigan City Derby. The little raceabout Invader won the time prize from a fleet of over forty of the best of the three Chicago clubs and the pick of the Macatawa Bay fleet.

The two days' racing around the Fourth of July over a triangular course was made the more spirited by the best of heavy-weather conditions. The winners in the nine different classes were evenly distributed between the Chicago, Columbia and Jackson Park fleets.

Illinois, the crack 35-footer, skipped by Roy Barcal, won a leg on the new Clorac Cup by three times, defeating the other 35-foters in the Fourth of July Knights Templar and Jackson Park regattas. This cup must be won three times by the same skipper instead of by the boat.

Three time prizes were offered by the generous Knights Templar for their regatta on August 11. The small boat division was won handily by the champion 20-footer Wenonah, the medium classes were led by Invader, while Vencedor annexed the large pitcher given to the winner among the big schooners, yawls and sloops.

Jackson Park Y. C. sailors again showed the most lively and spirited contests on the lakes. Their large fleet of smaller yachts raced every Saturday, from Decoration day till after Labor day, going to Indiana Harbor, Waukegan and Michigan City. Wenonah won the lion's share of cups and prizes, with the 21-footers Susan II. and Jackson Park evenly matched for second position.

Of great credit to the South Side club is the fact that the only new yachts built on Lake Michigan during the year were in their 20-foot class, to which three fast boats were added, making a fleet of nine to face the starting line.

In Deep Water.

He was an affable old gentleman, and, as he is dead, what I here relate may be looked upon as a posthumous anecdote. Among his delightful qualities was an ability, while traveling, to entice strangers into conversation, his innocent personality removing all feeling of impertinence from his remarks. This, together with the delicate interest with which he followed a story, however technical, only rendered his attention more flattering to the teller. The passion was of the Arabian Nights order, rather than one of curiosity or inquisitiveness, a desire to entertain and be entertained during the monotony of a journey.

Jonah would have interested him. I can imagine their meeting—Jonah, returning home with a ticket supplied by the Derelict Mariners' Society, being led to relate his trials, at the conclusion of which the quiet voice of the old gentleman would have been heard: "Then there are whales in the Mediterranean!" implying that he did not doubt the interesting story, coming as it did first hand, but, regarding the habitat of the whale, considered it a novel point, and one evidently overlooked by natural histories.

In this instance Jonah was a yacht hand, a trifle hard of hearing, returning from Southampton at the end of the season. Owing to a habit I have of dozing in trains I had evidently lost the opening gambit, so to speak, but roused myself in time to listen to the interrupted climax of the sailor's somewhat technical narrative.

"Yis, yis! As I was saying. We ran into a swell."

"Didn't you see him coming?"

"Eh! No. It was getting dark as we got

near the bar, an' the swell caught us under the counter just as——"

"Excuse me, but had you any right behind the bar at all?"

"No, not properly. That is, the old man was pinching 'er so as——"

"Pinching whom?"

"Why, Maud!"

"Tck, tck! One of the maids, I suppose. But where was your master, to permit such goings-on?"

"The owner? The old swell was lying on his bunk, sick."

"But I thought you said just now you ran into him."

"Who the boss?"

"No the swell'

"Ah! So we did, so we did; an' carried away a scuttle, two fenders, and the sweep."

"Dear me, how sad! A scuttle or a fender, more or less, can be picked up anywhere. But a sweep! Poor man!"

"This wasn't a man, mister, only a sweep."

"Only! Surely, at such a time, common humanity would prevent you making any distinction as to the calling the poor fellow followed."

"Yis, yis! But this one was only a ash sweep."

"I know you will pardon me, but the principle is the same. I cannot admit your distinction. I see no difference between a man who sweeps ashes and one who cleans chimneys," the old gentleman added pathetically.

The yachtsman, bewildered at the trend his tale was taking, looked patiently at me. But it was not my story. On the other hand, I felt afraid of a lull coming at such an interesting moment, so gave a fillip to the discussion by saying, "You were having a rough time, then?"

"We was, sir. We was in for a thick night. There was Maud in stays, jumping about the bar."

A blush spread over the old gentleman's face.

"She lay down, kicking 'er 'eels somewhat awful."

"Tck, tck! Disgraceful!"

"In the dark we couldn't see the buoy, though we was using glasses—("pint pots!"). Then in the middle of the jamboree Maud sat on the pram——"

The old gentleman's blush of outraged modesty turned to one of anger. "No wonder you couldn't find the boy!"

Ignoring this interruption, the yacht-hand paused, eyed him dramatically, as though spinning a yarn to a fo'c'sle audience, and in a husky voice added, "Then the painter went."

"Good Lord! A painter this time! How terrible—this callous sacrifice of the lives of two men and a little boy! But, tell me, was no one in charge?"

"Well, as a matter of fact, just at that moment Maud was in charge. * * * But there was the old man," the sailor added slowly—"the cap'n, you know. He sings out, 'Port!' * * * 'Port it is, sir! Hard up!' I shouts back."

"Just what I thought. Drunk, drunk as lords, and spend all their money," mumbled the old gentleman.

"So I shoves the 'elm over."

"What's that?"

"The oak tiller, you know."

"But you said elm."

"Well, the 'elm's oak. But, as I was saying, the skipper had his hands full trying to clear the sheets. They was all jammed.'

"Jammed! Dear me! Owing to the state you were in—tck, tck!—been using them for tablecloths, I suppose!"

"Eh? Tablecloths? I said sheets, mister. Didn't I say everything was all of a muddle an' the skipper was doing the best for Maud, so that——"

"Ah! I see. Just so. Very dense of me; and delicate of the captain, too, to think of wrapping a sheet round the—er—I think you said her name was Maud?—and so hide her—hm—what shall I say, *négligé?*—yes, her *négligé* appearance."

I explained to the yachtsman what I conceived to be the purport of the old gentleman's remarks.

"Oh! She was out of stays by this time!"

The poor old gentleman passed a handkerchief over his sunny face. Tactfully thrusting myself into the breach to cover his embarrassment, I asked her age.

"About nine years."

I felt, rather than saw, the old gentleman's shudder at such precocity. Continuing my diplomacy, I said, "After what you have told us, she must be of a fair size."

"Twenty ton."

That curled the old man up. I do not think, however, that he quite grasped the reply, as I overheard him muttering to himself, "Only nine years old and twenty stun. Abnormal!"

Gathering his belongings together, my aged friend alighted at his destination, then, turning to shut the carriage door, asked, in that tone one uses in closing a painful subject, "When did you see her last?"

"In the dock," replied the yachtsman.

"She richly deserved it!"—Percy Catton in Yachting Monthly.

New Boats by Alden.

John G. Alden, of Boston, has been busy drawing plans for several yachts, to be built for next season. One is a schooner for H. Wilmer Hanan, which is 70 feet over all, 50 feet on the water line, 16 feet 6 inches beam and 10 feet draft. This yacht is to be built in Mr. Hanan's private shop at Portchester, where an 85-foot cruising motor boat has just been built for John H. Hanan.

Richard McKean, of Sandusky, has ordered a 32-foot fishing ketch, which is to be fitted with a 10-horse-power gasolene motor. This craft is to be used for fishing on Lake Superior, and will be 32 feet over all, 27 feet on the water line, 10 feet beam and 5 feet 6 inches draft. The model is similar to that of a Gloucester fisherman.

Dr. J. C. Reynolds has purchased, through Mr. Alden's agency, the cruising yawl Cruiser III. from F. L. Smith, of Providence. The Cruiser III. is 61 feet over all, 41 feet on the water line, 15 feet beam and was built by H. Hanley Crosby, at Osterville, in 1903. A 20-horse-power Buffalo motor is to be installed.

Motor Boating.

Mackay Edgar's New Boat.

The new speed motor boat building for Mackay Edgar, who last summer brought the Maple Leaf II. here to try and win the British International Trophy, promises to be a wonder and must be treated with respect. The Yachting World has this to say about the boat:

"We all remember the exceedingly hard luck which followed the wake of our challenger for the British international trophy last year, Pioneer's being so monumentally the worse that one might almost forget the ill fortune of Mackay Edgar's 400 horse-power Maple Leaf II. in being too badly strained during a trial spin to start at all in the actual race. However, if all accounts, not to say predictions, are verified all this should be wiped out by the new 40-footer which Mr. Edgar is having built at Messrs. Dixon Bros. and Hutchinson's well known yard at Itchen Ferry. The new boat is to be a hydroplane of the same type as the famous Thornycroft 26-footer Miranda IV., but with a beam of nine feet, a displacement of five tons and fitted with two 12 cylinder motors of 400 horse-power, each driving twin screws.

"As to her probable speed, there seems to be more justification for reasoned argument than enthusiastic prediction—on paper—if only because such prediction is distinctly unfair to designer and builder alike if it should happen not to be borne out by results. If one chose to make prediction merely a matter of comparison of horse-power for tonnage, as seems

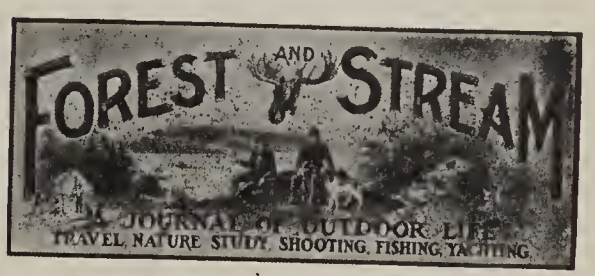
Canoe Handling and Sailing.
The Canoe: History, Uses, Limitations and Varieties, Practical Management and Care, and Relative Facts. By C. Bowyer Vaux ("Dot"). Illustrated. Cloth, 163 pages. Price, $1.00. New and revised edition, with additional matter.
A complete manual for the management of the canoe. Everything is made intelligible to the veriest novice, and Mr. Vaux proves himself one of those successful instructors who communicate their own enthusiasm to their pupils.
FOREST AND STREAM PUBLISHING CO.

My Friend The Partridge.
S. T. Hammond. A delightful reminder of crisp autumnal days in the covers. It tells of sport with the noblest of game birds, the habits and habitat of the ruffed grouse, with just the right touch of reminiscence and personal experience. Cloth. Illustrated, 150 pages. Postpaid, $1.00.
FOREST AND STREAM PUBLISHING CO.



CORRESPONDENCE.
The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. The editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.
Subscriptions may begin at any time. Terms: For single copies, $3.00 per year; $1.50 for six months. Rates for clubs of annual subscribers:
Three Copies, $7.50. Five Copies, $12.
Remit by express money-order, registered letter, money-order or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canada and Great Britain. Canadian subscriptions, $4.00 a year, $2.00 for six months.
Foreign Subscriptions and Sales Agents—London: Davies & Co., 1 Finch Lane; Sampson, Low & Co. Paris: Brentano's. Foreign terms: $4.50 per year; $2.25 for six months.

ADVERTISEMENTS.
Inside pages, 16 cents per agate line. Special rates for three, six and twelve months. Eight words to the line, fourteen lines to one inch. Advertisements should be received by Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money, or they will not be inserted. Reading notices, seventy-five cents per line. Only advertisements of an approved character inserted.

Display Classified Advertising.
Hotels, Summer and Winter Resorts, Instruction, Schools, Colleges, etc. Railroad and Steamship Time Tables. Real Estate For Sale and To Let. Seeds and Shrubs, Taxidermists. The Kennel. Dogs, etc. Wants and Exchanges. Per agate line, per insertion, 13 cents. Three months and over, 10 cents per line.

Solid Classified Advertising.
For Sale. Kennel. Property For Sale. Real Estate For Sale or To Let. Wants and Exchanges. Per agate line, 10 cents. Absolutely no display. No advertisement of less than three lines accepted. Cash must in every case accompany order.

FOREST AND STREAM PUB. CO.
127 Franklin St., New York.

to have been done, what do we find? First, that Miranda IV., weighing 2,400 pounds—that is displacing a little over a ton—made the best average speed of forty-one miles an hour on 120 horse-power. Now the new challenger's displacement is exactly 4.6 times as great, while her horse-power is 6.6 times as great; that is to say only about 30 per cent. greater in ratio. On what then is it claimed that this slightly higher ratio of horse-power to tonnage is going to drive her twenty-one miles per hour faster? Not on her fourteen feet additional over all length surely, for the known and admitted speed giving quality of length can hardly extend so far per se. Nor can even the fact that she is a hydroplane set all the theory based on practical observed results at defiance in this fashion.

"Besides, it is very much open to argument whether the planing efficiency of the Fauber multiplane type qua multiplane is not greater than that of the single step Miranda IV. type, still more than that of the earlier Lelas model, of which Flapper seems to have been the latest, largest and most powerful exponent. Also whether it is not likely to be more favorably manifested in larger craft of the two types. With such design and construction as Messrs. Dixon Bros. and Hutchinson invariably put into all they turn out it is safe to say before hand that Mr. Mackay Edgar's new challenger will be an uncommonly fast and able craft. But to predict for her a speed offhand of more than 55 knots on the strength of a comparison of tonnage and horse-power—with the latter only in a slightly higher ratio, which would not obviously hold good between two motor cars, let alone motor boats—seems to transcend the limits of sense as well as the privilege of comment. Even hydroplanes—albeit admittedly to a much lower degree—are still subject, after all, to the laws governing skin friction, the increase of power for every speed increase and so forth. Hence such predictions seem beyond justification, least of all to those whose reputation is idly placed at stake without their leave or warrant."

Novel Cruiser for Pacific.

Capt. F. B. Turner, a retired Yukon River steamboat man, has just launched an auxiliary schooner rigged yacht at Vancouver. The new boat has been named Chackawana, the Indian word for snowbird, and she will be the most notable addition to the fleet of the Royal Vancouver Y. C. The boat cost about $15,000 up to the time of her launching, but there will be many other incidental expenses that will run the total considerably over that figure. Chackawana measures 65 feet over all, with a beam of 24 feet, and will draw close to 6 feet of water with all supplies and stores on board. She is very solidly constructed, her keel, stem and stern post being of Australian spotted gum, a very hard and tough wood, even superior to oak in that respect. All the rest of the timber with the exception of the white oak frame and ribs is of native wood. The entire interior is finished in selected panelled fir.

Chackawana is unique in that she is fitted to be handled from three different places. Under power in fine weather she can be steered from a wheel on the bridge deck back of the pilot house. In wet or rough weather she will be handled from the cosey pilot house. When under sail she can also be steered from the cockpit aft. The main saloon has four Pullman berths and an extension dining table that can be opened to ten feet in length. The fittings are of red plush with velvet carpet to match. Two wardrobes and two handsome sideboards are also fitted in this room. The owner's stateroom is finished in old gold with carpets and curtains to match. A bathroom and lavatory adjoins this room with hot or cold, fresh or salt water available. There is also a library on board besides roomy wardrobes and an ingeniously fitted dressing table for the owner's wife.

The motive power will be a three cylinder, four cycle gasolene engine of 50 nominal horsepower, and was built specially for Capt. Turner by a firm at Bridgeport, who specialize in their engines on low fuel consumption. The engine room will be finished in imitation of Flemish oak and will have two separate gasolene engines, one for electric lighting and the other to drive the pumps for washing down decks, pumping out the bilge and driving the ventilating fan system, designed to force a current of cool air through all the cabins.

Large cruising radius as provided for by a storage capacity of 1,000 gallons of gasolene carried in a series of connected tanks placed below the floors. Besides keeping the weight low, and making the yacht steady in a seaway it assures steady supply to the carburetor, as gasolene is pumped up to a sight-feed indicator tank that feeds by gravity to the engine. There are also large tanks for fresh water, and a special power pump to provide salt water direct from the sea to the bath tub. The galley is a large bright and well ventilated apartment equipped with a gasolene range, the fuel being supplied from a tank carried on the deck above. There is also a gasolene coil heater, designed to heat all the water required for the boat as well as for the bathroom. The kitchen contains every up to date ingenious and labor saving culinary device, having also an ice chest and large refrigerator. Chickawana will carry a 12-foot rowing tender and a 14-foot power tender. These two little boats are named respectively This and That.

In her schooner rig the boat will carry about 1,500 square feet of sail in a jib, foresail and mainsail. This will be used in light weather and the masts and rigging are so arranged that they can be lowered to pass under bridges, as it is the owner's intention to do considerable cruising up the Fraser River and on Pitt and Harrison Lakes, as well as up the coast as far as Alaska. Next summer will be spent cruising along the coast, according to Capt. Turner's plans, and next winter he will cruise down the coast to Southern Californian waters.

Down the Mississippi.

New Orleans, Jan. 14.—*Editor Forest and Stream:* The little pleasure craft Lawrence arrived here during the week from Manitou Island, in Lake Michigan, in command of Mrs. Hass. With Mrs. Hass were Lawrence Hass, George Carter, Mrs. Carter and Miss Carter. The Lawrence is forty feet long and has an eighteen horsepower engine. The party left Manitou Island October 15 and came down the Mississippi river by easy stages and stopped at several points enroute. The little ship went on down the river to the gulf and returned to this city where the party will spend some time. The Lawrence is elegantly fitted up and every comfort is provided. It is probable the boat will be shipped back by rail. F. G. G.

Palm Beach Races.

The Palm Beach Power Boat Association will hold its seventh annual regatta on March 14 to 17. Efforts are being made to get a good fleet of racing craft to Florida. The endurance race, which has become the classic event on Lake Worth, will be held on Friday, March 17, and there will be many starters for the coveted Palm Beach prize of $2,500 in gold. This prize will become the bona fide property of that motor boat owner who first succeeds in winning two contests for the same.

The endurance race this year will be the second for this prize, the first leg having been won last year by the motor boat Dewey, owner W. F. Coachman, Jacksonville, Fla., which boat accomplished the distance of 119.18 miles at a rate of 24.8 miles an hour. The second boat to finish, The Jack Rabbit, owned by Hugh L. Willoughby, Jr., accomplished the distance at a rate of 23 miles an hour and finished 11 minutes 9½ seconds after the Dewey. The Eau Gallie, owned by G. F. Paddison, accomplished the distance at the rate of 20.7 miles an hour, making the last four laps at a slightly slower time than the preceding nineteen, but making a splendid record for herself notwithstanding same. The Diana, owned by George Gingras, withdrew in the early stages of the race, due to pump trouble.

In addition to the Palm Beach grand prize the Palm Beach cup, having an intrinsic value of $500, is for the motor boat exhibiting the highest average speed of six trials over the mile course on Lake Worth, and the association cup, also having an intrinsic value of $500, is for the motor boat winning the contest for the Florida designed and constructed boats.

The officers of the association are: President, H. M. Flagler; Vice-President, W. K. Vanderbilt, Jr.; Secretary and Treasurer, Leland Sterry, Palm Beach, Fla., and Chairman of the Regatta Committee, Theodore D. Wells, 32 Broadway, New York.

The members of the executive committee of the association are: H. C. Ward, Harrison B. Moore, James K. Clark, Lieut. H. L. Willoughby, H. E. Bemis, and the measurer, Clyde Yeomans, of New York.

Motor Boat Tests on the Elbe.

Vice-Consul James L. A. M. Burrell, at Magdeburg, in the Daily Consular and Trade Reports, says: "The Motor Y. C., of Germany, with which the Magdeburg Automobile Club is allied, is arranging for the latter part of May, 1911, a motor-boat tour on the Elbe, from Leitmeritz to Potsdam, similar to the last trip on the Danube, from Regensburg to Vienna. The trip is to be a test of reliability and endurance, without any speed contest whatsoever, and has been planned with the hope of increasing the use of motor boats on inland streams. A halt of a day will be made in Magdeburg, and the local automobile club and the city authorities are arranging for an appropriate reception."

Canoeing.

Canoe Club Elections.

The Buffalo C. C. last week elected these officers: Commodore, Edward L. Jung; Vice-Commodore, Charles H. Hurley; Fleet Captain, Harry V. Bisgood, Jr.; Secretary, Frederic C. Rupp; Treasurer, Charles A. Wolsley; Directors, C. Arthur Spaulding, A. Eugene Davenport, William J. Donovan, George Puls.

Following the election a buffet lunch was served. Each of the new officers made a short speech in which he outlined the work he proposes to do for the club. The reports of the retiring officers show that the organization is in a most flourishing condition.

The Gordon Place C. C., of Wisconsin, has elected A. J. Schinner, commodore; Arthur Hegeman, fleet captain; Fred Hientz, secretary, and William Otto, treasurer.

A. C. A. Membership.

Comparison makes superiority apparent. Place the products of Remington-U M C side by side with any others. Weigh their respective features. Consider how much each contributes towards safety and efficiency—the two prime factors that determine real worth at any price. Take past achievements as a criterion. Contrast the long line of successive and sweeping REMINGTON-U M C victories in competition with the record of any other make.

You can come to but one conclusion. Your own good judgment will tell you that REMINGTON-U M C firearms and ammunition stand out—**the most thoroughly efficient, safe and dependable of all.**

Here are just a few of the many representative REMINGTON-U M C features:

The REMINGTON-U M C **Autoloading Shotgun** solid breech, hammerless, allows five shots—ejects the empty shell, throws a loaded one in place and cocks the gun.
The REMINGTON-U M C **Pump Gun** solid breech, hammerless, the only bottom ejecting pump gun.
REMINGTON-U M C Shot Shells are the only American made shells that are steel lined.

Any dealer displaying the REMINGTON-U M C sign will gladly give you a demonstration. Ask him.

Remington and U M C—the perfect shooting combination.

March 6-11.—New York City.—International trapshooting tournament and sportsman's exhibition, Madison Square Garden. S. M. Van Allen, Mgr.
April 18-20.—Des Moines, Ia.—Iowa State shoot. Budd & Whitney, Mgrs.

DRIVERS AND TWISTERS.

The next shoot of the Hudson Gun Club of Jersey City is fixed to take place on Jan. 29.

Arrangements have been made for a team contest between the Crescent Gun Club, of Whitehouse Station, N. J., and the Star Gun Club, of Elizabeth, in connection with the tournament to be given by the Crescent Club on Feb. 11.

Secretary Maltby W. Conover writes us that Freehold, N. J., Gun Club will hold a target tournament on Jan. 26, commencing at 1 o'clock. The program will have a total of 200 targets, $16 entrance, class shooting.

By a total of 414 to 379, the Orange Gun Club defeated the Essex County Country Club in a team contest, ten men on a side, 50 targets per man. This was the first contest of a home-and-home series. The next contest will take place on the grounds of the Country Club in March.

Capt. C. C. Birdsall, Central Valley, N. Y., under date of Jan. 16, writes us that "We have just organized the Central Valley Rod and Gun Club, whose object is to co-operate with the other gun clubs of this section in stocking and protecting the streams and ponds, and incidentally to do a little shooting."

From press reports we learn that John Parker, famous as a trapshooter and athlete, died in Detroit, on Jan. 13. He was for many years a successful trade representative of ammunition manufacturers. His many friends will mourn his death, for he was a man of amiable disposition, loyal in his friendships, and industrious and able in his profession.

At a live-bird shoot of the Pottsville, Pa., Game and Fish Protective Association, Jan. 14, Fred Coleman, the famous expert, scored 25 out of 26. A two-man team contest, between Joseph Holahan and Frank Clemens on the one side, and John K. Schim and James Lynch on the other, 10 birds per man, the former won by the margin of one bird. The scores: Holahan 5, Clemens 4; Schim 5, Lynch 3.

The contest for the E. C. cup resulted in a victory for the renowned shooter, W. R. Crosby, of O'Fallon, Ill., in his match with Lester S. German, of Aberdeen, Ill. Crosby scored 121; German, 116. The weather conditions were distinctly unfavorable. However, the cup is a very illusive treasure, and flits about most unexpectedly, as the record of it will show.

The annual financial statement of the New York Athletic Club shows that its trapshooting branch is the only one of the thirteen branches promoted by the club that supported itself and paid a profit. There was a balance of $574.68 to trapshooting credit. All the others showed a deficit ranging from a few hundreds to a few thousands of dollars.

The Manhasset Bay Yacht Club, of Port Washington, L. I., announces its third annual amateur clay target championship, to be held on Jan. 28. Competition is open to members of all clubs on Long Island Sound and the waters thereof, including the Garden City Gun Club, the Hillside Gun Club and the Crescent Athletic Club. Conditions: 100 targets, 16yds., entrance $3. Competition will begin at 11 o'clock. Three handsome trophies will go to the three high guns. Those who wish may engage sleeping rooms the night before the shoot by applying to the House Committee at the club house, Port Washington. Shells may be purchased at the club house. Trains leave New York (Pennsylvania station) 9:05, 10:08, 11:07, 12:05. Trains leave New York (East Thirty-fourth Street Ferry) 8:50, 9:50, 10:50, 11:50. Guns and ammunition shipped in care of the club, by Long Island Express, prepaid, will be delivered at the club house. Entries should be sent to Trap Committee. at the club, Port Washington, L. I., before noon, Friday. Jan. 27, 1911. There also will be a trophy presented to the club whose team of five makes the highest score.

The men making the five best scores for each club will be considered its team. H. L. Hoyt, Jr., is Chairman of the Trapshooting Committee.

BERNARD WATERS.

Wilmington Gun Club.

WILMINGTON, Del., Jan. 14.—A closely contested three-cornered match at 50 targets, between Wm. M. Foord, James T. Skelly and Alden B. Richardson enlivened the competition at the shoot of the Wilmington Gun Club to-day. It was a close, hard contest. Foord and Richardson broke 50 straight, while Skelly broke 46, a 92 per cent. performance. Each man of the tie received a silver spoon for good work done, though there was but one prize at the outset. This contest developed into a challenge by Foord to Richardson to contest for the championship of Delaware, 100 targets per man. This contest will take place some time in the near future.

Richardson, who, during the past two years has been champion of Delaware, shot in great form. He made a run of 113 straight with a strange gun.

The T. Coleman du Pont merchandise event was open to club members only. The contestants were divided into classes.

In Class A, J. A. McKelvey, Henry Winchester and A. B. Richardson tied at 24 out of 25.

In Class B, C. E. Springer, R. A. Vance, E. Ford, R. P. Choate, P. T. Pennington, Stanley Touchton, L. R. Beauchamp and Andrew Dickerson tied at 20 out of 25.

In Class C, R. M. Owens and Dr. Lewis Rumford tied at 16 out of 25.

In Class D, J. R. Baily, W. H. Bacon, Dr. F. Buckmaster and P. V. Ferriday tied at 11 out of 25.

Ties standing over from last Saturday and the Saturday before were shot off as follows:

Dec. 31, tie in Class C, won by S. G. David, 18 out of 25. Tie in Class D won by F. A. Wardenburg, 20 out of 25.

Jan. 7, tie in Class B won by R. P. Choate, 20 out of 25. Tie in Class C won by W. S. Simpson, 15 out of 25.

The trouble experienced last week in the failure of the traps to work was not in evidence to-day. The new trap, which had been promised, was in place and working perfectly, and the two other traps had been put into first-class shape. More improvements are being planned, and will be started early in the week.

The Marlin Firearms Co. watch fob excited much interest, as the conditions governing it were unknown to the shooters. It was won by a total of one out of 25, made by John E. Miller.

The scores made in the merchandise event, out of a possible 25 were:

Bailey	11	Wardenburg	14
Anderson	13	Owens	16
Neeley	12	Farrow	12
Naudain	22	Graw	15
Rutter	7	Choate	20
B F Anderson	6	Lindsey	18
McKelvey	24	Stewart	22
Skelly	23	David	18
McHugh	23	Newman	17

There was an immense gallery, about 1500 spectators witnessing the shooting

New York Athletic Club.

TRAVERS ISLAND, Jan. 14.—Considering the weather conditions, there was a good attendance and good scores. For the January cup, F. H. Schauffler scored a leg with 25 alone, from scratch. This was the only straight scratch score of the day. Dr. De Wolfe and W. B. Ogden tied on 22. There were eleven entrants for the Westley Richards trophy, at 10 pair. Schauffler and Pell tied on 14. The new committee consists of F. H. Schauffler, chairman; G. J. Corbett, secretary; C. W. Billings, G. F. Pelham and T. V. Lenane.

Haslin cup, handicap, 25 targets:

Dr De Wolfe	2	22	G W Kuchler	2	20
W B Ogden	3	22	P Beale	3	20
O C Grinnell	1	21	F H Schauffler	0	18
G F Pell	2	21	G R Schneider	0	18
T Lenane	2	20	A P Walker	0	13

January cup, handicap, 25 targets:

Manhasset Bay Y. C.

PORT WASHINGTON, L. I., Jan. 15.—The regular weekly shoot of the Manhasset Bay Y.C. was held to-day. The weather was wretched and shooting very difficult, owing to a high wind and driving rain.

A great deal of interest is being taken in the championship shoot to be held on Jan. 28. Many entries are expected, and at least five clubs will have their teams on hand. Summary of to-day's shoot:

Ten birds, scratch, sweepstakes:

J W Alker	7	B G Loomis	6
J E Meyer	7	H F Clark	6
H L Hoyt, Jr.	7	C M Gould	3

Fifteen birds, sweepstakes, scratch:

J W Alker	12	B G Loomis	10
H L Hoyt, Jr.	12	H F Clark	9
J E Meyer	11	C M Gould	6

Twenty-five birds, handicap, sweepstakes:

J W Alker	3	24	J E Meyer	3	18
H L Hoyt, Jr.	0	22	H F Clark	2	14
P Russell	3	21	C M Gould	4	13

Monthly cup, handicap:

J E Meyer	3	25	E Unitt	5	20
H F Clark	2	21	B G Loomis	3	19
H L Hoyt, Jr.	0	21	P Russell	3	15
J W Alker	3	21	C M Gould	4	13

Yearly prize, handicap:

H L Hoyt, Jr.	0	20	B G Loomis	3	19
E Unitt	5	20	G W Alkire	3	17
H F Clark	3	19	P Russell	3	17
C M Gould	4	19	J E Meyer	3	15

One hundred birds, scratch:

H L Hoyt, Jr.	82	P Russell	60
J W Alker	71	B G Loomis	64
J E Meyer	65	C M Gould	37
H F Clark	65		

Ten pair doubles:

B G Loomis	14	H F Clark	8
J E Meyer	11	E Unitt	10
H L Hoyt, Jr.	10	P Russell	7
J W Alker	8		

Two-man team race, 25 birds:

Loomis	21	Alker	23
Clark	17—38	Russell	19—42

Twenty-five birds, scratch, sweepstakes:

J W Alkire	20	P. Russell	16
B G Loomis	18	H F Clark	14

Crosby—German.

CHICAGO, Ill., Jan. 14.—The contest for the renowned E. C. cup was shot on the grounds of the Chicago Gun Club, Chicago, Ill., Jan. 14. The weather conditions were unfavorable to high scores. The light was dark, with a raw temperature and heavy clouds. There was a gusty wind betimes. It was far from an average day in respect to weather, so that the contestants, W. R. Crosby, of O'Fallon, Ill., and Lester S. German, of Aberdeen, Md., faced exceptional difficulties.

Both men have excellent records as high class performers at the traps. Crosby has been a professional much longer than has German, and at all times could be depended upon as one who would be among the leaders, if not the leader, at tournaments. German, too, has been one of the phenomenal performers in recent years, with many winning records in the most expert competition, so that this cup contest naturally excited keen interest. This was intensified by the fact that the cup has not been an object of competition in several years, and that one of the conditions—expert rule, one-man up—is a novelty to some of the latter-day shooters.

Crosby's recent illness had no apparent effect on his shooting, as he shot coolly and in good form throughout the contest.

The conditions were: 50 targets, unknown angles; 50 targets, expert rule; 25 pair.

The first 50, unknown angles, resulted in a tie on 44. Thus they were equal on the first third of the distance.

The second 50, expert rule, one man up, resulted in a total of 41 for Crosby to 37 for German. This was the most difficult session of the contest.

At the doubles, Crosby scored 36 to 35 for German.

Prior wins and winners were:

1896.

May 5-8, open competition, Guttenburg, N. Y.—Fred Gilbert.

Aug. 20, Watson's Park, Chicago.—R. O. Heikes defeated Fred Gilbert, 133 to 130.

1897.

July 31, Dayton, O.—Fred Gilbert defeated R. O. Heikes, 142 to 136.

1898.

Aug. 13, Watson's Park, Chicago.—R. O. Heikes defeated Fred Gilbert, 140 to 137.

In October, in an open shoot at Dayton, O., in which the cup was in competition, Heikes won with a total of 273.

1899.

Jan. 21, Philadelphia, Pa.—R. O. Heikes defeated the late E. D. Fulford, 129 to 123.

In May, W. R. Crosby won the cup with a total of 265.

June 24, Batavia, N. Y.—W. R. Crosby defeated J. A. R. Elliott, 128 to 124.

July 24, Batavia, N. Y.—J. A. R. Elliott defeated W. R. Crosby with a total of 136.

August, Atlantic City, N. J.—W. R. Crosby defeated J. A. R. Elliott, 139 to 128.

Oct. 13, Batavia, N. Y.—W. R. Crosby defeated R. O. Heikes, 132 to 130.

Nov. 4, Batavia, N. Y.—Fred Gilbert defeated W. R. Crosby, 120 to 119.

1900.

Feb. 19, Hot Springs, Ark.—Fred Gilbert defeated J. A. R. Elliott, 133 to 124.

Sept. 8, Arnold's Park, Ia.—Fred Gilbert defeated J. A. R. Elliott, 143 to 128.

Oct. 13, Watson's Park, Chicago.—W. R. Crosby defeated Fred Gilbert, 126 to 123.

Sweepstakes were shot in the forenoon and afternoon, the program consisting of five 20-target events. C. M. Powers, of Decatur, Ill., scored 97 out of 100. Jay Graham, Long Lake, Ill., scored 95. Fred Bills, professional, 90.

Afternoon, merchandise events:

The 1910 Official Amateur Averages for Single and Double Targets Won With

WINCHESTER

REPEATING SHOTGUNS.

JAMES S. DAY.

"I used your $27.00 'Pump' all the year 1910. In fact I have never used any other in my shooting experience, which dates from 1903 to the present time. You are aware that I have won many single and double target events and have heralded your gun as being the best and only reliable (thoroughly) repeating shotgun."

JAMES S. DAY.

¶ Such an endorsement from the man who won the Interstate Association's Official Amateur Average for single targets with .9728 per cent. for 4280 targets—a record never equalled by any amateur—means much. It brings shooters face to face with the fact that for strong and even shooting and reliability of action, the Winchester Repeating Shotgun is the gun of guns. Its *list* price is only $27.00, and it retails for less.

¶ The Official Amateur Average for double targets was also won by a Winchester Repeating Shotgun, the winner being Mr. R. A. King, of Delta, Colo., and his record .86 per cent. This showing by amateurs in 1910 is gun glory enough. The moral of it is plain,—

To be in the Spotlight of Victory Shoot a Winchester

J A Taggart	17	16	14	16	16	79

Genesee Gun Club.

ROCHESTER, N. Y., Jan. 12.—The Genesee Gun Club, of Rochester, N. Y., held their first scheduled shoot of 1911 on Jan. 8, when twenty-three shooters faced the trap, from which some 3,000 birds were thrown. Afterward the members and a few friends enjoyed a duck dinner, prepared at the Rifle Range Hotel, at the grounds, by Mr. Magin. All voted the day a success in every respect. We look for a good attendance at our shoots this season. The officers are: F. Kinney, President; M. Ritz, Vice-President; Chas. Messerschmidt, Sec'y; A. Cassal, Treas, and Ed. Albersold, Captain. The scores:

Targets:	10	10	15	20	25	10	25	20	25

CHAS. MESSERSCHMITT, Sec'y.

Amateur Averages, 1910.

PITTSBURG, Pa.—Following herewith is the official Interstate Association list of amateur averages for 1910, with names of contestants, total number of targets shot at in registered tournaments, total number of targets scored and percentages.

The averages for single targets are based on a minimum of 2,000 targets, as per the Interstate Association ruling to that effect. The records of the tournaments held at Weiser, Idaho, May 13-14; Waverly, Minn., May 29-30; Plattsburg, N. Y., June 10; Webster, S. D., June 13, and Moscow, Tenn., July 4-5, were not received, and, of course, are not included in the list.

The averages for double targets are computed on the Interstate Association tournaments only, and they are based on taking part in two tournaments as a minimum, as per the Interstate Association ruling to that effect.

ELMER E. SHANER, Sec'y-Mgr.

Bergen Beach Gun Club.

NEW YORK, Jan. 10.—The Bergen Beach Gun Club will run their spring monthly series of contests on Feb. 13 (Monday), the celebration of Lincoln's Birthday; Tuesday, March 14, and Tuesday, April 11, beginning at 10 A. M. each day. Best total of two out of the three shoots to qualify, three classes, 16 to 19yds., distance handicap; 50 targets each shoot; entrance $1, including birds, for many prizes. Our Saturday shoots, beginning at 1 P. M., will be at 100 targets each day, entrance $1.50, including targets; a trophy or cup each month and other prizes. This Saturday series will run through January, February, March, April, May and June, 1911. Sliding handicap, 16 to 20yds.; five 20-bird events each Saturday. Contestants must enter at least three Saturdays of each month to qualify.

Our fourth Cosmopolitan championship will take place on Thursday, Oct. 12 (Columbus Day), 1911. We do not shoot on Saturdays during July and August. Our total number of shoots during 1910 was 60, and refreshments at the courtesy of the club at each shoot. This total included eleven monthly contests, forty-four Saturdays, four holidays and our "classic," the Cosmopolitan championship. Same this year, boys.

The first regular monthly shoot for the new year was held on Jan. 10, beginning at 1 P. M. In the short afternoon 2850 targets were trapped from the expert club traps. The weather was delightful, the temperature moderating toward the evening. Twenty-one contestants participated, and the averages of those shooting at 100 or more taregts found Mr. Medler in the lead, with Garry Remsen second, Jack Fanning third, Schorty fourth; Vanderveer fifth and Kelly sixth. Garry had Brother Medler skinned on the first 100 by one target, 91 to 90, but the latter batted out a 24 in the next, which hiked his average a few points over Garry's total. Dr. Moeller certainly is a wonder, near three-score-and-ten, and burning nitro powder at 275 targets.

Targets were propelled the full 50yds., as usual, and the right-quarterer was a dipping deceiver.

One of our new members, Mr. S. F. Thompson, tallied but 6 of his 50, but stuck it out nervily to the end. John Dannefelser got a move on in two events, and is improving. Mr. Shannan shot consistently.

Sam Short was referee; Billy De Long scorer, and Fred Schneider, trap-puller.

Our serial contests, beginning on the celebration of Lincoln's Birthday, Feb. 13 (Monday), the other two days being Tuesday, March 14 and Tuesday, April 11, will be corkers. Shooting begins at 10 A. M. on these days, 50 targets; entrance $1, including birds, each day. Total of two of the three scores to count; three classes, 16 to 19yds., distance handicap. Prizes, as usual, and refreshments gratis. All amateurs invited.

Each event was at 25 targets, and all targets were thrown 50yds.:

The FOREST AND STREAM may be obtained from any newsdealer on order. Ask your dealer to supply you regularly.

97.28%

1910 HIGH AMATEUR AVERAGE

Won by MR. J. S. DAY, of Midland, Texas, using

Peters

Factory Loaded Shells

Mr. Day shot at **4280** targets in Registered Tournaments, breaking **4164**, an average of **97.28%**, exceeding by over **2%** the highest official amateur average of any previous year.

During the season Mr. Day made many long runs, among which are the following:

Gorman, Texas, and Walnut Springs, Texas,	Aug.	15-17—	**245** Straight
Walnut Springs, Texas,	"	17-18—	**266** "
Midland, Texas,	"	8-9	**133** "
			121 "
Big Springs, Texas,	"	10-11	**175** "
			152 "
Cisco, Texas, and Gorman, Texas,	"	12-15—	**190** "

PARTICULAR ATTENTION

is directed to the fact that all of Mr. Day's shooting was done with **PETERS REGULAR FACTORY LOADS**, purchased from dealers where the various tournaments were held. His shells were not special in any sense, but were regular stock goods such as can be procured from any **PETERS** dealer.

YOU can get this SUPERIOR AMMUNITION as easily as ordinary loads. You may not always score 97.28% but you will average better than with any other make.

Shoot the shells that have established another World's Record—97.28%—the kind that do not have to be used in any special make of gun to give best results.

ANOTHER Peters VICTORY

This Time a Legal One, and One of Great Importance

We are glad to announce to all our friends the conclusion of the long and hard-fought legal battle between The Peters Cartridge Company and the Winchester Repeating Arms Company. Suit for infringement of Patents was instituted by the Winchester Company in July, 1906; a decision in favor of the Peters Cartridge Company was rendered in the Circuit Court, July, 1909; the case was carried to the United States Circuit Court of Appeals the court of last resort—where on January 11, 1911, the decision of the lower court was affirmed.

It is thus **finally** and **conclusively established** that the shotgun shells manufactured by us are not in any way an infringement of the Winchester Company's goods, but on the contrary, are made according to our own original ideas and scientific tests, by methods and processes which have made **PETERS AMMUNITION** famous for its **SUPERIOR SHOOTING QUALITIES.**

Indianapolis Gun Club.

Indianapolis, Ind., Jan. 7.—The cry of "dead" became a bit monotonous to-day at the initial contest for the president's cup, a valuable and appropriate trophy offered by Dr. Britton, for competition under certain handicap conditions. The real fight was between Lewis, who has of late been shooting well, and consistently, and Moller, for some months out of form. Lewis' first two targets "slipped through the pattern," but he then made a run of 48 and seemed a sure winner. But Moller would not be downed, and broke 49, his "time" being perfect. He followed with 20 straight in practice, Lewis again but one behind, and finished with 69 out of 70.

Next week he competes from the 18yd. mark, all others remaining at 16 until they score a win.

The beauty of the cup appealed strongly to Dixon, wmose modesty—yea, generosity—has long kept him in the background, contented to see his friends line themselves with trophies. It is said Tom Parry had to go to the garret with some of his, but habit again overcame desire, and he was not noticed in the race, although in practice he was high gun.

Practice:

	Shot at.	Broke		Shot at.	Broke
Dixon	60	55	Moller	60	53
Neighbors	60	43	Britton	40	33
Lewis	60	52	Osenbach	40	16

President's cup, 50 targets:

Dixon	42	Britton	38
Neighbors	37	Moller	49
Lewis	48		

Secretary.

Hudson Gun Club.

Jersey City, N. J., Jan. 15.—The first of a series of prize events of the Hudson Gun Club was shot to-day under very favorable conditions, as the day was balmy and spring-like. There were twenty-six shooters who took part in the program events, and some good scores and some that could not be called record-breakers, were recorded. The best performer this morning was an old-timer at our grounds, shooting under the name of Clinton, who finished high gun with an average of 85 per cent., and who made the only straight score of the day, D. D. Engle, with 84 per cent., was a close second, and another old war horse, George Piercy, who was not shooting up to his usual form, had to be content with third average.

In the prize event, Mr. C. Von Lengerke and Mr. A. P. Lane were the lucky shooters to score 6 points each, and win a leg on one of the numerous prizes being contested for. In this contest the management has arranged so that each shooter shooting the series through will win a prize, and we have expensive bronzes, cut-glass, silver vases, loving cups, gold coin, fly-rods, loading implements and lots of other merchandise, that will take the eye of the most fastidious shooter to grace the wall of his den or home.

The second shoot of this series will take place on Jan. 29, and any shooter that knows where the Hudson club house is situated is welcome to get on the job and enter and win one of the trophies.

Targets:	25	25	25	25	25

Secretary.

Analostan Gun Club.

Washington, D. C., Jan. 15.—The Analostan Gun Club held its annual meeting on the 12th inst. The following officers were elected for the ensuing year: President, C. S. Wilson; Vice-President, Dr. W. D. Monroe; Treasurer, Dr. A. B. Stine; Secretary, Miles Taylor; Captain, Col. Geo. W. Peck, Jr.; Trustees, M. D. Hogan, R. P. Hawes and C. B. Wise.

The trustees at the commencement of the season arranged for the club contests. The regulations provided that to be eligible for prizes a member must shoot in at least ten regular shoots, and during the season must shoot at 750 or more targets. The shooters were divided into four classes, which were determined as follows: Class A, from and including the highest percentage obtained by any eligible member to and including 10 per cent. below, and so on down to Class D. The secretary's report showed the following gentlemen to be the winners of the prizes:

Class A:

	Shot at.	Broke.	Per C't.
J A Brown	750	680	.906
Phil Steubener	910	819	.900
C B Wise	775	693	.894
Class B:			
Jas A Drain	1370	1063	.775
Dr A V Parsons	1753	1346	.767
Jas M Green	1645	1130	.686
Class C			
George Talbott	1050	651	.620
J A Moffitt	755	464	.614

During the year Jos. H Hunter made the highest record for all targets shot at, closely followed by Steubener, Wise, Taylor, Brown and Stine.

Jos H Hunter	1470	1360	.925
Philip Steubener	1910	1716	.893
C B Wise	1280	1137	.889
Miles Taylor	1225	1099	.889
J A Brown	1000	973	.884
Dr A B Stine	3255	2822	.863

Perhaps Dr. Stine is entitled to the largest meed of praise for consistent work done in view of the fact that he shot at 3255 targets and scored .868 per cent. of them. He shot in all kinds of weather, and did not miss but one shoot during the season. Hunter made a good record in the club contests, his average being .927, but did not shoot at enough targets to entitle him to a place. Taylor, the secretary, was in the same boat, and had an average in the club contests of .915.

At the meeting the trustees were authorized to install another trap and make other improvements.

It was also decided to join the Maryland Shooting Association, which was recently organized.

During the past year twenty-three new members were added to the rolls. Over 75,000 targets were thrown, and the average attendance at each shoot was twenty members—those actually participating.

In the election of Co. Geo. W. Peck, Jr., as Captain, the club has secured a most excellent officer. He was formerly a member of the Milwaukee and Racine, Wis., gun clubs, and is surely a live wire. He understands the game and there will be something doing every minute under the Colonel's management.

Montclair Gun Club.

Montclair, N. J., Jan. 14.—The heavy fog this afternoon not only deterred several of the would-be shooters from showing up, but produced some very low scores, the best score of the afternoon being made in the fourth event, 21 breaks, by Frazee. The third event—the second leg on the January cup, 25 targets, kickers' handicaps, was won by W. A. Williamson, with 14 breaks and 9 added targets, a total of 23—away below his usual average.

Events:	1	2	3	4
Targets:	15	25	H. 25	25
J C Atwater	14	15	5 22	18
W A Williamson	7	7	9 23	..
Y T Frazee	14	14	4 19	21

E. Winslow, Sec'y.

Marine and Field Club.

Bath Beach, L. I., Jan. 14.—The two events of the Marine and Field Club were shot under unpleasant weather conditions:

Special shoot, 100 targets:

P R Towne	93	C M Camp	82
P G Chase	88	P M Knox	77
J H Emanuel, Jr	87		

Standing in January cup, 200 targets:

J H Emanuel, Jr	170	C M Knox	147
C M Camp	163	P G Chase	88
P R Towne	161	C C Taft	72

Crescent Athletic Club.

BAY RIDGE, L. I., Jan. 14.—The leg on the J. F. Jones trophy was scored by L. C. Hopkins with a score of 25. F. B. Stephenson (scratch) and L. C. Hopkins tied for the Stake trophy, the former winning in the shoot-off. Hopkins scored the leg on the monthly cup, with 25, and on the Lockwood trophy with a like score. Stephenson was high in the doubles with 12 out of 20. Scores:

J. F. James trophies, 25 targets, handicap:

L C Hopkins	5	25	F S Hyatt	1	22

J S Lawson	5	22	J F James	1	18
L C Hopkins	5	21	Dr C Atkinson	5	14

Larchmont Y. C.

LARCHMONT, N. Y., Jan. 15.—There was a fair attendance, though the weather was windy and cloudy. R. L. Spotts and F. E. Samson scored a tie for the Sauer gun on 24, Spotts winning in the shoot-off. Four tied on 23 for the January cup, Spotts shooting from scratch. Wilson won the shoot-off. Samson was high gun for the day with 110 out of 125.

Ten targets, scratch:

F E Samson	10	W D Hinds	5
W J Elias	9	C L Bready	6
R Johnson	9	R L Spotts	9
E A Wilson	9		

Fifteen targets, scratch:

F E Samson	14	W D Hinds	11
W J Elias	10	G L Bready	13
R Johnson	12	R L Spotts	13
E A Wilson	11		

Baudouine cup, 25 targets:

F E Samson	0	21	W D Hinds	2	22
W J Elias	2	18	G L Bready	3	19
R Johnson	1	22	R L Spotts	0	15
E A Wilson	2	19			

Tie between Johnson and Hinds won by Johnson.

Commodore's prize, 25 targets, handicap:

F E Samson	0	21	W D Hinds	2	21
W J Elias	2	19	G L Bready	3	23
R Johnson	0	22	R L Spotts	0	18
E A Wilson	2	23			

Tie between Wilson and Bready won by Bready.

Sauer Gun, 25 targets, handicap:

F E Samson	0	24	W J Elias	2	21
R L Spotts	0	24	R Johnson	0	21
G L Bready	2	21	E A Wilson	2	18
W D Hinds	2	18	A P Walker	0	12

Tie between Samson and Spotts won by Spotts.

January cup, 25 targets, handicap:

E A Wilson	3	23	F E Samson	1	21
W D Hinds	3	23	W J Elias	3	18
G L Bready	3	23	R Johnson	1	18
R L Spotts	0	23	A P Walker	1	14

Tie between Wilson, Hinds, Bready and Spotts won by Wilson.

Ten doubles, scratch:

R L Spotts	13	A P Walker	8
R Johnson	11	E Robins	6
F E Samson	8		

High gun, scratch:

F E Samson	110	G L Bready	94
R L Spotts	102	W D Hinds	91
Johnson	102	W J Elias	86
E A Wilson	94		

125-target handicap:

F E Samson	111	E A Wilson	95
R Johnson	104	W D Hinds	95
G L Bready	102	W J Elias	95
R L Spotts	102		

DU PONT DU PONT

"Amateurs Shoot the Powder They Prefer"

THE OFFICIAL RECORDS

on single targets for 1910 show the following high amateur winners:

1st—J. S. DAY, Midland, Texas 4164 x 4280 — 97.28%
2d—F. S. WRIGHT, South Wales, N.Y. 1977 x 2055 — 96.20%
3d—J. R. GRAHAM, Ingleside, Ill. 5721 x 5970 — 95.82%

Mr. Day shot BALLISTITE and "INFALLIBLE" in making these scores with the exception of one tournament. Eliminating his score at that shoot, his average would be 97.39%.

Messrs. Wright and Graham shot DU PONT Powders exclusively in making the above scores.

History Repeats Itself

"Amateurs Shoot the Powder They Prefer"

A Classic for Sportsmen

AMERICAN BIG GAME IN ITS HAUNTS

Boone and Crockett Club Series

Edited by GEORGE BIRD GRINNELL

An invaluable work not alone for the sportsman, but for the student and lover of wild life. Treats of big game preservation and protection in the broader sense; tells of the habits, habitat and life history of the larger wild animals; touches upon the problem of the public forest domain, and is rounded out by interesting hunting reminiscences by such leaders in the fraternity of big-game hunters as Madison Grant, Paul J. Dashiell, George Bird Grinnell, Jas. H. Kidder and W. Lord Smith. Bound in cloth, library edition, heavy paper, richly illustrated, 497 pages.

Postpaid, $2.50

FOREST AND STREAM PUBLISHING CO., 127 Franklin Street, NEW YORK CITY

Dependable in the long and the difficult shots

The complete burning of the powder develops very high velocity. The shot is not jammed out of shape, but remains round, insuring good patterns and great penetration.

Dead Shot Smokeless

The experienced sportsmen, the expert trapshooters, and the market hunter demand their shells shall be loaded with Dead Shot. The well known feature of this powder, high velocity with light recoil, makes a decided advantage for accuracy

The stability we guarantee.

GOOD GUN OIL

No matter how new or how old your gun, it needs "3 in One." Trigger, shell extractor, hammer, break joints—every action part of any gun works easier, surer, truer, if oiled with "3 in One." It cleans gun barrels inside and out, removes residue of burnt powder, black or smokeless. Positively prevents rust in any climate or weather. Will not gum or dry out. "3 in One" also cleans and polishes stock.

FREE Try this good oil on your gun at our expense. Write for sample bottle and booklet—both free. Library Slip in every package. **3 IN ONE OIL CO., 112 New St., NEW YORK CITY.**

YOU know mallards—wisest and wariest of all ducks—Solomons of the air. You can't knock down mallards with a paddle nor can you get them with a gun that plasters its shots all over the face of creation.

A mallard shot is generally a long shot, and long shots require a hard-shooting, close-shooting gun.

That's why the long-headed man who goes to a mallard country takes a Lefever. When he swings it on a towering pair of mallards he does not question the result. He know it—

TWO CLEAN KILLS

The reason a Lefever kills clean and sure and far is **Lefever Taper Boring.**

But if you buy a Lefever for the taper boring alone, you will get more than your money's worth. For instance, you will never be handicapped with looseness at the hinge joint. The exclusive Lefever screw compensates for a year's wear by a trifling turn that you make yourself with a screwdriver.

LEFEVER SHOT GUNS

Sixteen other exclusive Lefever features and Lefever simplicity and strength make the $28 gun the peer of any $50 gun on the market. Upwards to $1,000. Send for free catalog and get Lefever wise.
LEFEVER ARMS CO., 23 Maltbie St., Syracuse, N.Y.

Event No. 1, $17.50 entrance, was started Wednesday, Jan. 11 (10 birds being shot that day and the balance of 15 on Friday). The value of this Grand Canadian Handicap was $700 guaranteed, and H. Bates, of Ridgetown; S. W. Bilsing, New Brigton, Pa.; George Hassam, Boston, Mass; Thos. Bennett, Toronto, Ont., tied with straight scores. They divided the high money, $90 each, and shot off for honors at miss-and-out. Bates won out at his seventh bird.

The other two events were $8 entrance each, and were shot on Friday, the 13th:

Lock Haven Gun Club.

LOCK HAVEN, Pa., Jan. 16.—The seventh annual meeting of the Lock Haven Gun Club was held Tuesday evening the 8th inst., in the parlors of the New Commercial Hotel. The reports of the various officers and committees showed this hustling and enterprising club to be in a flourishing condition, and the coming tournament, which will be held on the 8th and 9th of August next, promises to eclipse all former efforts on the part of this shooting bunch.

The following officers were elected for the year of 1911: President, Dr. W. J. Shoemaker; Vice-President, R. H. Stewart; Secretary, C. A. Jobson; Treasurer, C. M. Flack; Captain, P. S. Kift; Executive Committee, Hon. C. H. Bressler, C. R. Lauer, O. G. Munro, H. H. Wilson, B. Pardee, H. A. Stevenson, R. W. A. Jamison.

After the meeting seventy-five members and their friends repaired to the spacious dining room and partook of one of Landlord Kyler's famous banquets. The after-dinner speeches showed there would be something doing this summer in the shooting game. Look out for the Lod Home Week and big shoot in August.

Eagle Gun Club.

MANOA, Pa., Jan. 14.—Of the nineteen contestants, five scored straight at the live-bird shoot of the Eagle Gun Club to-day. The leaders were Munson, Felix, Hoffman, Gideon and Wingate. Four tied on 9 for second. Fog and a poor light interfered with quick sighting.

Ten birds, handicap, three moneys:

Munson, 30	2222222222—10	Forsythe, 29	2222001111— 8
Felix, 30	2222222222—10	Letford, 29	2221022110— 8

Rifle Range and Gallery.

Fixtures.

Jan. 30—Feb. 4.—Indoor .22-Caliber League of the U. S., 671 Bushwick avenue, Brooklyn, N. Y. Arthur Hubalek, Sec'y.

March 11-18.—Fifteenth annual championship under auspices of Zettler Rifle Club, 159 W. 23d St., New York.

June 3-4.—St. Louis, Mo.—Second annual combination tournament, Missouri State Rifle Association. C. C. Crossman, Sec'y.

Collegiate Rifle Championship.

WASHINGTON, Jan. 14.—The University of Iowa rifle team made the best score in the first week's contest for the collegiate rifle championship of the United States, according to the results announced to-day. Under the auspices of the National Rifle Association of America, the Intercollegiate Indoor Rifle Shooting League this week began a series of fifteen matches, with sixteen colleges represented. The matches will continue weekly until April 22. The scores of the first week were:

Columbia won from Cornell, 1809 to 1605; Dartmouth won from Minnesota, 1621 to 0, Minnesota having made no report; Princeton won from California, 1413 to 0, California having made no report; Louisiana State won from Arizona, 1462 to 1346; Massachusetts Agricultural College won from Rhode Island State College, 1761 to 1430; Iowa won from Missouri State Military School, 1870 to 1621; Purdue won from New Hampshire College, 1642 to 1353; in the North Georgia Agricultural College match against Washington State College, neither team made reports.

A trophy to the club and silver medals to individual members will be given for the greatest number of victories. A bronze figure has been donated as a special prize by J. A. Baker, Jr., and P. St. G. Bissell, Jr., two members of the Columbia University rifle team, and will be given to the non-military college making the best record in the matches. It will remain in competition for ten years, and become the property of the college winning it the greatest number of times in that period.

The "Old Reliable" PARKER GUN

Wins for the **EIGHTH** Time

The Grand American Handicap

Score of 100 Straight from 19 Yards.

At Chicago, Ill., June 23, 1910.

Mr. Riley Thompson, of Cainsville, Mo., made this record, which has never before been equaled in this classic event.

The **Parker Gun,** in the hands of Mr. Guy V. Dering, also won the Amateur Championship at Chicago, June 24, scoring 189 ex 200, shooting at 160 singles and 20 doubles.

The Prize Winners and Champions shoot **The PARKER GUN!**

Marlin Big Game REPEATING RIFLES *Model 1893*

The Special Smokeless Steel barrel, rifled deep on the Ballard system, creates perfect combustion, develops highest velocity and hurls the bullet with utmost accuracy and mightiest killing impact.

The mechanism is direct-acting, strong, simple and perfectly adjusted. It never clogs. The protecting wall of solid steel between your head and cartridge keeps rain, sleet, snow and all foreign matter from getting into the action. The side ejection throws shells away from line of sight and allows instant repeat shots, always.

Built in perfect proportion throughout, in many high power calibers, it is a quick handling, powerful, accurate gun for all big game.

Every hunter should know all the *Marlin* characteristics. Send for our *free* catalog. Enclose 3 stamps for postage.

THE NARRATIVE OF A SPORTSMAN

INTER-OCEAN HUNTING TALES

EDGAR F. RANDOLPH

A series of hunting reminiscences of rare charm for the sportsman and for the wider circle which delights in true tales of outdoor life. With none of the high coloring and exaggeration which give a false note to so many hunting stories, Mr. Randolph's book is never lacking in interest.

He covers the field of sport with the rifle, east and west, drawing a vivid word picture of life in the open, subordinating his own exploits to the main incidents of outdoor experience, giving much valuable information on camp life, hunting and the habits of wild game, and continually delighting the reader with the freshness of his viewpoint.

This book will strike a sympathetic chord in the memory of every big-game hunter of experience and will prove of real value to the novice who is planning an excursion into the wild.

Cloth, 170 Pages. Richly Illustrated. Postpaid, $1.00.

Rhymes of The Stream and Forest

FRANK MERTON BUCKLAND

One of the freshest, most delightful collections of outdoor verse offered for many a day. They are the outpourings of a spirit which loves nature, the woods and streams and growing things, and appreciates its charms.

Mr. Buckland's verse has a charm that is at once rare and delightful. This book will appeal to every outdoor man or woman, and particularly to the "Brethren of the Angle."

Its form is as attractive as its pages, closely simulating the appearance of the standard fly-book, printed on heavy laid paper with ornamental border designs of trout flies, pocket for clippings, and blank pages for copying or individual composition. It is just the thing for the den, for the pocket, or for a gift to the friend who loves the big world out of doors.

Postpaid, $1.25

The Missouri State Rifle Association has fixed upon June 3 and 4 for its second annual combination tournament, to be held at St. Louis. C. C. Crossman is the Secretary.

WATER POWERS.

Concluded from page 98.

vasion of the Forest Preserve for water storage by these private interests, and so long as they maintain this attitude the monopoly cannot be made complete. The State may itself prevent or destroy a monopoly by developing the water powers which it already fully controls. If the State shall go further and acquire control of all water powers which are naturally a part of the system of waters which it already controls, the people will forever be made free from the menace of a monopoly which, like the coal interests of the present day, could use its powers to extort from the people excessive charges for all future generations.

With very great earnestness, therefore, we urge the enactment of the bills and the adoption of the constitutional amendment, which were recommended to the Legislature in 1910 by the State Water Supply Commission with the approval of Governor Hughes and of the several associations and citizens hereinbefore referred to.

With equal earnestness we urge the defeat in the Legislature of 1911 of the amendment to Article VII., Section 7 of the Constitution which was proposed by Mr. Merritt and approved by the vote of the Legislature of 1910 without a public hearing thereon and without discussion upon the floor of either the Senate or Assembly.

FISHERIES AND FORESTS OF JAPAN.

THE herring catch of Hokkaido is gradually decreasing, and as 40,000 families in the island are engaged, directly or indirectly, in the fisheries, one-half of whom are engaged in the herring fishery, this decrease is a matter of much concern, says Consul-General Sammons, of Yokohama.

One of the reasons given for the decline of the herring catch is the denudation of forests; the removal of trees from large areas results in changing the currents of the rivers, and thus interfering with the propagation of herring. Another reason for the decline is said to be changes in the ocean currents, thus carrying the fish away from the coast of Hokkaido.

While the above reasons are put forward by government officials, there are others concerned in the fishing trade who believe artificial propagation, as practiced on the Pacific Coast of North America, will have to be resorted to in order to retain Hokkaido's percentage of Japan's extensive fisheries business.

OSTRICH FEATHER SHOW IN AFRICA.

THE first ostrich feather show at Middleburg, Cape Province, on Oct. 19, proved a success. The exhibits were magnificent and the entries numerous. The show drew together a large number of feather experts and owners, and it is thought that it will become an annual feature. Professor Duerden delivered a scientific lecture before a large audience on ostrich rearing, illustrated by lantern slides showing ostriches in all stages of development, with kindred birds. —Consul-General Guenther, Cape Town.

CANADIAN LYNX IN MAINE.

THE Canadian lynx has for years been believed to have wholly deserted this section of northern Maine, yet E. H. Kenniston and Everett Hewey, both of Phillips, who have been trapping on Redington Mountain, have recently had experiences with two.

One was caught in a trap and the other attacked Kenniston, and was shot after it had given the trapper a hard fight. Both lynx were very ferocious and both were splendid fighters. —Lewiston Journal.

Nursing vs Dosing.

A Treatise on the Care of Dogs in Health and Disease. By S. T. Hammond ("Shadow"), Author of "Training vs. Breaking." 161 pages. Cloth. Price, $1.00.

Mr. Hammond believes that more dogs are killed by injudicious doctoring than by disease, and the present work is a protest against the too free use of medicine when dogs are sick. The author has given especial attention to many of the troubles which especially afflict small dogs kept in the house, and likely to suffer from lack of exercise and from over-feeding; and boys and girls owning dogs—as well as children of larger growth—may profitably study and ponder this volume.

Contents: Importance of Nursing. Cleanliness. Out-of-Sorts Dam. Puppies. Diet. Other Foods. Kennel and Exercise. Common Ailments. Teething. Diarrhea. Convulsions. Epilepsy. Distemper. Eczema. Need of Proper Care. Sour Stomach. Vermin. Canker of the Ear. Mange. The Nervous System. Abscesses. Colic. Worms.

A Problem's Solution

LOG CABINS & COTTAGES;
How to Build and Furnish Them.

A seasonable book when all minds are bent on the problem of getting close to nature. Mr. Wicks in this delightful book offers timely advice to every one who wants to build a simple summer home at one with its surroundings of wood or stream or shore.

This is a thoroughly practical work, treating of the how, the where, and the with what of camp building and furnishing. It is helpful, too, in regard to furnishing, and withal a most beautiful work.

Cloth, profusely illustrated, $1.50 postpaid.

FOREST AND STREAM PUBLISHING CO.

The Famous Rayo

Gives the Best Light at Any Price

When you pay more than the Rayo price for a lamp, you are paying for extra decorations that cannot add to the quality of the light. You can't pay for a better light, because there is none. An oil light has the least effect on the human eye, and the Rayo Lamp is the best oil lamp made, though low in price. You can pay $5, $10, or $20 for some other lamp, and although you get a more costly lamp, you can't get a better light than the white, mellow, diffused, unflickering light of the low-priced Rayo.

Has a strong, durable shade-holder. This season's burner adds to the strength and appearance. Made of solid brass, nickeled, and easily polished.

PLANNING A HOUSEBOAT

Will be a leisure-hour occupation in many a family this winter. Houseboating has come among us to stay, and promises to be even more popular than in England itself. Every one who is interested in houseboats or who contemplates taking up this feature of outdoor life, should read Mr. Albert Bradlee Hunt's practical, and, at the same time, beautiful work on the houseboat and its adaptation to American waters.

HOUSEBOATS AND HOUSEBOATING

Covers the entire range of its title, considers the use and opportunities of the houseboat; their relation to city and suburban life; construction, furnishing, motive power, and all the thousand and one details, the knowledge of which spells the difference between success and failure in houseboat building and houseboat life.

Details, plans, drawings and specifications illuminate the text, while life on houseboats is interestingly described. Some of the more noted English and American houseboats and the life thereon are also described at length with illustrations. Buckram, heavy paper, sumptuously illustrated.

Postpaid, $3.34

FOREST AND STREAM PUBLISHING CO., 127 Franklin Street, NEW YORK CITY

AMERICAN BIG-GAME HUNTING

BOONE AND CROCKETT CLUB SERIES

Edited by George Bird Grinnell and Theodore Roosevelt

A thoroughly stimulating book dealing with American big-game hunting, East, West and under the Arctic circle, including every phase of sport with the rifle. "American Big-Game Hunting" is a compilation of the experiences of some of the most widely known sportsmen in America. Among the sketches are: The Story of the Buffalo, Capt. Geo. S. Anderson; The White Goat and His Country, Owen Wister; Old Times in the Black Hills, Gen. Roger D. Williams; Coursing the Pronghorn, Theodore Roosevelt; After Wapiti in Wyoming, F. C. Crocker; In Buffalo Days, George Bird Grinnell; Blacktails in the Bad Lands, B. Rumsey.

Forest Preserves and Game Refuges are also considered. Aside from the surpassing interest of the narratives, the book is invaluable for referenc. Cloth, heavy paper, library edition, richly illustrated.

Postpaid, $2.50

A NEW KIND of a TESTIMONIAL

Here's a letter from an old-time gunsmith. Read what he says. It sounds as though he knew what he was talking about. There's a truthful ring to his words—there's a breezy sparkle of satisfaction in every sentence.

"Now to start off, I will frankly admit that I am one of those many gun cranks. I am a gunsmith by trade. I have shot and owned every make of gun shipped in and sold in the South for the past several years. A short time back I purchased one of your No. 520 Pump Shotguns. I bought this gun more through curiosity than anything else, not having the slightest idea of discarding my old gun. I took it to my shop, took it apart to see the mechanism, and the further I went with my investigation, the better it pleased me. I then tried it out in the field thoroughly for pattern, penetration and smoothness of operating. (Now right here I camped.) I want to say that I have never seen its equal. This gun handles with at least from one-third to one-half less friction than any Pump I ever operated. The mechanism is perfect; the finish is the best on any Pump I ever saw. The outlines and balance to my shoulder and eye are more than I ever expected to get in any slide action gun.

"Now, gentlemen, this is something a little out of my line, as it is the first of the kind for me. I am no man to condemn any gun. Give the poorly manufactured guns their just dues, as they will have hard enough time at the best. But I do think when a gun company comes to the shooter with something like you have just put out in this gun, it is time to compliment it—so I just had to pop off. Keep the good work going.

"One more word, please, and I will let you rest. I had in my gun case quite a lot of condemned shells that had been carried and worked through the magazine of other guns until they became so bad that I could not use them in the other guns. I intended giving them to some double-gun man, as I thought they were worthless to me. I run some of them through this gun of yours and could not find one that gave trouble, so I took them out on my last quail shoot and used them with perfect satisfaction and good results. This feature alone is great and has given me lots of trouble heretofore."

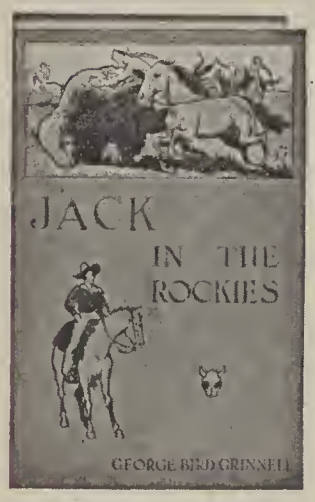
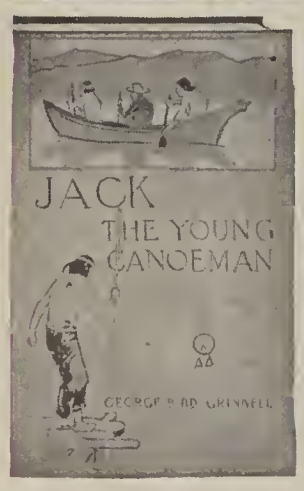
THE JACK SERIES





Best Books For Boys

By GEORGE BIRD GRINNELL

THE solution of the parents' problem of providing for the growing boy reading at once healthy and satisfying to his craving for action and adventure. In the Jack Books the longing of the normal boy for Western stories is gratified, the interest is absorbed and the mind is unconsciously led to phases of life that are elevating and instructive.

The books are the story of a young New York lad, sent to Stillwater ranch in the Rockies for his health, who becomes the companion of a veteran of the frontier. For each of six succeeding years he is led through new territory and experiences, accumulating much of the lore of plain and mountain, enriched with tales of the old West.

Ranch life, travel and hunting on the lonely plains, Indian camps, mountain climbing, trapping and canoeing are described. There is not a dull page, and the author manages to put much of the spirit of the West into his books. Jack is a real boy, and the books are stories for live boys—not lectures in disguise.

American Game Bird Shooting

By George Bird Grinnell

This new book covers the whole field of upland shooting in America as this field has never before been covered, and is intensely interesting and useful to everyone who uses the shotgun. It deals with the birds followed with dog and gun by the upland shooter, and describes the habits of the woodcock, snipe, all the North American quail, all the grouse and the wild turkeys.

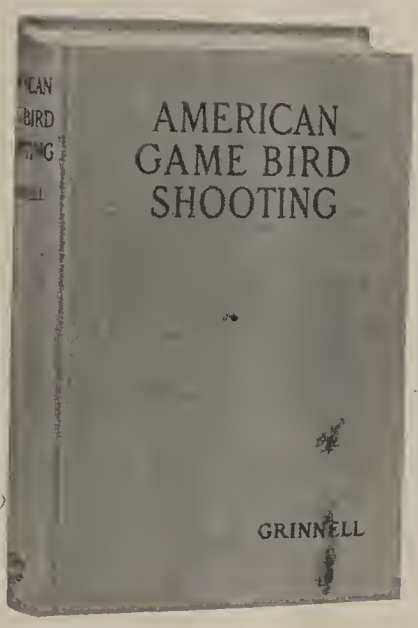
The completion of this book was a large task, requiring exceptional qualifications, knowledge and experience, and was never before accomplished by any other author.

It is the companion volume to Mr. Grinnell's book, "American Duck Shooting." Thus the two books cover the entire field of game birds taken with the shotgun, with complete description of their natural history features.

"A very complete monograph for sportsmen and naturalists....with anecdotes, of his own and others....the book will be enjoyed not only by sportsmen but by the general reader."
—The Sun, New York.

"An important, thoroughly reliable and well written book; a work that will be read with interest and pleasure by sportsmen. The work is the first complete one of its kind."
—The Boston Globe.

"No book as good as this on the subject treated, nor so fully covering the field, has been produced." **—The Salt Lake Tribune.**



"This volume is especially welcome—a treat to every man who loves to tramp the uplands with dog and gun." **—Inter-Ocean, Chicago.**

"Each bird is taken up in turn, the best methods to hunt, the selection of guns and loads, clothing and dogs are set forth simply and fully."
—Baltimore American.

"It is, I think, a model of what such a book should be—but so seldom is. It is, indeed, much more than a treatise on field sports, for it furnishes such full and excellent life histories of the birds of which it treats that it should find a place in every library devoted to pure ornithology."
—William Brewster, Cambridge, Mass.

PART I. Describes in detail the ways of life of all the American Game Birds; woodcock, snipe, bobwhite, mountain quail, California quail, Gambel's quail, scaled quail and Mearn's quail; dusky grouse, Franklin's grouse, Canada grouse, ruffed grouse, all the ptarmigan, pinnated grouse, sharp tail grouse and sage grouse, and the wild turkeys.

PART II. Is devoted to upland shooting. Here are described at length and in detail all the various methods of taking all the birds mentioned above, and the various aids to shooting, such as guns and loads, dogs and clothing.

PART III. Deals with the shooting of the past and future; tells of the efforts to introduce foreign and native game birds to restock our covers, and of the successful attempts by Dr. Clinton F. Hodge to rear in captivity the ruffed grouse and bobwhite.

The volume is handsomely illustrated. There are colored plates of the ruffed grouse and the quail, made by America's greatest bird painter, Louis Agassiz Fuertes, and 48 other full page plates, most of them photographs from life, showing portraits of different species of birds and interesting shooting scenes. In the text are a number of useful and interesting line cuts. Everyone who delights in the outdoor life and rejoices in tramping the field and woods with dog and gun should possess this handsome volume, which speaks the final word on upland shooting, as its predecessor in this field did on wildfowl shooting.

Cloth. About 575 pages. Price $3.50 net. Postage 25 cents.

MY SIXTY YEARS ON THE PLAINS, TRAPPING, TRADING AND INDIAN FIGHTING.

W. T. (Bill) Hamilton. The author was the last survivor of the old race of free trappers. Bill Hamilton was born in 1825, and was on the plains in 1842, trapper, Indian fighter, sign talker, trader, scout and guide so long as the old West survived. This book is the simple unaffected story of his adventurous life, more thrilling and full of personal interest than any romance. Cloth. Illustrated, 223 pages. Postpaid, $1.50.

NURSING VS. DOSING.

S. T. Hammond. A most practical book for the dog fancier, based largely on Mr. Hammond's observation that dogs, and particularly house dogs, suffer from too much medicine. Contents: Nursing, Cleanliness, Diet, Other Foods, Kennel and Exercise, Common Ailments, Diarrhea, Convulsions, Epilepsy, Distemper, Eczema, Need of Proper Care, Stomach, Vermin, Earl, Mange, Nervous System, Colic, Worms. Cloth. Illustrated, 161 pages. Postpaid, $1.00.

RHYMES OF THE STREAM AND FOREST.

Frank Merton Buckland. A charming collection of verse by an author who knows and loves nature well. A particularly pleasing gift for fishermen, closely simulating in form and ornamentation the standard fly-book. Cloth. Heavy laid paper. Sumptuously bound. Postpaid, $1.25.

THE STILL-HUNTER.

Theo. S. Van Dyke. A practical Treatise on Deer-Stalking. Extra cloth, beveled, 350 pages. Price, $1.75.

LOG CABINS AND COTTAGES.

William S. Wicks. This book covers building for the woods from the simplest shelter to the most elaborate cottage, cabin or house, and their furnishing and fitting. The details and directions are at once simple and comprehensive, and the illustrations are numerous and illuminative. Cloth. Illustrated, 44 full page plates and numerous text illustrations. Postpaid, $1.50.

THE ANGLER'S WORKSHOP. ROD MAKING FOR BEGINNERS.

Perry D. Frazer. A complete, simple and thoroughly up-to-date work for the guidance of the amateur rod maker, carrying him from first principles through all phases of successful rod making. There is no theorizing or speculation. All terms are simple, and all kinds of rods and woods are treated of. Cloth, 180 pages. Four full-page illustrations, 60 working drawings. Postpaid, $1.

THE BOOK OF THE BLACK BASS.

James A. Henshall. The standard work on the black bass, comprising a complete scientific and life history of the black bass, together with a practical treatise on angling and fly-fishing, a full description of tackle and implements, and general observations. Cloth. Illustrated. 470 pages. Postpaid, $3.00.

MEN I HAVE FISHED WITH.

Fred Mather. Sketches of character and incident with rod and gun from childhood to manhood; from the killing of little fishes and birds to a buffalo hunt. Illustrated. Price, $2.00

MY ANGLING FRIENDS.

Fred Mather. A Second Series of "Men I Have Fished With." Cloth, 369 pages, with 13 illustrations. Price. $2.

TRAINING VS. BREAKING.

Practical Dog Training; or, Training vs. Breaking. By S. T. Hammond. To which is added a chapter on training pet dogs, by an amateur. Cloth, 165 pages. Price, $1.00.

HOW TO BUILD A SKIPJACK.

Complete plans and instructions for building a light draft sloop. Plans and directions easily followed. Cloth. Illustrated. Postpaid, $1.00.

HOW TO BUILD A KNOCKABOUT.

A wholesome boat for all-around cruising and racing; 32ft. O. W., 10ft. beam, 26in. draft. Full working plans and drawings, with instructions for building. Cloth. Illustrated. Postpaid, $1.00.

Life and Sport in Labrador

NAPOLEON A. COMEAU.

In "Life and Sport on the North Shore of the Lower St. Lawrence and Gulf," Mr. Comeau has made a valuable addition to the literature of rod and rifle—and more. It is a book of engrossing personal interest to the sportsman or general reader, and of rare value to the student of wild life.

The author describes the events and experiences of fifty years, spent in the cause of humanity and science in one of the most interesting and least known sections of Canada. He writes as one sportsman to his fellows, detailing his experiences with the wild things of wood, shore and sea, with plenty of stirring experiences with big game and gamy fish.

Illustrated, 450 pages. Paper. Postpaid, $2.50.

FOREST AND STREAM PUBLISHING CO.

GRAZING ON THE NATIONAL FORESTS

THE authority of the Secretary of Agriculture to prevent the grazing of livestock on the National Forests without a permit has been sustained in New Mexico by action of the Federal courts in three cases in which the defendants had caused or permitted stock to trespass upon the Alamo Forest in defiance of the regulations.

Because of the belief which has been current among stockmen of some localities during the last year that the regulations of the Secretary of Agriculture with regard to grazing on the National Forests are unenforceable, the New Mexico cases are regarded by officials of the Department of Agriculture as particularly timely and valuable. The recent disposition to question the validity of the regulations has evidently been due to the entirely natural desire of the stockmen to assert what they supposed, though mistakenly, to be their rights under the law as interpreted by the courts. Secretary Wilson considers that the effect of the action taken in the New Mexico cases will be to clarify the situation materially, and to promote a better understanding of the legal rights of the department.

The misconception which has led stockmen to suppose they might graze their stock on the National Forests without taking out a permit and paying the grazing fee was due to the decision rendered by the Supreme Court of the United States last March, affirming a decision of the United States district court for the southern district of California, by Judge Wellborn, that violation of the grazing regulations is not punishable as a crime. This decision of the Supreme Court, however, was by an even division of the Justices, and therefore did not decide the general question one way or the other, but merely affirmed the decision of the lower court in the particular case. The Supreme Court has granted a rehearing of the case, in order that the question may be passed upon by a full bench and authoritatively settled, and this rehearing will soon take place. But the authority of the secretary to prevent grazing except in accordance with his regulations does not, it is pointed out, depend upon affirmation of the power of the Government to punish violation of the regulations as a crime. This is made clear by the action in two of the New Mexico cases; while the third case illustrated the fact that the affirmation of Judge Wellborn's decision by the Supreme Court has no binding force in cases other than the particular one then before the court.

In the cases of Sam Cope and S. O. Cope, defendants, and of G. W. Jernigam, defendant, injunctions were granted by the Federal district court to prevent the continued grazing of stock owned by the defendants upon the National Forests. The ground upon which these injunctions were granted was not the power of the Government to punish violators of the regulations through criminal procedure, but was the right of the Government to bring action against the owners of stock which trespass upon the property of the Government. In the Cope case punitive damages were imposed by the court for wilful trespass, in addition to an award of $75 for actual damages sustained. The amount of the actual damage was determined by the finding of the court that the value of the grazing privilege in the Alamo National Forest was $1.50 per year for each head of cattle or horses.

This case is the more decisive as to the authority of the secretary to enforce the grazing regulations from the fact that an attempt to proceed against the defendants criminally had failed because of the refusal of the grand jury to bring an indictment against them. In the third of the New Mexico cases, however, such an indictment was found by the grand jury against J. W. Van Winkle, for having grazed 1,000 head of goats upon the Alamo National Forest without a permit. As a result of this indictment Van Winkle was arrested at Alamogordo by a deputy United States marshal, and bound over for appearance at the April term of the Federal court.

By A. L. A. Himmelwright, President U. S. Revolver Association, Director New York State Rifle Association.

A handy pocket-size volume of 157 pages of practical information, covering the entire subject of Pistol and Revolver Shooting. This work is strictly up-to-date, including the latest development in smokeless powder; the 1908 Revolver Regulations and Practice of the United States Army, the United States Navy, and the National Guard; the Annual Championship matches and Revised Rules and Regulations of the United States Revolver Association, etc. Besides being a useful, practical handbook for the experienced marksman, the work will also prove particularly valuable for beginners.

Contents: Historical: Arms—Military, Target, Pocket Ammunition; Sights; Position; Target Shooting; Revolver Practice for the Police; Pistol Shooting for Ladies; Clubs and Ranges; Hints to Beginners; Selection of Arms; Manipulation; Position and Aiming; Target Practice; Cleaning and Care of Arms; Reloading Ammunition—primers, shells, bullets, powders, reloading. Appendix—Annual Championship Matches of the U. S. Revolver Association; Rules Governing Matches, etc. Records of the U. S. Revolver Association.

In three styles: Paper, 60 cents. Cloth, $1.00. Full morocco, $1.50. A liberal discount to military organizations and shooting clubs on orders of ten or more copies.

KENNEL LEDGER

Complete, Compact, Pocket Size.

Specially arranged according to the directions of an experienced kennel manager. Full printed headings for receipts, experience, data, etc. Ruled pages. Memoranda spaces. The most complete and handy small kennel record yet devised. Smooth, heavy paper, 100 pages, 6½×4. Cloth covers.

Postpaid, 80 cents.

FOREST AND STREAM PUBLISHING CO.

HITTING vs. MISSING.

By S. T. Hammond ("Shadow"). Cloth. Price, $1.00.

Mr. Hammond enjoys among his field companions the repute of being an unusually good shot, and one who is particularly successful in that most difficult branch of upland shooting, the pursuit of the ruffed grouse, or partridge. This prompted the suggestion that he should write down for others an exposition of the methods by which his skill was acquired. The result is this original manual of "Hitting vs. Missing." We term it original, because, as the chapters will show, the author was self-taught; the expedients and devices adopted and the forms of practice followed were his own. This then may be termed the Hammond of system of shooting; and as it was successful in his own experience, being here set forth simply and intelligently, it will prove not less effective with others.

The Angler's Workshop

RODMAKING FOR BEGINNERS

By PERRY D. FRAZER

A unique work, bringing the science of rodmaking up to the very moment and epitomizing the knowledge and the experience of experts for the guidance of the average man. The evolution of bait-casting principles has made Mr. Frazer's book supersede all previous publications on the subject.

Every angler—young or old—who is fond of adapting his rods and tackle to his own ideas of what they should be, will find in this book a large fund of information gathered by the author in years of study, experiment and practical expericnce in fishing, tournament casting and at the work bench. He theorizes and speculates not at all. He tells "the how" of everything connected with rodmaking in a way that makes results certain. All explanations are simple and easily followed.

Separate chapters are devoted to each of a half dozen types of bait-casting rods; to tarpon, surf and light salt water rods; bass and trout, salmon and tournament fly-rods. Complete specifications of well known types are given, and the chapter on split bamboo rodmaking is the most comprehensive treatise on the subject ever published. Indispensable in the angler's library.

Cloth, 180 pages, four full-page illustrations, 60 working drawings, making plain every feature of the text. Postpaid, $1.

The Game Book

STANDARD BIG GAME MEASUREMENTS

Every man wants to compare his trophy with those of other big-game hunters. But comparisons are useless unless there is a fixed standard.

The game book of the Boone and Crockett Club, the foremost organization of hunters of American big-game supplies this. Compiled by J. H. Kidder, it provides directions for standard measurements of the large game animals of America, with spaces carefully arranged for complete data regarding the kill, locality, time, conditions, etc.

It is handsomely and durably bound pocket size. It is an invaluable record for every man who goes into the wild for sport with the rifle, a handy book, a camp companion, and a library reminder of days afield. Leather.

Postpaid, $1.50

Where, When and How to Catch Fish on the East Coast of Florida

By Wm. H. Gregg, of St. Louis, Mo., assisted by Capt. John Gardner, of Ponce Park, Mosquito Inlet, Fla. With 100 engravings and 12 colored illustrations. Cloth. Illustrated. 238 pages. Map. Price, $4.00.

A visitor to Florida can hardly make the trip without this book, if he is at all interested in angling. It gives a very complete list of the fishes of the East Coast of Florida, and every species is illustrated by a cut taken from the best authorities. The cuts are thus of the most value to the angler who desires to identify the fish he takes, while the colored plates of the tropical fish shown in all their wonderful gorgeousness of coloring, are very beautiful. Besides the pictures of fish, there are cuts showing portions of the fishing tackle, which the author uses. A good index completes the volume.

PREPARING FOR A BATTLE.

OFFICIALS of the National Association of Audubon Societies express the belief that during the year just opening great efforts are to be made by commercial interests to break down the various game and bird protective laws which have so slowly and painfully been built up in many of the States. Movements are reported to be on foot to repeal laws prohibiting spring shooting in several States, while the feather dealers, representing millions of capital, are to strive to have the laws against the use of bird plumage by women repealed. So the Audubon Societies and all other protective clubs call upon bird lovers, farmers and sportsmen to join forces against feather dealers and market shooters to protect the insect eating birds and game birds that work for the farmer and that are so well beloved by the sportsmen.

Already in New York State one or more bills have been introduced to open the spring to the shooting of wildfowl. Many game dealers declare that the public demands spring ducks, and quite forgetful of the increase of the wildfowl brought about within two or three years by the stopping of spring shooting, wish to extend the shooting season on Long Island until the migrating birds have all departed for the North.

In Connecticut the shore shooters purpose to strive to have spring shooting reopened, declaring that the coots and old squaws can be most effectively killed in spring—which of course is very true. They do not regard the fact that within the past two or three years black ducks have bred in Connecticut where they never before bred within the memory of living man, and that the black duck shooting in the fall has been better there than for many years.

In Massachusetts efforts are to be made to repeal laws restricting the storage and sale of game and to permit the shooting of ducks wherever they are found.

Last year New York State enacted a law forbidding the use of aigrettes and the sale of these ornaments has been hurried by the millinery trade in order to get rid of their stock. Yet it is said that an effort is to be made to repeal that law, and the feather dealers are reported to be prepared to spend great sums of money to accomplish this end.

In preparation for the expected battle the National Association of Audubon Societies is gathering ammunition to prevent the repeal of this wholesome legislation. It seeks the aid of farmers, sportsmen, orchardists and ranchmen of the whole country. It is prepared to furnish evidence to everyone of the good the birds do and calls earnestly for help from that wide public who have no special interests to serve but only consider the good of the whole country.

TWO NEW ANTELOPE HERDS.

ON a number of occasions since the establishment of the Wichita Game Preserve and the Buffalo Preserve in Montana, we have pointed out the importance of introducing a herd of antelope on each of these fenced preserves. This species, unique in all the world, is especially deserving of preservation. Its numbers in North America are constantly growing smaller, and while most of the States and Provinces protect it by law, the area which it can inhabit is ever contracting, and the antelope are constantly decreasing. It is, therefore, of especial importance that new herds should be established at different points where they will be adequately protected.

It is gratifying to learn that the Boone and Crockett Club, under authorization of the Secretary of the Interior and with the help of Major Brett, the acting Superintendent of the Yellowstone Park, has caused to be trapped on the winter range of the antelope near Gardiner, Mont., twenty-three animals, of which twelve were sent to the buffalo park in Montana and eleven to the game preserve in Oklahoma. Of the twenty-three animals so captured, four were lost, killing themselves in the crates in which they were shipped, but there are believed to be nine antelope on the Oklahoma preserve and ten on that in Montana which are practically uninjured. Each of these groups should be the foundation of a large herd in coming years.

This matter was initiated and the expenses connected with it paid for by the Boone and Crockett Club, to which great credit must be given for performing so good a work. It is very encouraging to find private associations willing to make such contributions to the public welfare as have been made by the New York Zoological Society and the Bison Society, which stocked with buffalo the Wichita Game Preserve and the Montana Buffalo Preserve, and now by the Boone and Crockett Club, which has presented to each of these preserves a herd of antelope.

HARRY I. GRIFFITH has been appointed superintendent of the Bellefonte hatchery in Pennsylvania. He succeeds Howard M. Buller, whose death occurred recently.

BONDED WILDFOWL.

THE New York Association for the Protection of Game has brought suit against the Conron Bros. Co., of New York city, alleging the possession of wildfowl in the close season. The defendant company, in its answer, claimed that the wildfowl were held legally, according to Section 241 of the forest, fish and game law.

This section, the association maintains, is unconstitutional, as being class legislation, giving to dealers a special privilege denied other persons in the State. It is pointed out that wildfowl shot in another State may be brought into New York State for sale, under bond, until March 1, the last day for possession under bond in this State of such game; then placed in cold storage until the opening of the ensuing shooting season, on Sept. 16.

Under ordinary circumstances Judge Blanchard's opinion may not be expected until some time next month, and if the association's claims are affirmed, the wildfowl now being legally shot in other States and legally stored here, as may now be done, cannot be disposed of legally.

THE Pennsylvania Legislature will this winter be again asked to pass a law providing that residents of that State who wish to hunt game must provide themselves with a license. The game commission has issued a brief setting forth its reasons for advocating the passage of this measure, and the State Sportsmen's Association has indorsed the plan. Already the State has a law which prohibits aliens from shooting or carrying guns, and requiring a non-resident shooting license, but so far all attempts to oblige residents to pay a fee to shoot have failed. The commission, in its brief, says among other things that unless better measures are taken to preserve the game, the man of moderate means will within a short time be compelled to hang his gun upon its hooks forever. A resident license fee fund will, it is claimed, be the means of averting this otherwise inevitable condition. At one dollar it is estimated the fund would total $150,000 per annum. It is believed that better protection of the game will be possible if the law is passed.

WHILE the Long Island gunners are just as persistent this year as last in their efforts to secure a longer season for wildfowling, they have modified their demands slightly. They profess to be content with a proposition to make the open season for ducks, geese, brant and swan just a half-year long, closing on all fools' day, and with possession until mid-April. This is not in strict accord with the baymen's demands, made at a meeting last month. At that time they seemed to think March 1 should mark the close of the season, and that gunners should take up their batteries at sunset, as the law now provides.

Winter Camp-Fires

II.—An Exhausting Climb—Down the Steep Mountain After Dark—Pascal's Accident

By W. J. BIGNELL

PASCAL and I had decided that on the following day we would break a trail to the summit of the mountain. Then we would reconnoiter, secure a caribou if possible, and at the close of the day return to the shack. After this experiment we could decide whether it was feasible for us to climb the mountain each day, or whether, in order to secure time for hunting, we would have to tent nearer the summit at a point where there had formerly been an Indian tepee. So early the next morning we were on our way up, following the old Indian blazes. There was nothing of what might be termed mountaineering about our manner of ascent. It was simply a long, hard, direct climb of about four hours, the last stage of the climb being so precipitous that we covered much more than the actual distance represented by the stretch, for we were continually slipping and sliding back and crawling up again. Not infrequently a single slide measured as much as fifteen feet. Had we not been equipped with the round Montagnais snowshoes, the tussle would have been still harder. The long climb came to an end at last, and we finally emerged on the summit or barrens.

The slightly hilly character of the tract we had struck interfered with an extensive outlook, but after proceeding a short distance we obtained a wider range, and at a point perhaps 300 yards away I noticed something that had the appearance of antlers growing out of the ground. I called Pascal's attention to this and we proceeded cautiously to investigate. Suddenly the antlers came to life, and we discovered that they were attached to a caribou that had been lying down. He had not fully scented us, yet an indefinite something had warned him of danger and made him uneasy, and he started slowly off while we crept after him in the open, or got up and ran whenever a knob or a boulder afforded sufficient cover. Before we could get within decent range we reached a little knoll where nearly the whole expanse of the barren opened to view, and I shall never forget the sight. Six or eight square miles were probably represented by this open space, and there were caribou everywhere. They were by twos, by fives or again in bands comprising from ten to twenty each. The entire company must have numbered near 200. We were spellbound at the sight; we forgot the time of day, the distance to camp, forgot prudence—forgot everything but those caribou.

Pascal had never before seen so many together, and I had never seen more than five together. We must have watched them for over

THE RUGGED, PRECIPITOUS SHICKSHOCK MOUNTAINS.

half an hour. Some were lying down and others standing. Some were in restless movement and others were pawing away the snow and eating the moss. Once in a while one of them would play about, frisking like a lamb.

It was a beautiful, sunny, mild day with a gentle breeze, but blowing unfortunately somewhat from our side of the barren toward the caribou, the nearest of which were perhaps 400 yards away, and the furthest so far that we merely saw their moving dots of bodies, apparently without legs, standing out against the skyline. The atmosphere was so clear that it was as if one looked through a telescope, bringing all objects near.

We suddenly awoke to the fact that the day was advancing, and looking at our watches found they registered 1 o'clock. Owing to the lateness of the hour it was impossible to skirt the caribou and get them up wind, as in order to do this a detour of several miles would have been necessary. I could not make out any fine antlers among the nearest, or I would have tried a few long range shots.

Under the circumstances the proper thing for us to do was to return to camp for the night, portage our tent to near the summit, and from that point of vantage get back to the hunting another day, but I simply could not leave those caribou when I thought of the heads there must be among them.

It was liable to storm. Caribou are uncertain as to their movements; I was afraid they might take to the woods and disappear for several days, and the open season was nearly over.

Pascal, always agreeably ready for everything, made no objection when I proposed trying to approach the caribou more or less down wind, and taking the chance of getting in range. Picking the nearest band of any size we began to creep toward them. We had only advanced a few hundred feet when the wind evidently brought them some subtle knowledge of us, for they commenced the same restless moving tactics that the lone caribou had employed before. After several attempts to approach other bands, but always with the same result, we gave it up, and I decided to have a try at what looked like a very fine head some 400 yards away.

I tried him high and I tried him low, but could not get the range and could not see where my bullets were striking, though I think I touched him once, for he humped his back in a peculiar manner. I fired six shots at him and then gave it up, as he was wandering further away all the time. Pascal was much disgusted with my shotiong, but was kind enough to add that whether it was the rare atmosphere or the glare that affected the vision, he had never known anyone to shoot very straight at any distance on these barrens. I had the hope of better luck as soon as we pitched the tent near the summit and could devote the whole day to hunting.

By this time it was imperative for us to start back. We were over two miles from the point where we had struck the barrens and Pascal said that near by in the beginning of the scrub timber on the mountain side there was a little lake whose brook outlet runs into the river on which our shack stood. He said it was longer down by the brook way, but far less steep than the way by which we had come. We would strike the river at a point about three miles distant from our shack. But he thought we

could reach the river before nightfall, and the rest of the way mattered very little, as even at night there would be light enough to enable us to follow our river tracks of the day before.

We started, but had not reached the edge of the barren before the unexpected happened. Right in front of us and coming toward us down wind appeared two caribou. We threw ourselves to the ground and waited. They came on unsuspectingly straight toward us. One of them had nice antlers and the other was a spike horn. I wanted the one with the antlers and paid no attention to the other. At about seventy-five yards away the larger animal stopped. One shot tumbled him over, a second stopped his kicking, and we got up and started for the prostrate caribou. The unwounded beast was examining his mate with much interest, and strange to say when we rose he appeared equally interested in us. Not till we were within fifty feet or so did he catch our scent, and then with a loud whouff he was off like a shot. I have never attribute the trouble to me, though he saw me perfectly because I got up and walked toward him. He just kept about the same distance away, trotting off and then turning around and facing me again in an endeavor I should say to determine what sort of an animal I was. He was such a fool that I did not have the heart to kill him. It must be borne in mind that the foregoing experiences took place on barren ground. When once a caribou gets into the woods, it is hard enough to approach him.

Pascal and I determined that whatever happened we would carry a load down with us. I wanted to get the head mounted, but had no time to do more than chop it off at the neck, leaving a sufficient amount of the hide. Pascal strapped this securely to my back. He then took the two hind quarters, rolled them in the rest of the hide and made a sack of it, looping the hind leg parts so as to pass over his shoulders and under his arms as straps, and fastening the ends to the hide with nails as pins, a of the brook. When he was extricated I found he was badly wrenched by the sack he was carrying, and one of his feet had gone into a water hole, wetting it thoroughly.

I suggested leaving our packs here to be collected another day, and making a fire to dry his socks as soon as we could find dry wood and birch bark, but he was in an ugly, determined mood after his tumble, and said his sack was going to the river if it took till morning, so I determined to hang on to mine. It was not very cold and I am sure he did not imagine his foot was in any danger of freezing; in fact, he admitted this later.

The brook being too dangerous, we now took to the woods, and here my troubles began. Pascal was piloting and I followed blindly. It was so dark that sometimes I could not see him at all, and occasionally had to guide myself by feeling for the depressions his snowshoes made. The antlers were continually catching in branches and trees and must have thrown me to the

THE WIND-SWEPT BARRENS OF THE SHICKSHOCK RANGE.
Photograph by a friend of Mr. Bignell's.

seen anything more foolish in a wild animal than the manner in which that caribou stood looking with the greatest curiosity, first at his friend on the ground and then at us.

In this connection I may say that when caribou are in the open and catch no human scent, some of them exhibit as much curiosity as do sheep. By bobbing up and down behind a rock I have sometimes caused caribou to approach, making large half circles as they advanced with the evident wish to get the scent of the unknown object. This applies to occasional individuals only, for the exercise of the same tactics will cause others to make off at once. The latter I suppose have already been hunted, or they are perhaps wise old fellows of a naturally cautious disposition. The only effect which the report of a rifle produces on them is to lead them to look in all directions, with ears alert, as if to see what has caused the sound. The wounding or killing of one out of an assembled company seems to arouse no sentiment save curiosity among the others, and a hunter could pot an entire band—one after the other—provided he kept out of smell and sight. Indeed, as I have already shown, there are instances when to keep out of smell is all that is necessary. I have wounded a caribou to the extent of making him limp visibly, and still he did not appear to heavy load even for a man of his remarkable capacity. It was now 4 o'clock and we started off with all speed. We found Pascal's little lake and its tiny outlet, which, however, soon widened into a respectable brook owing to its augmentation by other sources.

It was mostly good going on the frozen brook, though from time to time we had to leave it owing to bad or open places. It was a race between us and nightfall, and some time before we got clear of the mountain and into the river flats we began to see that nightfall would win easily. It began to get darker and darker under the trees, and by the time we were a mile from the river, we could no longer distinguish the bad places on the brook, and thus misfortune overtook Pascal.

If you have ever tried walking over the snow in the dark, you will know that no matter what the formation of the territory in front of you, everything looks white and level, so that you may suddenly step off a fifteen-foot embankment where you were certain your foot was going on solid ground. This is what happened to Pascal. He was walking in front when suddenly his shadowy form disappeared from my view altogether, and I heard much forcible and descriptive language from quite a distance below me. He had walked off an embankment at the edge ground twenty to thirty times in addition to the other falls I got during that last mile or so from not being able to distinguish objects and fallen trees in the road. I would gladly have changed my antlers for the heavier sack, or thrown them away, but I was younger then than I am now and would not give in as long as Pascal hung to his own load.

When we got into some second growth stuff of tangled balsam, however, I reached the point of exhaustion from the various falls, wrenches and whacks which I continually had to endure, and hunger was making things worse. Finally my brain started to play me funny tricks. Dark forms began to move about in the woods, and when I fell down I took more interest in the affair as an onlooker than as an actual participant.

It was the end of January and the days were getting comparatively long. We had started at day break, done a four hours' heavy climb, had been running, crawling or working all day with the exception of the time we had watched the caribou, had eaten only one ship biscuit each and had finally made this last dash for the river, a dash which represented several hours of struggle and which ended in darkness and for me in everlasting entanglement with the antlers.

Wrenching, pulling, falling, getting up again,

battered and bruised, I can only recall toward the last a sort of nightmare of progress. We reached the river something over two hours after Pascal had fallen, having probably made double the necessary distance. Pascal had no compass and went, I think, by his sense of smell.

Pascal now informed me that he thought the toes of his wet foot were frost bitten, but that he preferred to get to camp and treat them there rather than to attempt it in the open. Besides he did not think they would get any worse than they were while covering the short distance that remained.

He was now ready to leave his sack, as this spot was on the road home, and it would have been useless to pack the things further. After cutting off some steak we hung the rest of the things in a tree and started on the last three miles. A feeble moon was showing and after the darkness of the woods the faint illumination appeared to us like a glorious light.

Being rid of my incubus, and having had a refreshing drink of water and a short rest, I found myself considerably revived. The remaining three miles did not seem so very long and I think I could have kept on walking much further in the open, as my legs had taken on a sort of automatic action, and comparing notes with Pascal I found he had the same sensation.

When we reached the shack and halted, however, my strength suddenly deserted me, and in order to build the fire I had to sit down in front of the tin stove. Never before had we such occasion to rejoice in our fidelity to our iron-clad regulation that the night's supply of wood should always be chopped before leaving camp in the morning. While I was building the fire, poor Pascal was getting his frozen moccasin and socks off the wet foot, the toes of which were white and solid chunks, though he had only expected to find frost bite.

I constituted myself doctor, and with Pascal's approval packed the foot temporarily in snow and then took an old wooden box that I found and went out to where I had noticed an uprooted tree with earth clinging to the base, and with the aid of the axe I managed to get the box full of this earth. On the way back I was so tired that I had to sit down and rest some fifty feet from the camp before I could gather strength enough to reach it. Neither of us wanted supper now. The hunger had passed and we were literally too tired to eat. This is the only occasion that I can recall having reached this desperate pitch. I thawed out the earth in the box, pulverized it, and when no more frost remained, buried Pascal's foot. Half an hour later the earth was again frosty all around the toes, while they were thawed out. This method is better than cold water.

We wrapped the toes up in raw caribou as well as we could, and went to bed exactly at midnight. Of course our hunting trip ended right there. Next morning Pascal's foot was very swollen and painful, and it was impossible to get a moccasin on it.

Pascal made himself a sort of enormous shoe from sacks which we emptied for the purpose, but he was unable to haul the sleigh or to put any strain on the foot, so I had to get in harness and do this work. He was a regular ox at hauling, but I had never tried it before, except a few hundred yards for the fun of the experiment, and when we reached one of Pascal's hunting camps ten miles further down the river, I was exhausted. We had made a very late start, and as the afternoon was now well advanced we put up there for the night.

I have no objection to portaging on my back; in fact, I rather enjoy it when it does not come too often, but on reaching Pascal's camp that night I vowed that if I ever again hauled a sleigh, it would have to be loaded entirely with gold nuggets. I have kept the vow. Incidentally I may mention that the nuggets have not yet turned up.

It snowed all night, and next morning I abandoned the sleigh and decided to send two men after it later. Pascal did not say much, but he was suffering intensely, and I think he was very glad that there was light enough to enable us to make the final distance to the village—a distance of thirty miles—without camping again. He left his cabin that morning like a decrepit old man, but later his foot got broken in and was less painful.

On the way down we visited some of his traps along the river and in one of them found a lynx. These animals are most remarkable for vitality. The hunters have a cruel practice of sometimes leaving their traps for three weeks or more without a visit, and Pascal told me that in all his experience he had never found one dead lynx in his traps. We killed this fellow by a blow of a pole over the head. It hissed and spit at us as an angry house cat might have done, but made no effort to spring. When caught in a trap, lynx rarely spring on being approached, unless a blow from the pole catches them on some other part of the anatomy than the head. In the latter case they set up an awful caterwauling, and sometimes try to spring and scratch, but this more in an effort to get away than to attack.

A lynx which I once saw wrench himself loose by springing shot off to one side as soon as he found himself free, as he went taking a piece of stocking from the man who had missed cracking the skull with his pole.

I have often noticed a curious tendency lynx have to follow other tracks, whether of a snowshoe or a moose. But as they never come in sight while following a snowshoe track, it is hard to imagine their object, unless it be like that of a gull following a steamer.

I broke trail for twenty-five miles in front of Pascal that day, ending up in almost the same condition as on the night of the antlers, for the snow was heavy. Our last five miles was on a logging road. On our arrival at the village, Pascal's foot was a case for the doctor. The poor fellow must have suffered intensely, and nearly all the flesh fell off from a couple of his toes. His snowshoeing for that winter was over.

THE TOP RAIL.

He could talk plainly enough when not flustered, and even then his words were not always unintelligible, if you shifted the vowels about a trifle. He roused me out of a sound sleep one rainy night by piling into my tent with his air bed and blankets and a peremptory demand to "lie over" and make room for him. Peeved at the intrusion, I asked, "What's the matter with your tent?"

"The reeflukes," he replied.

"The what?"

"The reeflukes," he repeated, as he tucked a pair of muddy moccasins away in a corner of the tent.

"Well, why don't you—"

"The reeflukes; the riflooks—the roof leaks," he stammered, throwing his dripping sou'wester at my head, in ultimate triumph over troublesome vowels.

Why is it that all the world loves to tease those who, through some impediment, cannot pronounce words in the orthodox fashion? I know a canoeist who cannot utter three consecutive words without great effort, and yet he sings perfectly in a clear tenor. To listen to one of his songs around the camp-fire fills one's heart with peace. On a dark night he and a companion were overtaken by a heavy squall while crossing wide waters in a tiny cedar canoe. The water was so cold that both men, powerful swimmers though they were, knew they could scarcely make shore should their canoe swamp. They nursed the little craft along, merely keeping headway to ride out the storm, and sang old cruising songs until the lights of camp came into view after the worst of the storm had passed over.

* * *

Looking out the window one day I saw a cat creep across the lawn and crouch behind a tree, facing a small-mesh wire fence. Outside the fence several sparrows were fluttering about in the short grass, and if they saw the cat they displayed no interest in her presence. Perhaps they knew from experience that the fence would protect them. But if the cat saw the fence, her actions were strange, for she sprang full at the birds, and plunging head on against the flexible wires, was tossed back, and when she had regained her footing she turned her head this way and that, as if to make sure her neck was still in working order. Just then an arrow struck her amidships, and the two surprises, coming so swiftly, were too much for her to analyze—in the immediate vicinity. Her actions in catching birds since then lead me to believe this cat can see perfectly.

* * *

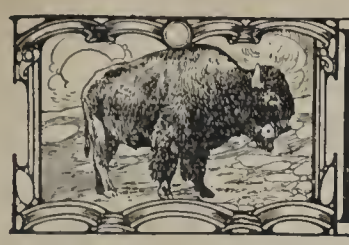
Some of the advertisements in the British sportsmen's papers are clear enough to all those who are familiar with various favorite waters for fishing, but seem strange to others. Here are a few of them:

"Laerdal River, Mo and Honjun beat for season."

"Excellent fishing with small furnished house conveniently situated."

"Sundal River, Hol beat for June and July."

"Our maggots have won more trophies than any or all on the market." Grizzly King.



NATURAL HISTORY

American Museum of Natural History

For some months it has been an open secret that friction has existed in the administration of the American Museum of Natural History. This has now been ended. Prof. Hermon C. Bumpus has tendered his resignation as director and, it is announced, has accepted the office of business manager for the University of Wisconsin, one of the great educational institutions of the Middle West.

Prof. Bumpus entered the service of the museum as director in 1901. In many ways he has given the museum a most efficient direction, being energetic and resourceful, and introducing many new and valuable ideas, especially in the line of exhibition. The difficulties which he had prior to 1907 with some members of the anthropological staff arose in part from the fact that some of the distinguished men who composed that staff, such as Prof. Franz Boas, did not sympathize fully with the ideas and policy of the museum regarding popular education, and the arrangement and exhibition of their collections. This matter formed a prominent feature of Mr. Jesup's administrative policy. In connection with the resignation of several of these officers, personal feeling was developed which led to the withdrawal, not only of the scientific support of these men, but of the patronage of several excellent friends of the Anthropological Department. There thus developed in some of its former friends a spirit of antagonism to the museum which might have been avoided by the exercise of more tact and judgment. In the closing years of his administration, President Jesup was in bad health, and left matters more and more in the hands of the director; thus it came about that some of the powers, rights and duties of the curators as defined in the rules and regulations of the museum were disregarded, and the administration became more a personal one. On the other hand Dr. Bumpus made many admirable appointments and recommendations, so that the staff was re-enforced by the addition of some of the best men in the country in various departments. However, the staff of the museum became divided into two parties, those who were working with the director, and those who were silently accepting the situation and surrendering some of their rights and prerogatives.

The case of Curator Dean, who was promoted from the position in charge of fossil fishes, to that of full curator of fishes and reptiles, brought about the recent difficulty, because Curator Dean stood on his rights of independent judgment in the matter of the detailed supervision of his departmental affairs. The suspension of Curator Dean from active service occurred during President Osborn's absence in the West, and brought up before the executive committee the question as to the respective rights and duties of the curators, with relation to the office of director, as well as the powers of the director with relation to the president, who by the constitution of the museum is its administrative head.

Curator Dean had rendered the museum admirable service and was eminently qualified for his position, and in fact possessed exceptional experience and capacity for museum affairs. Moreover, he had never had any administrative difficulties either with his subordinates or superior officers in other institutions. The question raised by his suspension was such a large one that it seemed best to accept his resignation without further investigation during a period in which the internal administration of the museum could be carefully reconsidered by the trustees, and if necessary more precise definitions made of the duties and powers of the members of the staff and of the director respectively. Curator Dean's resignation in no way reflects upon his capacity, and it is likely that in the near future he will be the most prominent candidate for his former post, provided he is willing to accept a fresh call from the trustees.

Pending the solution of this question it was deemed advisable that Director Bumpus should also withdraw from his position, and he was granted a leave of absence beginning June 13. In the meantime the New York Zoological Society generously came to the aid of the museum as a sister civic institution, and temporarily surrendered Director Charles H. Townsend, of the New York Aquarium, who was appointed by President Osborn, acting director of the museum, and for a period of eight months has filled the office with great ability and success.

The original system of the internal administration of the museum was laid down by Prof. Osborn in 1901 while assistant to the president, at the request of President Jesup, and forms the basis of the existing rules and regulations whereby certain clearly defined duties are assigned to the curators, to the faculty as a representative body of curators, and to a publication committee, chosen from the heads of the various departments. This system was reinstituted with full force on July 1, 1910. It is working with entire satisfaction to the staff, and it does not appear probable that any material changes will be recommended by the investigating committee. No personal differences now exist within the walls of the institution. At the time Acting Director Townsend assumed his office, it was clearly agreed with the New York Zoological Society that he should return to his duties as director of the Aquarium, which, under the energetic management of the New York Zoological Society is about to enter upon a period of great expansion in connection with the building of a monumental new Aquarium, the preliminary plans for which have already been prepared and published.

The action of the board of trustees in accepting the resignation of Director Bumpus indicates their conclusion that someone can be found of equal ability in the line of general museum administration, who will carry forward the work of this great institution under President Osborn harmoniously, and in the best interests of science and the cause of popular education to which the museum is devoted.

Broad plans for the enlargement of the museum on the zoological and geological as well as on the anthropological side are now before the trustees, as is also an elaborate report by President Osborn on the future plan and scope of the institution. This will soon be issued and gives an ideal of development for the future, embracing several branches of science, such as astronomy, oceanography and geography, which heretofore have not been embraced within the plans of natural history museums, but will become important parts for the completely rounded and developed museum, in which is embraced not only animal life in all its manifold aspects, but the terrestrial and cosmical environment of life as well. Beginnings in astronomy have already been made under the advice of Director Bumpus, and have proved most interesting to the public.

The trustees of the museum are contributing to the support of the various departments more liberally than ever before. Expeditions are now in progress in Asia, Africa, South America, as well as in all parts of North America, and there is every reason to expect that the museum is entering the brightest period of its history.

European Widgeon in Wisconsin.

Green Bay, Wis., Jan. 18.—*Editor Forest and Stream:* Regarding European widgeon reported in your last issue, I may say that I killed a very perfect male this fall on the 23d of October, and that two more were killed on Green Bay this last season.

During the past ten years I have killed three males and two females, and while a scarce duck, they are found here from time to time, and are often thought to be a hybrid by the ordinary hunter unacquainted with the various ducks.

The bird I killed was a chance shot made after the pair of birds had passed over one blind too high for the gunners to shoot at. I picked up a big ten-gauge gun loaded with No. 2 shot for geese and killed the bird which fell eighty-eight measured yards back on the land, and when shot was high in the air. One No. 2 shot had broken the neck and one hit the body.

As the distance was figured by the gunners in the other blind, it was one of Almo's old time shots, but it was not made with No. 10's as he used to do.

A. G. Holmes.

London Market for Feathers.

The London market for the importation of plumage for ladies' hats is the largest in the world, and it is estimated that 5,000 people are employed in the manufacturing and other work incidental to this trade. The value of the imports is said to be seven or eight hundred thousand pounds ($3,500,000 to $4,000,000) a year.

Labshankar Laxmidas, of Junagad, India, under date of June 17, 1910, has addressed to the President of the United State a printed "Prayer for Mercy," asking that the United States pass a law "for the protection of millions of birds in this eountry [India] from the horrible cruelties inseparably connected with the trade in live wild birds."

New York Zoological Society Managers

THE annual meeting of the Board of Managers of the New York Zoological Society was held on Tuesday, January 17th, at the office of Percy R. Pyne, 30 Pine street, New York, the President, Dr. H. Fairfield Osborn in the chair.

The usual annual reports were made; the officers and the executive committee of the previous year were re-elected.

The Secretary, Mr. Grant, gave the substance of the annual report of the excutive committee, which will be printed in full in the society's annual report. The financial condition of the society has never been so good as at present. Quite apart from the great feat of raising an endowment fund of a quarter of a million of dollars, the revenue to the society from the sale of animals, the restaurant and various privileges amounted during the year to $26,000, a sum larger than has previously been received from these sources.

Curator Beebe, at last accounts, was in China and reported that he had been very successful in collecting specimens, living and dead, of the various pheasants occurring in the regions through which he passed. These specimens and the publication on the pheasants which is to follow Mr. Beebe's return, are due to the generosity of Colonel Kuser, a member of the board of managers, who is bearing the expense of the expedition.

Mr. Grant called special attention to the new plans for the aquarium and stated that the alterations, if made, would treble the exhibition space in the building, would give room for a great marine museum and for a great marine biological laboratory. When the plans for the aquarium have been carried out, it is likely to be one of the most important educational institutions in the world.

Dr. W. T. Hornaday, the director of the park, made a verbal report announcing that the society now had on exhibition one of the two living walrus in captivity, a unique herd of musk oxen, two wild polar bears, captured by the Rainey-Whitney expedition, and a spectacled bear, captured in the Andes of Ecuador. This is no doubt the rarest bear species in the world—except the Aeluropus of Tibet. A large order has been sent out to a firm in East Africa, which makes a business of capturing wild animals, and it is hoped that before long a number of large rare and showy animals may be received from that source. Among these may possibly be a white rhinoceros, and hopes are entertained that a pair of reticulated giraffes may also come to hand.

The health of the animals at the Zoological Park continues extraordinarily good, and the loss by death and disease is very small. The collections there now represent between 1,100 and 1,200 species of animals, and the specimens on exhibition number more than 5,500.

During the past year the administration building has been open and now forms a pleasant and comfortable meeting and lounging place for the members of the society. The National Collection of Heads and Horns is exhibited in this building, and this collection has during the year been greatly increased by the addition of a large number of remarkably fine specimens. Particularly interesting are two heads of markhoor and two heads of ibex received from Gilgit on the border line between Cashmir and Tibet.

In the absence of Dr. Townsend, the director of the aquarium, some facts concerning that institution were reported on by Dr. Osburn. The annual attendance is not quite as large as that during the Hudson-Fulton Celebration in New York, at which time there was a great congregation always at the Battery; but the attendance the past year was something over 3,300,000. The collections are enlarged and in better health than ever. Special attention is called to the pair of fur seal pups now on exhibition there, whose interest has already been adverted to in FOREST AND STREAM.

AN OKAPI.

Okapi for American Museum.

A CABLEGRAM recently received at the American Museum of Natural History from Messrs. Lang and Chapin of the Museum's African Expedition, tells of the capture of a male, female and calf okapi and their shipment to the museum.

In May, 1909, the museum's Congo expedition left New York for Africa. The funds for the expedition were furnished by Cleveland H. Dodge, J. P. Morgan, Jr., Wm. K. Vanderbilt, A. D. Juilliard, Robert W. Goelet, William Rockefeller, John D. Trevor and Charles Lanier. Several reports of the expedition's progress and success have been printed in FOREST AND STREAM.

It seems but a few years since the announcement was made of the discovery in the dense forests of Central Africa of the okapi. Rumors concerning it had reached the ears of African explorers as far back as the time of Henry M. Stanley, but it was not until 1901 that Sir Henry Johnston secured a part of the skin of one of these animals and two skulls, from which material the animal was formally described. Later complete specimens were brought to Europe, where three are now on exhibition.

The animal, which is quite unlike any other known, has been said to resemble externally a horse and a giraffe, two wholly unrelated species. It is gray or dun-colored above, with black stripes on the belly and legs. Much of the head is bright red, and it has horns, or rudimentary horns covered with skin, like the giraffe.

The material secured for the museum consists of skins and skeletons of the specimens, together with the trees, shrubs and other plants among which the okapi lives.

The okapi is most nearly related to a fossil animal found in the deposits of Greece and Asia Minor, and its nearest living relative is the giraffe. On the other hand its neck is not proportionately as long as the giraffe's. It lives in the forest and is believed to subsist largely on the twigs and leaves of shrubs and trees. The natives capture the animal in pitfalls, dug in the trails which it follows, and its brightly colored skin is by them highly valued for belts and other ornamental purposes.

When the group in question is mounted for exhibition in the museum, it will be absolutely unique and will prove of the greatest interest to visitors to that institution.

GAME BAG AND GUN

A Chicken Hunt in Manitoba.

NEW YORK CITY, Jan. 21.—*Editor Forest and Stream:* Having noted the article in your issue of January 14th, regarding the game conditions in Saskatchewan, I thought you and some of your readers might be interested in a little prairie chicken hunt that I enjoyed this fall at Oak River, Manitoba.

This town, a few miles east of the Saskatchewan border, is surrounded by the same type of prairie country as is found throughout the greater part of the above province. Having completed my work with Glen Osborne, the local hardware and sporting goods dealer, I suggested that he join me in the field until train arrival. Being an enthusiastic hunter himself, Glen immediately consented and set off to find Doc, the local veterinary, to do the driving.

At just three-thirty Doc drove up with a big gray mare and stout buggy. Doc, by the way, proved a good sportsman, and, with his gray mare, who thought no more of walking over four-foot brush than over four-inch wheat stubble, made the best combination I have ever hunted with.

Following the prairie trail north, Doc soon brought us into the open, and turning out of the trail, struck off over the stubble toward the bluffs (thickets), in which the chickens conceal themselves during the middle of the day and early part of the afternoon.

After we had passed several of these without starting anything, a very likely looking bluff was approached. As the mare drew near a big jackrabbit started along the edge of the thicket on my side. Swinging the gun into position, I dropped him with a charge of No. 6 shot at twenty-five yards.

Glen and I then dropped out of the wagon and each took a side of the bluff, which was about forty yards long and from ten to fifteen yards wide. About half way along this, a beautiful cock bird jumped from the center and circled directly in front of me. As he was only a few yards off, and flying in perfectly open space, he fell an easy victim to my first barrel. Tossing the bird in the wagon that followed closely to us, we climbed in and drove to another bluff a short way ahead. Glen again took the left and I the right. Just as we approached the far end a bird jumped from the center and was promptly covered by Glen, but as the bird turned in my direction, he lowered his gun and allowed me to drop it.

Several more bluffs were beaten out, but no birds started. Doc then swung the mare across the stubble toward a slight depression well covered with patches of low brush. As he drove by one side of this, several birds were seen in the stubble on the opposite edge. He then drove out of sight behind some bushes, Glen and I climbed out and carefully approached the birds through a hollow bluff. Upon reaching the end of the cover five birds bounded into the air with so much noise that we became confused and managed to secure only one apiece. Marking down several of these, I proceeded to the left while Glen followed around the right side of a series of small bluffs.

A few minutes later I jumped a bird directly in line with the sun and consequently missed with both barrels. A short distance further on I jumped two almost together, and managed to secure one. Glen on his way over shot one of the birds previously marked down.

Doc, having marked down the two that I missed, now gathered us in and started the old gray on a run across country. By this time the birds had left the bluffs and were in the open seeking food. One of these jumped from under the horse's feet and gave me a most beautiful shot while quartering away to the left. Though I fired both barrels, he continued his flight, and settled in a bluff a short distance off. Glen and I followed and soon the bird dropped in response to the bark of Glen's gun. A little later a flock of a dozen birds jumped ahead of us and quietly faded away in the distance. On approaching a good looking bluff, Glen and I alighted and presently had two birds in the air. Glen managed to reach one, but the other was too far off.

Doc from the wagon marked number two down, and soon had us on his heels. The old fellow, however, was somewhat scared and took to wing out of range. Later two more were started on the off side of a bluff. Doc once again from his high position marked them down near a straw stack, distant about a half mile.

Approaching this carefully from the point of a bluff, we both emerged in time to see one of the birds rise on the near side of the stack. Both guns barked simultaneously, and the bird dropped. Secretly each thought that his shot had done the deed.

On glancing at my watch I saw that it was nearly five and I must return for the five-thirty train. The last bird was gathered and laid with those in the wagon, that making nine birds and a jackrabbit as the result of the hour spent afield.

On the way back Glen missed an apparently easy shot from the wagon. But, as in my case, the motion destroyed his aim. A large flock also passed directly over the wagon, but out of range. Town was reached just as the train drew into the station, so I hastily bade good-bye to my good friends, and gathering my gun and grip, boarded the train.

This was one of the most pleasant shooting trips that I have ever enjoyed. With a good horse and driver, chicken shooting is truly a royal sport. Being almost entirely in low scrub or open stubble they are much easier to shoot than their Eastern brother, the ruffed grouse.

While passing I might state that I disagree with the natives in regard to the style of gun and size of shot needed. The prevailing style used is a heavy full choked thirty-inch barrel, twelve gauge with usually number four or five shot. Personally, however, I found a light brush gun with twenty-eight-inch barrel all that was desired. I also found number six and even seven shot quite heavy enough.

In practically all of the more recently settled parts of Manitoba and Saskatchewan, the prairie chicken was very abundant this fall. During a few hours' ride on the train I have frequently seen dozens of these beautiful birds from the car windows. W. A. CHANDLER.

North Carolina Legislation.

RALEIGH, N. C., Jan. 11.—*Editor Forest and Stream:* A bill, which is different from any on record in the State, has been introduced in the Legislature. Its author is representative Jack Dillard, of Cherokee county, the most westerly in the State, and it is for the protection of inland fish and game, placing the work in the hands of what is to be known as the North Carolina Game Commission, composed of three members, to be appointed by the Governer. It is the purpose of this commission to take the place of the State Audubon Society, and it is said that the latter will not antagonize the measure.

The Legislature two years ago took many counties from the control of the Audubon Society and considerably crippled the latter. It is said that the counties thus taken from under the supervision of the society have not done very well. Under Mr. Dillard's bill the game commission is given great power, governing the fishing and hunting, being given authority to appoint county wardens and make rules as to the amount of game which may be killed on a single day, and to close the hunting season in counties as long as it is considered necessary, where game is found to be scarce, and needs to be put under special protection. The wardens are to be paid out of the license fees of $10 for non-resident sportsmen, this being the present amount. The bill does not cover salt water fishing, but is intended to protect waterfowl.

F. A. OLDS.

Reports from Currituck county, N. C., indicate that since the charge of this county in respect to game and other birds was taken from the Audubon Society, very little regard has been paid to the law, and it is declared that in many parts of that county each man is a law to himself. Residents of the county have organized a game and fish league, but market gunners and fishermen there seem to feel that this league exists chiefly for the protection of its members against the operations of the law.

Meantime, as already suggested in FOREST AND STREAM, the wildfowl seem to have taken the matter of protection largely into their own hands, and except on stormy days and during the night, spend most of the time out at sea, where they are safe from pursuit by battery man, point shooter and bush blind shooter alike.

All the game laws of the United States and Canada, revised to date and now in force, are given in the Game Laws in Brief. See adv.

Boone and Crockett Club Report.

At the annual meeting of the Boone and Crockett Club, held Tuesday, Jan. 24, at the University Club in New York City, the Game Preservation Committee presented its report. This committee was appointed at the annual meeting of 1910, its chairman being J. Walter Wood. The other members of the committee are Dr. Charles H. Townsend. Geo. Shiras, 3d, Charles Sheldon, W. Redmond Cross, and George Bird Grinnell. The committee recommends the appointment of a regular standing committee to deal with the subjects of game preservation and game refuges, and points out various ways in which such standing committee may advantageously work.

Its report of the work of the committee for 1910 tells what was done to assist the passage of the bill establishing the Glacier National Park, introduced some years ago by Senator T. H. Carter, of Montana, a member of the club; of efforts made to secure from Mexico and Texas a herd of antelope for introduction on the Wichita Game Preserve, and of other efforts now being made to secure antelope for the Wichita and the Montana buffalo preserves. The committee aided in securing from Congress a small increase of appropriation for the care of the fenced herd of buffalo in the Yellowstone Park, which now numbers something over 120 head. No action was taken in relation to proposed changes of deer law in New York State. The committee urges that the influence of the club should be used in behalf of the Appalachian Reserve bill, prepared by Hon. J. W. Weeks, which has passed the House of Representatives and is to be voted on by the Senate February 15th next. It expresses the view that excessive killing of northern game by wealthy hunters who visit the Arctic for sport should be frowned on, while advocating the killing of game, in whatever numbers their needs may call for, by travelers, natives, miners and explorers.

The Game Situation.

Reporting on the game situation, it is pointed out that most of the domesticated buffalo in Montana have been sold and delivered to the Canadian Government. The United States national herds in Montana, the Yellowstone Park and Oklahoma are increasing. A national herd should be acquired for the Glacier Park. The six muskox calves, brought back from the Arctic by Paul Rainey and Harry Whitney, and now on exhibition in the park of the Zoological Society, offer the hope that these animals may be perpetuated in confinement.

In the Northeast and in the neighborhood of the Yellowstone Park and Rocky Mountains, moose are holding their own or even increasing. Reference is made to Mr. Shiras' interesting articles on the Yellowstone moose, published in Forest and Stream.

Caribou seem wholly to have disappeared from Maine, and are growing much scarcer in New Brunswick and Nova Scotia.

The elk, abundant only in the Yellowstone Park and its vicinity, present there a difficult problem. It is thought that the Southern herd must be exterminated by starvation, unless some means can be devised for introducing them to a winter feeding round. There are still a few elk in the Olympic Mountains, in British Columbia, and in the Glacier National Park. There are some dwarf elk in California. In New England no one seems to know what to do with the Virginia deer.

Antelope, protected all over the United States, may still be shot in certain Canadian provinces. The protective law of Arizona expires March 11, 1911.

White goats are abundant, and mountain sheep are certainly not decreasing.

Bears are growing fewer, except in protected districts like the national parks. The Kadiak bear has become scarce.

Beaver have greatly increased. The fur seal herd on the Pribilof Islands grows constantly smaller, owing to pelagic sealing.

It is suggested that in some States careful protection has resulted in such an increase in the number of certain wild animals, that complaint is made of the damage done by them. This is true of deer in New England, and of elk and beaver in some Western States. These wild animals should be protected and grown for man's use and benefit, just as a forest is grown and protected, but they should not be turned over to the public so as to induce a wild scramble, where each individual is engaged in a struggle to secure more of the game or fur than his fellowman gets. In localities where beaver are abundant the committee is disposed to suggest legislation authorizing local governments to cause to be trapped each year a reasonable proportion of the beaver and to sell their skins for the benefit of the protective work. Such trapping should be retained in government control—it should not be opened to the public. Certain hoofed game might be domesticated and reared for sale, as has often been suggested.

The Yellowstone Park, now a reservoir of large game animal life, should be drawn on to supply other National Parks and any game refuges that may be established. Congress should make an appropriation for the transfer from the Yellowstone Park of large game animals, at least to the buffalo parks in Oklahoma and Montana, and to the Glacier National Park.

A resolution accepting the report of the committee and embodying its recommendations was adopted by the club. Later Mr. Wood, the chairman, made a supplementary report announcing that under authorization of the Secretary of the Interior and with the co-operation of the Agricultural Department, the Acting Superintendent of the Yellowstone Park had caused to be captured twelve antelope, which had been shipped to the buffalo reserve in Montana, and eleven antelope which had been shipped to the Wichita game preserve in Oklahoma. Of those shipped to Montana four were bucks, and eight does, while to Oklahoma went four bucks and seven does. There was a loss by death of three of the animals shipped, these being bucks that had killed themselves in the crates.

The cost of all this work—the gathering, crating and shipping these animals to their destinations—was borne by the Boone and Crockett Club.

A letter received by the chairman of the committee from Major Brett, Acting Superintendent of the Yellowstone Park, gives an interesting account of the capture and shipment of these antelope. It says:

A shipment yesterday of two fine buck antelope to Oklahoma completes the work for the present. Twelve in all were shipped to Montana, of which four were bucks and eight were does. Eleven were shipped to Oklahoma, of which four were bucks and seven were does. The original idea was to ship ten to each place, but a letter from Mr. Hodges, warden at the National Bison Range at Dixon, Mont., dated Dec. 20, stated that one of the bucks that had been shipped was dead when received, and another letter from him, dated Dec. 30, stated that he had been unable to locate the other buck on the range, and he was afraid that he also was dead. It was, therefore, thought advisable to ship two additional bucks to Montana, so as to be sure of at least one with the herd, and this was done on Jan. 6.

A telegram from Mr. Frank Rush, Forest Supervisor at Cache, dated Jan. 8, stated that one of the male antelope shipped Dec. 31 was dead, so an additional buck was sent to Oklahoma.

As yet final reports have not been received from either Montana or Oklahoma, but it is hoped that there may be no further casualties, as our herd is badly stirred up, and it is not advisable to disturb them further this season.

I note your request for an account of the methods employed in making this capture. The details were left to the judgment of Scout James McBride, who has been in the service for a number of years and has had previous experience in capturing and shipping grown antelope and black-tailed deer. He was assisted by one of our other scouts, two men being sufficient for the work. The work was well done, only three being lost in catching the twenty-three that were shipped. Even these three were not injured in catching, but killed themselves after they were crated. The method employed is as follows:

These antelope were captured in the Park at their feeding grounds near the northern entrance to the Park by means of a trap consisting of a pen about fifteen feet in diameter made of Page woven wire fencing with a strip of chicken wire above the Page wire, the top of the chicken wire being slanted toward the center so as to throw the antelope back when they try to get out. A gate, which is made of boards, is held open by a catch which can be readily released by means of a trigger, and the gate is weighted so it will close as soon as the catch is released. All is very thickly padded with gunny sacks stuffed with hay, excepting a small section of the fence immediately opposite the gate, which is filled in with fine chicken wire that is not noticeable from the gate, thus giving the appearance of an opening. Experience has taught that without this apparent opening opposite the gateway the antelope will not enter the inclosure. At first the trap was sprung by the antelope, by means of a fine wire stretched close to the ground inside of the inclosure, and covered with alfalfa hay which was placed in the pen to bait them in. Later it was found preferable to spring it by hand, so a fine wire was strung to a hiding place about 400 feet away, and the men lay in wait and sprung the trap by this wire. In this way they only sprung it when antelope that seemed most desirable were inside.

The utmost silence is necessary, as they frighten at a slight unusual sound, and some-

times do not return for several hours after being startled. It is very tedious work, as the men sometimes have to wait for hours at a time without results. As soon as the gate is sprung two men go immediately to the trap, enter, and catch the desirable animals in their arms and tie their feet. The undesirable ones are then released. The others are then untied, and put in the crates, which are always prepared in advance ready to receive them.

The crates are made of light one-inch lumber, with tight floors, and sides tight for about half way up so they cannot get their feet through and injure their legs. They are put in through a sliding door at the rear end of the cage. Most of the crates were made double, with a tight partition through the center, thus having two animals in each crate, but in entirely separate compartments. The inside dimensions of each compartment is 4 feet long, 1 foot 9 inches wide, by 3 feet 6 inches high. Some think they would ship better in smaller quarters, but our men, after their additional experience of the past few weeks, still maintain that these are the proper dimensions. Of course the inside of the crate is thickly padded with sacks of hay. They all struggle more or less when first captured. Most of them quiet down after a few hours, but some, more especially the bucks, are liable to continue to struggle indefinitely and eventually injure themselves. Strangers are kept entirely away from them until they are shipped, and every effort has been made to keep them away en route, both by placards on the crates and by special requests to express messengers. Much of their struggling is overcome at first by tipping the crates up at the front to an angle of about 45 degrees, so that they slip back on the floor and are unable to gain impetus when they try to hurl themselves against the side of the crate. We have even found it necessary to ship some of the bucks with the crates slightly elevated in front. The bucks are shyer than the does, much more difficult to catch, and also much more difficult to handle and tame after they are caught. * * * *

Personally, I. feel well satisfied with the results of this attempt, the loss being smaller than I anticipated. It would not be advisable, however, to repeat the experiment this season, as the herd is pretty much stirred up and scattered, and needs the regular feeding which had to be discontinued to some extent, and very careful handling for a time, to restore the animals to their usual tame condition.

Game Bird Rearing in 1909.

THE report of the Commissioners of Fisheries and Game of the State of Massachusetts for the year 1909 gives interesting information about the efforts to breed bobwhite quail and ruffed grouse in confinement at the Sutton Hatchery. These efforts, while attended by no phenomenal success, had good results and led to conclusions that the feeding and care of young or old birds present no special difficulties except in so far as the food of the old birds may affect the vitality of the embryos or young; that infectious diseases—provided sufficient intelligent and careful attention is given—do not present the menace formerly feared; and that the most serious problem now to be considered is the maintaining a maximum vitality in the breeding birds and their progeny.

No ruffed grouse were reared from the breeding stock of four birds, but from twenty eggs from wild birds, hatched in two lots, four grew to practically full size and seven were reared.

From a breeding stock of sixty-six quail, 1,447 eggs were secured, of which 207 were infertile. One quail laid 102 eggs. Some of these eggs were hatched in incubators, and some under hens. The hatching numbered 691, of which 176 soon died. Three hundred and sixty-one grew to the age of one month, but at a later date a large number of these died from various causes, chiefly from diseases which are still little understood.

It is recalled that during the season of 1910, about 400 quail were raised successfully at this hatchery.

The FOREST AND STREAM *may be obtained from any newsdealer on order. Ask your dealer to supply you regularly.*

New York Legislature.

ALBANY, Jan. 24.—*Editor Forest and Stream:* Assemblyman Patrie, of Catskill, has introduced two bills, relating to taking suckers by hooking through the ice in Greene county, and to prohibit the hunting of hares and rabbits with ferrets, making the possession of ferrets presumptive evidence of their illegal use.

Senator Emerson, of Warrensburg, has introduced a bill, striking out of Section 56 the provision making it a misdemeanor for any person who shall cut, or cause or allow to be cut, coniferous trees within the forest preserve counties without cutting off all the branches at the time of cutting the trees.

Senator Holden and Assemblyman Hammond, of Syracuse, have introduced a bill providing for the establishment of a College of Forestry at Syracuse University.

Senator Hamilton, of Ripley, has introduced a bill relating to the taking or possession of whitefish less than two pounds in the round.

Other bills introduced:

By Assemblyman Sullivan, providing that in parts of Erie and Chautauqua counties, which border on Lake Erie, Wilson or English snipe may be taken in April.

By Senator Burd, relating to Lake Erie mullet, suckers, carp and catfish.

YELLOWSTONE LAKE.

Wildcats Kill Deer.

THE prevalence of wildcats in the Forks plantation in Somerset county has been called to the attention of Chairman Brackett of the Fish and Game Commission by Game Warden F. J. Durgin. The warden recently found tracks of eleven wildcats in one drove, and says it is a common thing to see three, four and even six at one time. He thinks something drastic must be done to get rid of these animals, as they kill many deer.

He says he has tried to run a wildcat down on the snow, but was never able to get very near. He says a large wildcat can easily kill a deer. The State, it is recalled, pays $2 bounty on wildcats, and abopt $1,000 has been paid out this year for that purpose—Lewiston Journal.

Attacked by a Black Bear.

Linville Falls, N. C., Jan. 16.—*Editor Forest and Stream:* A round dozen black bears have fallen victims to the mountaineers' persistent pursuit with hounds within ten miles of this place since the first of October. The last one, and the largest killed for some years hereabouts, gave the hardest chase I have ever heard of here. It was credited with the killing of many hogs, and it led the hounds and hunters for five days and nights, covering a good part of the extremely rough country on Grandfather Mountain and finally returning to its original feeding ground near a lumber camp in Lost Cove, about eight miles from here. The longest-legged of the hunters and the most experienced, Stover Wise, finally made a desperate effort by climbing across a deep hollow and up to a high ridge, where he expected the distant dogs would drive the bear. He had hardly arrived in sight of the trail the bear was taking, when Bruin hove in sight and the hunter, quite unusual for a mountainer, being armed with a rifle and knowing how to use it, got in a shot at about 100 yeards.

Now comes the most unusual part of the story, and did I not know this man to be truthful, I should doubt it, for I have never heard of a black bear attacking, or giving any appearance of attacking a man, if he had a chance to get away, no matter how badly wounded, unless it was a mother defending her young. But this bear came straight for the tall mountaineer, in the face of the emptying of his magazine of nearly all its contents. The bear did not stop till he was within twenty feet of the man, and was found to have received five bullets in his charge, most of them about the head and shoulders. Wise says the bear came as straight for him as it could and never wavered, though he is not certain whether it was simply dazed by the first shot and did not know where it was going, or if it really intended to attack him. He has hunted bears all his life, as his father has before him, and they were both born here. None of the many bear hunters here has ever heard of a black bear attacking a man.

I would be glad to hear if anyone knows an authentic case of a black bear attacking a man, even when wounded, if it had an opportunity to run. This bear was an old one and exceptionally large and powerful. It had used up several dogs during the race.

Frank W. Bicknell.

[In Forest and Stream of Feb. 8, 1908, there was printed an account of the killing of a man and the partial devouring of the body by a black bear. The statement was sent by J. H. McIlree, of Regina, N. W. T., accompanied by the affidavits of two witnesses to the killing and of the constable of the Northwest Police, who took their statements and saw the body. While William Heffern and James MacIntosh were sawing wood at a lumber camp thirty miles from Etiomamie, N. W. T., they saw a black bear swim a stream near-by. They called the camp cook, T. Wilson, to come out and see the bear. While the three men were watching it, the bear rushed toward him. They ran toward the cook house but the bear overtook and struck Wilson, apparently breaking his neck. Then, according to the affidavits, it carried the body about fifteen feet. By that time the other men were belaboring the bear with such missiles as came to hand, and one of the men secured a revolver and fired ten shots at the bear, but the latter continued to retreat with the body, finally eating part of it before a man with a rifle shot it twice. The bear fell at each shot but finally got away. The date given was May 17, 1907.—Editor.]

Wild Geese in Flight.

Omaha, Neb., Jan. 20.—*Editor Forest and Stream:* The very last of autumn's sights and sounds have completely flickered out and we are now in the severest throes of winter. Notwithstanding this the Canada geese and hardy mallards have been lingering along the frozen Platte and the rushing Loup—which seldom freezes from shore to shore—ever since the fall months closed. The big flock of honkers I saw Sunday evening, flying in full chorus, bound South, over my home in the village of Dundee, unequivocally proclaimed that they were fleeing before the threatened storm. Sadly other knights of the hammerless may have gazed at that baseless triangle drifting athwart the lowering skies, and like myself may have vainly wished for the power to accompany them to regions where ice and cold and sleet are rarely seen. The hoarse clamor that fell from the flying wedge and filtered through the frosty space, vibrated upon the twilight atmosphere glorious, sweet and solemn, yet producing a longing for the dawn of spring that will bring them back again. Yearningly I watched the vanishing cohort until they faded away amid the gathering shadows in the southern heavens.

To speculate a bit on the flight of the geese. Have you ever tried to fathom the mystery why these birds make these long migrating journeys in the form of a wedge? How is that cleaving triangle maintained through the endless vault of space? Do the two lines of geese, the long arms of the wedge, fly straight at the indomitable old gander leading the way, or does each simply maintain a straight forward course irrespective of the position of their pilot or the other wing of the wedge?

My theory is that they proceed plump ahead as if in a single string, single file, for if you should lop off either line of flying gray in mid-air, would not the other keep right on its straight course behind the leader, or would they disintegrate, bunch, or form a horizontal line or proceed on in irregular form?

Every wildfowl hunter knows that every flock of geese has its leader, and in these migrating trips it is always a wise old gander that has been over the course many times before and knows the way.

If the leader dies from natural causes, or is killed by hunter or other foes, another is selected to assume command, and the most competent member of the flock is undoubtedly chosen, and it would seem for the sole purpose of showing the way.

Many of my old goose hunting friends hold to this opinion. They believe that geese shape their course by the topography of the country beneath them, by the mountain ranges, the long level stretches of water and land, by capes and promontories and headlands and other landmarks familiar to the leader, flying in an unswerving straight course over land and sea, and so high that a migty stretch of country is always in view, thus enabling them to hold their way with precision and unbroken regularity.

And yet, this does not really explain the wedge-shaped flights. Countless other species of birds make these same journeys, many of them traveling without concerted action or systematic form. Some make these pilgrimages over the sea entirely, never more than skirting the shores. Among these are the cormorants and several varieties of gulls, and while they unceasingly keep over the deep, they seldom allow the shore to get out of sight, and invariably follow its winding way. This route, of course, makes them fly hundreds of extra miles, but is undoubtedly the secret of their finding their way.

In the blackness of cloudy nights, in heavy fogs and blinding storms, you ask, how is it then the geese hold their way with such unerring certainty? We know that their sight, while keen, is not of such phenomenal character that they can see under such conditions, and yet we do know that they make at least portions of their long journeys under just such circumstances, and here is where those who claim that it is the instinct of the birds that carries them safely through have the best of the argument.

My theory is that instinct is but little relied upon, and that it is a pure matter of training by the old patriarchs of the tribe, and has been from the beginning of time, but what about the first flock that ever made the trip from polar regions to tropics, or from the latter to the former? Who taught them, you ask?

That is far-fetched. We might as well inquire which was made first, the hen or the egg, or about the origin of any animal life.

But after all none of these suggestions accounts for the harrow shaped flight, yet they lead up to it. The belief that they travel by the guidance of natural landmarks is surely tenable, for by this manner of flight each bird in both wings of the wedge has as unhampered a view of the vast stretch of country beneath it, as does the leader. This each bird would not have if they followed the leader in a straight line, or flew on a horizontal line.

I do believe that each wing of the harrow progresses straight ahead on a course parallel with the leader. In this position each bird always has the leader in plain view, as well as the whole of the passing landscape beneath it. Those that have been over the course before, the older birds, would need no leader, as the landmarks impressed upon their memories by previous trips would be all that was required to guide them, and they could make the journey alone as well as in the company of others. But the spring's hatch, those that had never been over the course, would need a leader; in fact, several of them, and the wedge-shaped flight is adopted to give them the experience the older birds had had by an uninterrupted survey of the country in transit.

These suggestions are interesting and if anyone is deeply enough versed in bird lore to be able to convincingly explain to me the reason for and cause of this wedge-shaped flight of the wild geese, he will impart a knowledge I never expect to acquire. Sandy Griswold.

Iowa Sportsmen's Association.

DES MOINES, Iowa, Jan. 16.—*Editor Forest and Stream:* The sportsmen of Iowa have for the first time become thoroughly aroused concerning the need of taking intelligent and effective measures for the adequate protection of the fish and game, the forests and lakes of the State. The State gun license of one dollar for residents and the large fund it created brought those interested together and last week there was organized here the Iowa Conservation and Sportsmen's Association. The first meeting, just at the opening of the Legislature, had a large attendance. The immediate cause of the gathering was the necessity of doing something at once to save Wall Lake, in Wright county, in the northern part of the State, which the county supervisors threaten to drain and destroy. The Legislature will be asked to prevent it. The resolutions, after reciting the rapid disappearance of the game from Iowa and the urgent need of prompt action to save the natural pleasures of the rod and gun to the people of the State, declare:

Resolved, That we, members of the Iowa Conservation and Sportsmen's League, recommend to the State Executive Council the immediate employment of a competent game warden at a commensurate salary and the establishment of an effective system of county wardens.

Second—The conservation of all remaining Iowa lakes, lake outlets, waterways and marshes.

Third—The planting of wild rice and wild celery in all the game waters of the State.

Fourth—We recommend the utmost care in the preservation of all forests, tree growths and game covers on State lands.

Fifth—The immediate establishment of State farms for the propagation of game fish.

Sixth—The propagation of native Iowa game birds, especially that most delightful of all game birds, the Iowa quail, and also the selection of the Hungarian partridge for extensive propagation in preference to the Chinese and English pheasants.

Seventh—We recommend also that all fishers and trappers above the age of sixteen years be required to take out licenses on the same terms as hunters.

Eighth—Further, be it resolved, in the opinion of the members of the Iowa Conservation and Sportsmen's League that the Executive Council in permitting the drainage of Wall Lake is making the drain-take and doing a great injustice to all the people of Iowa.

We believe that the natural haunts of game and fish have been destroyed in great part, because of the natural settlement and the cultivation of all the lands of the State, but partly also to a lack of foresight on the part of State authorities in allowing breeding grounds to pass into the possession of private individuals, to the detriment of the great majority of our citizens now living, and the unborn generation to come.

We therefore suggest, in compliance with our rights, that the Council suspend its action in ordering Wall Lake drained, and set a day when all people concerned can appear before it and be given a full hearing.

G. H. JAMESON,
D. E. ALLYN,
L. W. SNUGGINS,
J. W. EICHINGER.

The officers of the association are: President, W. E. D. Rummell, and Secretary, D. Y. French, both of Des Moines.

Major John F. Lacey, former Congressman and author of the Lacey game law, proposes that the northern tier of townships in each county shall be made a game and bird reserve, within the boundaries of which it shall be unlawful to shoot or kill any game or song bird at any time. This would have the effect of setting aside about one-sixth of the State as a game refuge, scattered over the State.

The dollar gun license produced over $100,000 the first year and somewhat less than that amount during 1910. State Game Warden George A. Lincoln, of Cedar Rapids, has been using the money rather carefully, but has made a very large investment in Hungarian partridges, scattered over the State, the results of which are not yet known. Fish propagation has consumed some thousands also. The feeling is strong that fishermen should also be required to take out a license, if they are to participate in the benefits of the license money.

In the opinion of myself and of many other sportsmen and observers, one thing that is most urgently needed in Iowa is to stop spring shooting and give birds an invitation to come and live in Iowa and get fat for fall shooting, which should begin at least two weeks later than it does now, or September 15. Some think it should be October 1. If this were done we would have more game, and at a time when it is in best condition. With a system of honest and competent wardens, the Lacey game reserve scheme and no spring shooting, Iowa would in a few years be an illuminating example of what sensible, temperate conservation will do. We would all be proud of it and more than satisfied with it. F. W. B.

MR. JANTZER'S METHOD OF SUPPLYING FOOD AND SHELTER FOR QUAIL.

The National Beagle Club of America.

CAMDEN, N. J., Jan. 17.—*Editor Forest and Stream:* The February meeting of this club will be held at Martin's, Fifth avenue and Twenty-sixth street, New York city, on Tuesday, Feb. 14, 1911, at 9 P. M., at which time all matters of business which shall be brought before the meeting will be acted upon.

James Mortimer, superintendent of the Westminster Kennel Club Dog Show, has just advised me that beagles will be judged by H. T. Peters, at New York, on Feb. 14, 1911.

CHAS. R. STEVENSON, Sec'y.

A Way to Feed Quail.

NEW YORK CITY, Jan. 14.—*Editor Forest and Stream:* In to-day's issue I notice your editorial on Feeding the Game Birds and want to tell you the most practicable way we have found.

After the snow we take a whole sheaf or bundle of wheat, separate the stalks, distribute them upright around trees near cover and tie them to the trunk, as shown in inclosed rough sketch, bend over the tops and strew loose food in all directions to attract the birds. Should a new snow come, the birds can go underneath the bent-over tops and find the food, as the snow never covers it altogether. We have done this on a ten-inch snow and later had another twelve-inch snow on top of that, but found there was plenty of food left, and always one side of the bundle that was not covered. We had a sixteen-inch fall of snow at Eastport, L. I., last month. Our warden at once tied out one hundred sheaves of wheat, and after two days, visited them all and found that the quail had been to every one, and that all the coveys he knew of were intact.

We have tried every way known to us, and find this the simplest and best, and in six years have not lost any birds because of snow.

Our FOREST AND STREAM is better than ever.

GEORGE E. JANTZER.

New Conservation Magazine.

THE National Conservation Association, of which Gifford Pinchot is president, will publish a monthly illustrated magazine. It will be called "American Conservation." It will make its first appearance next month. The price will be two dollars a year, and already a large list of subscribers is announced.

Since conservation has become a great national issue, officers of the association say there has been a wide and insistent demand for a magazine covering the entire conservation field. The object of the new magazine, it is announced, will be to keep the thousands of individuals who are interested in the conservation movement informed as to the country's natural resources, what is being done with them, what ought to be done with them, and of conservation activities in general in America and other parts of the world.

The magazine is to be popular in style and profusely illustrated and will present articles by leaders of national reputation, eminent specialists and other well known writers, who will tell how specific conservation problems are being worked out practically in this and in other countries. It "will deal with the subjects within its field without prejudice or political bias."

Wolf Moneth.

JANUARY, the month with the Latin name, had a grimmer name in Saxon England. Richard Verstegan, in his "Restitution of Decayed Intelligence in Antiquities," a curious book published in 1673, writes: "The month which we now call 'January' our Saxon ancestors called 'wolf monat,' to wit, 'wolf moneth,' because people are wont always in that month to be in more danger to be devoured of wolves than in any season else of the year; for that, through the extremity of cold and snow, those ravenous creatures could not find other beasts sufficient to feed upon."—London Chronicle.

Drouth and Tagged Birds.

NEW YORK, Jan. 16.—*Editor Forest and Stream:* In FOREST AND STREAM for January 14th. I note on the editorial page the statement that the long drouth in the East has affected all vegetation, and reduced the winter food supply of the birds.

This is a point which I had previously overlooked, and shows the special need for feeding quail in winter. In the vicinity of my country place at Stamford, Conn., local records are said to show that we had more than ten inches shortage in rainfall in 1910, about eleven inches shortage for 1909, and about nine inches shortage for 1908, giving approximately thirty inches shortage for the three consecutive years. Many of the weeds which furnish food for quail in winter did not mature seed well, as I had occasion to observe while collecting seeds of weeds for purposes of sowing in a worn-out field. Quail would still have the buds of trees and shrubs to fall back on, and these buds would furnish a complete food supply for grouse and for pheasants, but I do not remember to have found a great number of buds in the crops of quail.

The food supply of fish has also been reduced in all probability by the drouth. In the streams the water was so low that in quiet places it froze entirely to the bottom, and ice still remains on the bottom where it has been now for considerably more than a month. This probably means the death of untold numbers of ephemera, crustaceans, mollusks and small fish, and it is a question if extensive stocking of streams would be desirable next spring, before the lesser life has had opportunity to multiply.

On the same page in FOREST AND STREAM I note the killing of a wild goose in Nebraska which bore a message from a prospector in Alaska. It occurs to me that we might learn much of the migration of waterfowl if summer travelers in the North were to take along tags of copper, bearing inscriptions, which could be fastened to young birds. It is not at all difficult to catch adult wild geese while they are moulting, and young ducks and geese are caught in numbers—forming in fact a good part of the regular food supply of travelers in the North. It would be no trouble at all to tag a number of these birds, noting the date and locality, the only problem in my mind being the point for attaching the tags. If the wires connected with the tags were placed about the leg or wing it is probable that the birds would keep pulling at them. If placed about the neck, growing birds might choke later. I have often put young geese in the canoe and kept them all day "for company," returning them to the parents at night. I could not kill them, because they would eat out of my hand and had a friendly attitude. ROBERT T. MORRIS.

[Dr. Morris' remarks on the stocking next year of streams which have been depleted of their fish life by the drouth of the last three years, deserve careful thought. People are very prone to imagine that because one year has been dry, the following one will be wet, but the experience in Connecticut and elsewhere in New England, shows that no dependence can be placed on this belief.

It will be recalled that a society devoted to the tagging of birds is already in existence. A notice of it was printed in FOREST AND STREAM, March 5, 1910. This society has expressed its willingness to supply at nominal cost bands to be attached to the feet of wild birds to anyone wishing to tag them. The only condition is that the bands should bear the association's serial number and the inscription "Notify the Auk, New York." While this effort to trace the movements of individual birds is as yet in its infancy, some interesting results have already been secured, especially in connection with a number of young night herons which were banded at a rookery at Cape Cod, some of which were later reported from three different New England States. The president of the American Bird Banding Association is Dr. Leon J. Cole, University of Wisconsin, Madison, Wis. Wires are not used in attaching tags to birds' legs.—EDITOR.]

Latham's Duck Shooting.

THE first detailed account which we have seen of the shooting of ducks from an aeroplane, by the French aviator, to which reference has been made in our columns, is published in the Breeder and Sportsman of California. The account is interesting in connection with our recent comments on the event:

"When Hubert Latham, the French aviator, sat down to dinner December 22d, wild duck was served as the honor dish of his menu. It was a little duck of the scaup species, and familiarly called bluebill by hunters of waterfowl. But it was an extraordinary honored duck in that it was the first ever shot from an aeroplane. Latham brought down the fright-driven bird with the first shot fired from his fast-flying Antoinette monoplane while going at the rate of fifty miles an hour at the Bolsa Chica Gun Club preserve at noon that day. The distinguished bluebill dropped into the ocean, fifty yards from the beach, but was carried ashore by a roaring surf, and picked up after a frenzied search by a score of men.

"Nothing quite so spectacular in the way of aerial exhibitions has ever been seen as Latham's shooting expedition on this occasion. He had talked of it for a week, but few took him seriously. However, he got permission from the Bolsa Chica Gun Club, an exclusive organization having 3,400 acres of the finest preserves in Southern California, to fly over and have a try at the game.

"Early in the day the dapper little Frenchman was on the aviation field at Dominguez, near Los Angeles, urging his mechanicians to hurry the preparations for the expedition. It lacked half an hour to noon, however, before the big monoplane was ready, and Latham took his seat for a few turns on the field. Satisfied that everything was ready for his flight across country to the gun club, he came down at his hangar and asked for his gun. A 20-gauge shotgun, a light type of fowling piece, was brought out and Latham swung it over his shoulder by a strap.

"It was just a quarter to the noon hour when Latham gave the word and the motor was put into motion. Rising quickly, the big machine soared east for two miles and then turned southeast along the ocean shore.

"It was fifteen miles from the aviation field to the gun club, and it was just on the stroke of noon that the gun club members and their guests caught sight of the dragon-shaped monoplane. Two minutes later he came whirring over the power-house that marks the boundaries of the club's game preserves and headed straight down the long lagoon. He had made the trip from the aviation field in almost a mile-a-minute speed.

"As he dipped over the power-house and swooped above the thousands of waterfowl in the lagoon there was utter consternation among the birds. They arose in swarms.

"Latham flew straight over the lagoon for half a mile, 200 feet above the water, veered suddenly oceanward, and headed straight for a big flock of terror-stricken ducks. A few hundred yards from the shore he took his first shot. A bluebill fluttered and fell straight down into the ocean and was afterward picked up on shore.

"The monoplane followed the flock of ducks for two miles to sea. They then wheeled shoreward and Latham followed. The ducks, however, were quicker on the turn, and whenever Latham would come near enough for a shot they would change their course.

"The chase lasted fifteen minutes. Up and down the coast and around in circles the frightened fowl flew, not knowing which way to turn to avoid the monster that pursued them. Latham was handicapped in his shooting, because the huge blades of the propeller of his Antoinette are directly in front of his seat, and he was obliged to turn half way around or get beneath the ducks before he could use his gun.

"Whenever he would gain on the flock they would rise high above him, and wheel around and start for shore.

"Finally the flock that had amused Latham for fifteen minutes made straight for the sea and the little Frenchman turned his attention to the marshes. In thousands the fowl flew quacking loud notes of alarm around the aeroplane and Latham began to shoot. He was not more than 200 feet above the marsh at any time, but so far as he knows he did not kill another duck in the dozen shots fired, although he believed he crippled several. He had great fun chasing the ducks that were so frightened that they flew round and round in circles.

"Latham finally descended in the yard of the clubhouse and stepped out to be greeted by the members and escorted to luncheon."

Book Exchange.

AMONG the readers of FOREST AND STREAM there are many who are interested in old out-of-print and rare books on sport, travel, exploration and kindred subjects, and frequent letters are received at the office ordering such books.

In the very nature of the case, however, these cannot be supplied on order, and it often takes months of search to secure copies, by which time the person who ordered them may have forgotten all about the matter. Within a few weeks we have received from readers and from dealers a dozen orders for a supposed book called "A Boy in Indian Camps," which orders were called forth by an article printed not long ago in FOREST AND STREAM, describing a book published in 1850 and long out of print. Such books as Dodge's "Plains of the Great West,"

"Hunting Grounds of the West," Elliott's "Carolina Sports," Palliser's little book on Western hunting and others are often sought for.

These volumes and others like them contain a world of vivid interesting description of life in the open, as it was from forty to sixty years ago, and furnish the most delightful reading. On the other hand, because they are scarce, they are costly by comparison with the ordinary outdoor book, which has just been published and stands in numbers on the shelves of the book seller.

No doubt there are many of our readers who possess these old books, and others who would be glad to possess them, and we are, therefore, making a special place in our advertising columns, which may be called a book exchange, where those who wish to purchase, sell or exchange second hand books may ask for what they need, or offer what they have.

History of the Boone and Crockett Club.

THE Forest and Stream Publishing Company has recently issued a little book of much interest to big-game hunters and lovers of natural things. It deals with the history of the Boone and Crockett Club from the time its formation was suggested in the year 1887 to the present time.

Beginning with an account of the purposes of the club at its inception, it traces the changes which have taken place in the United States within the last twenty-five years, and shows how the club, originally organized as an association of hunting riflemen, has been obliged to change its purposes and to devote itself to the preservation in this country of the game and the forests.

Among the achievements claimed for the club are the carrying on to a successful end the fight for the preservation of the Yellowstone National Park, the establishment of the present forest reserve system of the United States, the founding of the New York Zoological Society, the passage of a bill by the New York Legislature forbidding the hunting of deer with dogs, the enactment of a game law for Alaska, the game refuge idea, the establishment of the Glacier National Park and the establishment of big reserves in Canada.

Much of the early history of these movements has already been forgotten by the general public, and it is very satisfactory that many details connected with these matters have now been set down in orderly fashion, and so are readily accessible.

Explorers' Club Annual Dinner.

THE seventh annual dinner of the Explorers' Club was held Saturday, Jan. 21, at the Salmagundi Club, New York.

In the absence of Captain Peary, the club's president, Frank M. Chapman, of the American Museum of Natural History, presided. The attendance of members and their guests was large. Among those present were: W. J. McGee, the ethnologist; Dr. H. C. Bumpus, Prof. H. C. Parker, Messrs. Brown and Kountz, of Mt. McKinley fame; Hon. George Shiras, 3d, Louis Agassiz Fuertes, Stansbury Hagar, Dr. Charles H. Townsend, director of the Aquarium; Charles Sheldon, the Alaska explorer; Mr. Clark, F. S. Dellenbaugh, Prof. Crandon and C. F. Ober.

After the dinner was over, Mr. Shiras spoke at length of his work in photographing wild birds and animals, and showed a lot of marvelous pictures of deer, moose, elk, raccoons and his famous albino porcupine.

Prof. Crandon talked most interestingly of his travels through the South Sea Islands, showed a multitude of beautiful photographs of places, people and the interior of volcanoes, and gave on the phonograph a number of native songs.

Mr. Clark showed many moving pictures of African travel, including a number of the safari of Colonel Roosevelt.

Mr. Fuertes, who was introduced as Paul B. Du Chaillu, amused his audience by repeating the story told long ago by Mr. Du Chaillu of the killing of his first gorilla. He also gave a most amusing negro dialect story.

SEA AND RIVER FISHING

An Early Trip With Bait.

Concluded from page 100.

AFTER luncheon it was decided to leave the rough East Branch. The bay team was in fine fettle; the rain had stopped for a short time, and the ride down to the village was pleasant. In the Little Sock the Young Angler landed on the broad shelving rock from which he was fishing a heavy fifteen-inch trout. It was a beauty, very light in all of its coloring, a trout that had lived in open sunny water. Just above the bridge in Uncle Jim's water a flat rock lay partly submerged near the middle of the stream. The Young Angler pulled his minnow along the further side of this rock. At the second cast a trout had it and was running away with it so fast that the Young Angler had difficulty in giving it line. In the midst of the fight Uncle Jim appeared. After some light teasing of the Young Angler for poaching and duly admiring the two big trout, Uncle Jim resumed his fishing with the Young Angler looking on. What a bait-fisherman Uncle Jim was! He used no reel, but fished with a line a yard longer than his rod. The minnow was cast to just the right spot and made to spin in a manner that the Young Angler was never able to imitate. He kept his minnow whirling near the surface, for he liked to see the trout strike. He seemed to know instinctively in what part of the pool or the riffle trout would lie, and he never frightened them by getting too near or missed them by not fishing where they were. His fifty years of experience had given him such knowledge and skill that even the native angler who lived among trout streams looked up to him as a master of the art of angling for trout with bait.

That evening Jake, who was as a rule the taciturn member of the nightly gathering around the big wood stove, grew voluble over his afternoon's fishing. He had gone down the main stream a mile or more to a pool that was locally known as the Peddler's Hole, and here he had made something of a killing. This pool is narrow and deep at the upper end where the heavy current flows into it along a rocky cliff. Then the water quickly broadens out into a wide slowly moving mass that gradually grows shallower and moves more and more quickly. Because of its size, smooth bottom and exposure to the sun and big eddy, it had always been a famous place for trout. Jake, who never hesitated to go into four feet of water, if necessary to reach his trout, waded out as far as possible, cast his minnow over into the black current along the base of the cliff and then followed it slowly. Minnows had not been abundant during the winter, and when a trout got hold of one, it never let go. When Jake felt a tug, he would tighten up his line, wait what would seem an interminable period to ordinary mortals, then hook his fish and start towing it to shore. All of the trout were heavy and strong. Once he got an unusually wicked jerk and he could feel the fish giving heavy tugs at short intervals like a bulldog pulling at a rope. This fish, fighting every inch of the way, he led almost the full length of the pool before he attempted to beach it. A less phlegmatic fisherman than Jake would have given voice to some exclamation when he had landed this old monarch, but Jake calmly killed and cleaned and stowed it in his creel in such a way as to show to best advantage its enormous size. But after supper, while smoking his pipe, the excitement that was bottled up in him began to come out, and he related the afternoon's experience in a way that made him for once the chief speaker of the evening.

To fish the Little Sock and its tributaries was the next day's program. The Young Angler decided to take it easy and enjoy the day in spite of the damp and cold. Under a tree that the stream had undermined he found two plump trout. Then in a rocky pool, while a farmer's boy watched him over the fence, he hooked and landed a fifteen-inch trout that made a strong fight. In another shallow pool where the stream ran through an abandoned mill pond he succeeded in landing one of the handsomest fish of the trip. Late in the afternoon he decided to go around Uncle Jim and fish again the pools between the Bridge and the mouth of the Little Sock. While he was on the way down, the clouds began to roll away and reveal more and more blue sky until finally the sun again burst

through for good and filled the Young Angler's whole world with glory.

At his favorite pool below the bridge he found a small boy from the village fishing from the flat rock for chubs. Fishing the lower part of the pool, the Young Angler hooked and landed four trout, each weighing more than a pound. In the lower end of the pool where the water was deeper he hooked a very heavy fish which he played with much care until he saw a big fin appear on the surface and knew he had a tremendous chub. This was hauled out without ceremony and presented to the small boy, who started home on a run. A fish or two was picked up in the pools below, and then the Young Angler went back to the bridge to wait for Uncle Jim and Jake. They had well filled baskets, but the Young Angler had this day beaten both for size. Jake swore by a round oath that he had hooked something in a deep pool on Bird's Creek that was either a root that swung back and forth in the current or the biggest trout he had ever hooked. One minute he thought it was a root and the next minute he concluded that it was a trout, and he argued himself into a very uncomfortable frame of mind over it.

That evening Uncle Jim stirred Jake up again by telling him of the largest trout that had ever been seen in that section. He and some friends had been fishing the same water that the present party were fishing, but in harvest time. Below a small dam across the Little Sock, from among the roots of a big butternut tree that leaned over the water, there poured a large stream of cold water, and into this water the trout crowded when the weather grew warm. Late in the morning Uncle Jim had gone up to this place and saw among the other trout one that he always declared was twenty-eight inches long and would weigh seven pounds. The first time he pulled his minnow through the water below the dam the big trout grabbed it, and he succeeded in pulling it up on to the sheeting of the dam where he held it until its flopping broke his line.

Bill Wood, said Uncle Jim, had been cleaning his trout under a bridge, and as Bill cleaned a trout and laid it behind him, a mink slipped out from among the stones of the abutment and carried it off. When Bill was through, the only trout he had was the last one he had cleaned. John Green, fishing late in the evening under the covered bridge at the head of the dam, had two bats take his flies at the same time while the flies were behind him in the air. Still Jake declared that if it were a root it acted very much like a fish, and if it were a fish it must be the one that escaped from Uncle Jim under the dam and had grown to the size of a shark.

At dawn the party were on their way home with the large basket packed with nearly 200 trout in ice and sawdust. At the great splash dam, with its wolf trap gates that backed up two miles of water, the men were just turning on the flood that would lift the logs lying on shallow bars of the creek more than twenty miles below. At the mouth of Salt Run, after luncheon, the remaining minnows were divided. The stream that was so swollen and wild on the first day, and that had scared away all other anglers, had fallen and was nearly clear. Not a trout had been taken from it during the week. The Young Angler fished deliberately. From a small pool he led in prompt succession four trout averaging nearly a foot in length, and from each of the deep pools in the woods he got one and sometimes two good fish and at 4 o'clock he and Jake reached the wagon with a fine catch. Wallis Run was Uncle Jim's favorite stamping ground, and when the wagon came round the turn, the occupants saw that Uncle Jim was landing a trout that he handled with the care he usually gave to a big one. When he saw them he waved his hat. He had only a half dozen trout, but each one was a beauty and would have made any day's trout fishing worth remembering.

Two miles below the mouth of the run the party came in sight of the log drive. The flood let loose so many hours before was just passing and the creek presented a sight of wonderful activity. The great ark in which half a hundred men ate and slept, with its smoking stove pipe projecting from the roof, was floating slowly down in mid stream. On the shallows a dozen teams and forty men were hauling and rolling logs into the channel, and the big Kennebecker, loaded with logmen and poled by a brawny woodsman, was crossing from one side of the creek to the other. It was the last big drive on Middle Creek.

When the fish were divided, the Young Angler as usual was made to take the lion's share of the big trout, but when they were exhibited in the window of a sportsmen's goods store that evening in his home city, his pride received a fall when he heard an old angler in the crowd around the window say to one who had been told that they belonged to the Young Angler, "Oh, I guess all the big ones was ketched by Uncle Jim." CHARLES LOSE.

"Well, Sir! Once—."

IV.

"WELL, sir, once I saw a man defeated in a bout with a fish, and all because he would not listen to advice," said a narrator. "Crowd of us were fishing on the east coast, near an inlet, and whenever we wanted to have a little excitement, would go after shark. When the tide was running in the big ones would follow the fish and we would tie a line to a stake, carry the bait out into deep water in a boat, drop it and go back to the beach to wait for a strike. The shark generally hooked itself, and after it was nearly tired out, we would man the rope and haul it out on the beach. A nice young Englishman was at the hotel, and we soon included him in one of our shark-fishing parties. He was traveling around seeing the country, and as it was his first visit, everyone had been having fun with him. He had started in by believing all that was told him, and had about gotten to the stage of believing nothing. He was an arrant and confirmed skeptic. He was enthusiastic and took great interest in the setting out of the shark line, but did not approve of its being left without an attendant.

"'Who is to mind the line?' he inquired, as we all started back up to a bit of shelter we had rigged.

"'Mind itself.'" said one of the boys. 'It's self-acting.'

"'Fawncy,' replied the Englishman, with a smile. 'But I say, who is to mind the line and hook the fish if we get a strike?'

"We explained that sharks were savage biters, generally hooking themselves, and that when they ran out the line until the slack was gone, the stake would snub and set the hook deep and fast. I think this looked almost reasonable enough for him to accept, but we made the mistake of adding that it was unsafe for a man to be on the line when a shark struck, as they were so heavy and strong that a man could not handle one at all. He looked us all over, and apparently our very seriousness made him think it was another game put up on him. 'I think I'll mind the line,' said he, turning and walking back. 'You see, I am very anxious to get a good view of one of those fish.'

"Going to the stake, he picked up the first coil of slack, and taking a turn with it about his wrist, settled his feet firmly in the sand.

"'Now, what do you think of that?' said one of the fellows.

"'Think he has got to come off that job blamed quick,' was the reply. 'He will get his neck broken if he don't.'

"For the next ten minutes we took turns trying to persuade him to leave the line, but all in vain. He seemed convinced that we were trying to josh him, and wanted us to fully realize that he was on. He had learned our ways at last. After exhausting our powers of persuasion we concluded that all we could do was to sit tight and hope for the best, in the shape of a small fish for the first. By suggesting the wisdom of having free line to allow the fish to take the bait without feeling the hook, I had persuaded him to remove the turn from around his wrist, for which I was truly thankful, for with the line free I did not fear anything more serious than burned hands. We had not waited long, when the strike came. We saw the line straighten out slowly, and just as we sprang up the fisherman gave it a vicious tug. He was a husky chap, and must have set the hook good and firm. There was a pause, and the man braced himself and tightened his grip on the line. Then there was a snap, the spray flew from the vibrating line, and the man shot with a beautifully flat trajectory straight for the water. It was twenty-five feet from where he stood, and he touched the sand only once, cutting a deep groove with his face before going in.

"We rushed in and pulled him out. He was unconscious; his eyes, nose and mouth full of sand, and he was full of salt water before we got him out, so we were at a loss what to treat him for. We worked on the sand first, and while we were at it, he revived. Getting rid of a quantity of water and more sand, he weakly inquired what had happened. When we told him and showed the shark line snapped off within a foot of the stake, it never having checked the brute, he seemed dazed. 'And I was the bonnie laddie that was going to catch the little fish for you gentlemen. Fawncy; I humbly beg your pardon for being such an ass. I thought you were pifflin me.'" LEWIS HOPKINS.

A Cannie Scottie.

A SMALL Scotch boy was playing on the sands at the seaside with some small crabs. One of the crabs came sidling toward the boy's bare toes, and he retreated. As it approached, his big brother, who was watching, said: "You're feart, Robert." Upon which Robert replied: "I'm no feart. I'm learnin' it to follow me."—Baby's World.

The Harmless Angler.

OMAHA, Neb. Jan. 12.—*Editor Forest and Stream:* An Omaha reader of FOREST AND STREAM wants to know whether it is possible for an ordinary angler to be a real Christian. He says the query ran through his mind while reading a bass-catching story in a recent issue of FOREST AND STREAM, and he could not refrain from asking me, one of your contributors. "The tendency of a fisherman," he adds, "is to exaggerate. To most of them a comparative minnow becomes a huge fish, and the average bass is little less than a whale. Even those most scrupulous in the ordinary walks of life, when they capture a fish weighing six pounds and seven ounces, are apt to let their consciences stretch enough to cover the odd nine ounces and call the fish a seven-pounder.

"Now, what is the reason of this almost universal prevalence of magnification in the stories of fishermen when it is so seldom to be met with in the other branches of recreation affected by sportsmen? Who ever heard of a follower of Nimrod on his return from a hunt, relating to his friends that he had killed three squirrels, each as large as the side of a church, or bagged a quail measuring eight feet from tip to tip of its wings? Or who ever heard of a canoeist standing in the midst of an admiring throng of neighbors, declaring that he had paddled eighteen miles an hour up stream and against a heavy head wind in a boat of a certain pattern? And yet this is just what we have to stand in the way of gutta percha tales from our fishermen, young and old. Is there an undiscovered principle in hooks and lines, and rods and reels and flies that leads their owner's tongue into ways that are dark? Or does some peculiar odor invest the finny tribe which, being absorbed by the fisherman, renders him for the time being oblivious to all considerations of truthfulness so far as the number and weight of his fish are concerned? Scientists should examine into this matter, and report for the benefit of a suffering people."

Well, we don't see why a fisherman cannot be a Christian. Would you tie the soaring spirit of the angler who sits on a stump all day and never gets a bite by the rules which govern Nimrod, whose active body, heated by the chase, depresses his imagination? Would you bring the fisherman's poetic soul down to the level of steelyards and measuring tapes?

The angler scorns such materialistic things as he does the mechanical measuring of his mountains, and the estimating of the quantity of water which falls over his favorite cascade. What plain, practical people prefer to consider prevarication, is to the angler merely a recognized poetical license, and his enthusiasm is too great to coldly calculate by tables of weights and measures like groveling scientists and gropers after facts. He believes his stories thoroughly, and they do not harm his fellowman who, not thoroughly imbued with his spirit, smiles at his enthusiasm. Angling is the only sport that does not pall upon a man as he grows older. It is one of which he never tires. The aged angler is more enthusiastic than the younger one, and its quiet, soothing influences, interrupted by the sudden excitement of hooking a large fish, makes him keenly alive to impressions which may, like a poetic vision, be magnified in its relating. The poet's eye, in a fine frenzy rolling, magnifies hills to mountains, and a waterfall to a cataract, yet none complain of him.

This is the only answer I can make to my correspondent. We hear enlarged stories, and always allow for the personality of the catcher of great fishes. He is so entirely harmless and derives so much consolation from the narration of his exploits that it were a sin to compel him to carry weights and measures, and then ask him to step up to a notary and certify to his statements.

SANDY GRISWOLD.

Things That Are Caesar's.

TUPELO, Miss., Jan. 19.—*Editor Forest and Stream:* George Dawson, who in days gone by was so prominent in political affairs, and so well known as the proprietor and editor of the Albany Evening Journal, was also one of the "old guard" of fly-fishers, and at odd times discoursed through his paper in a delightful and masterly manner on the charms of angling. He it was who originated the expression: "It is not all of fishing to fish." I noticed in FOREST AND STREAM of Jan. 7 that Grizzly King, who is always so reliable from his perch on the top rail, attributed the phrase to the late and lamented A. Nelson Cheney, and no wonder, as my friend Cheney was very fond of the aphorism, and used it so often that many others as well as Grizzly King believed that he was its author.

JAMES A. HENSHALL.

C. H. HIGBY'S BROOK TROUT ANGLER.
From the menu card of the Anglers' Club of New York.

Commissioner Bowers' Report.

IN the annual report of the Hon. George M. Bowers, Commissioner of Fisheries, to the Secretary of Commerce and Labor, he says it is gratifying to be able to record another successful year in fish cultural work. Methods have not varied appreciably from those of former years, and attention has been directed principally to enlarging the output.

The widespread and increasing interest taken in the bureau's work by people in all sections of the country and the growing conception of the benefits resulting from the stocking of public and private waters are manifested by the large number of applications for fish received during the year, the number being 10,635, an increase of 523 over 1909.

Work was conducted at thirty-five permanent stations and eighty-six field and collecting stations, located in thirty-two States. With reference to the fishes propagated, the regular hatcheries may be classified as follows: Marine species, 3; river fishes of the Eastern seaboard, 5; fishes of the Pacific coast, 5; fishes of the Great Lakes, 7; fishes of the interior, 15.

The results of fish culture depend largely upon climatic conditions, the most elaborate and carefully executed plans ending in success or failure according to the state of the weather in the spawning season. In 1910 these conditions were generally unfavorable, resulting in the curtailment of egg collections of most of the important species, but owing to the superior quality of the majority of the eggs obtained, the Bureau was able to exceed its record year of 1909 by 126,800,000, or 4 per cent., the total output of fish and eggs being in excess of 3,233,000,000. This was accomplished without increased funds, the available appropriations being the same as in the preceding two years, and was made possible largely through the faithful and efficient service rendered by the Bureau's employes in their several lines of work.

The following is a table summarizing the distribution of fish and fish eggs for the year. Of these, 443,177,000 eggs and 7,425 fish were delivered to various State fish commissions, and 600,000 eggs of salmon and trout were shipped to foreign countries.

SUMMARY OF DISTRIBUTION OF FISH AND EGGS, FISCAL YEAR ENDED JUNE 30, 1910.

Species.	Total.
Catfish	544,350
Carp	22,710
Buffalofish	201,475
Shad	92,236,000
Whitefish	251,392,000
Lake herring	71,740,000
Silver salmon	11,293,025
Chinook salmon	53,941,498
Blueback salmon	142,956,595
Steelhead trout	3,900,005
Humpback salmon	1,368,000
Rainbow trout	2,860,338
Atlantic salmon	1,460,578
Landlocked salmon	1,404,404
Blackspotted trout	5,398,538
Loch Leven trout	68,248
Lake trout	48,145,772
Brook trout	12,150,006
Sunapee trout	171,029
Grayling	106,018
Pike	43,300
Pickerel	500
Crappie and strawberry bass	414,477
Rock bass	69,985
Warmouth bass	792
Smallmouth black bass	650,905
Largemouth black bass	736,082

Sunfish (bream)	345,635
Pike perch	476,484,760
Yellow perch	332,194,245
Striped bass	7,350,000
White bass	6,050
White perch	354,980,000
Yellow bass	250
Sea bass	808,000
Smelt	4,509,000
Mackerel	764,000
Freshwater drum	11,950
Cod	220,208,000
Pollock	38,140,000
Haddock	712,000
Flatfish	930,755,000
Lobster	163,297,052
Total	3,233,392,572

The conspicuous increases in the output of fish and eggs over the year 1909 were in blueback, silver and Atlantic salmon, lake trout, lake herring, yellow perch, shad, cod, flatfish and steelhead trout, the production of the latter three species exceeding all previous records.

There was a slight decrease from last year in the number of chinook salmon liberated from the Pacific coast stations.

In view of the steady decline in the shad fishery in rivers tributary to the Atlantic for the past fifteen years, it is gratifying to be able to record an increased egg collection of this species and a corresponding increase in the output of fry. The results are attributed partly to recently enacted legislation regulating the methods of fishing in the Albemarle Sound and partly to an exceedingly early spring, which started the run of fish in the Potomac River before the pound nets could be equipped, each factor permitting a larger number of fish than usual to ascend to the spawning grounds.

As in previous years most of the brook trout eggs handled at the fisheries stations are purchased from dealers, this course having proved more economical in most sections of the country than reliance upon collections from waters available for the purpose. At present only two stations—one in New England and one in Colorado—obtain their supplies of eggs from wild fish, and the fields heretofore open to them are narrowing each year because of the encroachments of commercial fish culturists. In 1910 Wellington Lake and the Grand Mesa Lakes, heretofore the most productive sources of the Colorado station for eggs of the black-spotted brook and rainbow trout had to be given up to private enterprise.

Investigation of the streams in Yellowstone Park demonstrates the possibility of greatly extending operations with the black-spotted trout, and it is intended to increase the force of experienced men in this field with the view of making it a source of supply for the Leadville, Spearfish and Bozeman stations. The work in the park during the past season was entirely satisfactory.

Taken as a whole the output of the basses, sunfish and catfish from stations in various parts of the country was good, the improved results being largely due to increased knowledge of the factors governing the successful propagation of these species. The production of pond stations was supplemented by the collections on the Mississippi and Illinois rivers, where, in addition to securing sufficient bass and allied species for restocking many depleted waters, large numbers of other fishes were seined from shallow sloughs formed by the floods and returned to the main streams. If not removed, the fish would perish from drouth or cold, and their rescue conserves a valuable local food resource. A new station established at Helena, Ark., late in the summer rescued over half a million fish.

With the view of extending rescue operations

(*Continued on page* 156.)

Some News and a Little Gossip.

Capt. Charles Barr, the most successful skipper on this side of the Atlantic, died last Tuesday. The news of his death was a shock to all who knew him, and he will be missed, not only by those who have watched him handle yachts or those for whom he acted as master, but by those, too, who worked for him. He was always considerate for his men, and they would always work heartily for him, because of the regard they had for him. He was a modest, retiring man, able, recourseful, daring and an indefatigable worker. He leaves a vacancy at the head of the list of racing skippers which will be hard to fill.

Henry F. Lippitt has been elected as United States Senator from Rhode Island, to succeed Senator Aldrich. Mr. Lippitt has long been a most enthusiastic yachtsman. He now owns the 65-foot sloop Winsome, as well as a large motor boat on which he lives and cruises. Among yachts he has owned and raced are Wasp and Quisetta, and he has raced them most successfully. His yachting friends congratulate him on his honors, and they will rely on him looking after the interests of yachtsmen in Congress. Many laws have been passed which do not really benefit yachting and which do not accomplish the purpose for which they have been adopted, but with Mr. Lippitt in Washington, yachtsmen will feel that they have a friend at court and one who thoroughly understands yachting, navigation and what laws are required to minimize the chances of loss of life at sea and prevent disasters and accidents.

Hollis Burgess, of Boston, returned from Bermuda last Monday. He made a trip to the lily island to consult with the yachtsmen there about the coming race for sailing craft from Boston to Bermuda. This race is to be started from off Rowe's Wharf on Saturday, June 4, and the Boston Y. C. is doing everything possible to make it a success. Mr. Burgess says the Bermuda men are very keen over the race, and that they will probably be represented in the contest by one or two yachts which they will send here early in May. There are now four yachts, according to Mr. Burgess, entered: H. S. Vanderbilt's Vagrant, winner last year; Demarest Lloyd's Seneca; R. S. Runk's Margaret, winner in 1909, and Commodore Douglass' Shiyessa. These four alone should make a fine race, but others are expected to be entered between now and the time of closing the entries.

At the first general meeting of the New York Y. C., Secretary Cormack reported that there were now 2,380 members of the club. The members voted to present Arthur Curtiss James, who was Commodore in 1909-10, with a suitable cup in appreciation of his services to the club when he was flag officer.

More club elections were held last week. The Knickerbocker Y. C. members dined together and elected officers as follows: Commodore, Louis H. Zooher; Vice-Commodore, Charles P. Loeser; Rear-Commodore, Dr. W. E. Spencer; Treasurer, George H. Cooper; Secretary, J. O. Sinkinson; Measurer, George J. Stelz; Fleet Surgeon, E. D. Rudderow, M.D.; Board of Directors—Rodman Sands, Harry Stephenson, Walter B. Beam, Alfred Schoen and Frederick L. Kraemer.

The Bryan River Y. C., at its meeting held at Portchester, N. Y., elected these officers: Commodore, Joseph T. Hubbard; Vice-Commodore, Clifford Flint; Rear-Commodore, J. H. Fletcher; Fleet Captain, H. J. Roundy; Secretary-Treasurer, Carl R. Roundy; Fleet Surgeon, Dr. John J. Lewin; Trustees for two years—Harold A. Conant and Dr. Brooks.

The Orient Point Y. C. members met at the club house, Mamaroneck, last week and elected the following officers: Commodore, Joseph P. Meagher; Vice-Commodore, Arthur L. Snow; Treasurer, William J. Kuder; Secretary, Dr. H. K. Miller; Trustees for two years—Putnam H. Acres; for three years, Daniel Warren; for one year, Rev. Frank F. German.

The annual meeting and dinner of the New Rochelle Y. C. will be held on Feb. 4 at the Hotel Manhattan. The Nominating Committee has proposed the following candidates to serve for the ensuing year: Commodore, E. C. Myrick, sloop Lady M.; Vice-Commodore, S. C. Hunter, sloop Juanita; Rear-Commodore, C. A. McGill, power boat Apache II.; Secretary, C. A. Marshland; Treasurer, C. E. Salter; Measurer, R. M. Haddock; Trustees—A. H. Titus, A. P. Bennett, L. R. Smith;; Regatta Committee—G. P. Granbery, A. E. Eldredge, M. S. Kattenhorn; Law Committee—J. F. Lambden (chairman), C. W. Voltz; Art Committee—Henry M. Lloyd (chairman), Henry Doscher; Entertainment Committee—E. R. Leacraft (chairman), William J. Clark; Nominating Committee—M. W. Houck (chairman), F. W. Isenbarth, H. J. Meyer.

The Cleveland Y. C.'s annual meeting, the thirty-fifth in the history of the club, was held recently and the reports showed that it was in a most flourishing condition. O. P. de Mooy's Red Devil was announced as the winner of the class A series and J. C. Jurgen's yacht of the class B series. The new officers are: Commodore, George H. Worthington; Vice-Commodore, William J. Bennet; Rear-Commodore, Charles H. Estinghausen; Secretary-Treasurer, Vance A. Hives; Directors (to serve three years)—George H. Worthington, F. W. Roberts, J. S. Malone; Measurer, Arthur C. Treiber; Assistant Measurer, Jac Koerner; Surveyor, E. L. De Mooy; Surgeon, Dr. E. W.

Curley; House Committee—Charles H. Estinghausen, William Boehmke, F. G. Overbeke; Regatta Committee—J. C. Bishop, William B. Alexander and James L. Mahon; Power Boat Committee—F. G. Overbeke and Otto Nehrenst; Auditing Committee—F. G. Overbeke, P. E. Hintz and Arthur C. Treiber; Entertainment Committee—Vance A. Hines and James L. Mahon; Membership Committee—William Boehmke, H. L. Chandler, J. H. Seymour, A. Treiber, O. P. De Mars, E. L. De Mooy, Dr. E. W. Burley, P. E. Hintz, E. H. Croft and Otto Nehrenst.

At the annual meeting of the New Haven Y. C. the plans for the new club house at the Cove were talked over at great length, but nothing definite was done about setting a date for the completion of the building. The secretary announced that some portion of the necessary $15,000 of the holding company bonds had been subscribed, but not half of the amount needed. It was voted not to purchase the present house, which will probably be rented for part of the coming season until the new house, if started, can be completed.

The following officers were elected: Commodore, William S. Pardee; Vice-Commodore, W. W. Price; Rear-Commodore, Otto G. Ramsay; Secretary, Harry B. Ekmark; Treasurer, Willian D. Scranton; Trustees—Frederick Brewster and R. P. Taylor; Racing Committee—G. Edward Osborn, C. E. Skinner, R. J. Ferguson, Norman Gillette and Frank H. Mason; Measurer, Edward E. Crampton.

The annual meeting of the American Y. C., of Newburyport, was held last week and the following officers were elected: Commodore, John H. Wheeler; Vice-Commodore, George W. Marquand; Rear-Commodore, Edward A. Moseley; Secretary and Treasurer, Edward Jacoby; Measurer, A. S. Dyer; Collector, G. A. Johnson; Executive Committee—H. W. Little, Charles Lundberg, Herbert S. Noyes, J. H. Johnson; Regatta Committee—George W. McKay, George W. Marquand, Charles A. Safford, Charles S. Lundber and David P. Page.

Admiral Montagu's Stories.

ADMIRAL, the Hon. Victor A. Montagu is one of the best known of the British yachtsmen, and not only does he pay attention to yachting, but he is a fisherman, good shot and hard rider to hounds. While in the navy he saw active service in the Baltic in 1854, in China in 1857 and in the Indian Mutiny, 1857-8. He retired in 1886. As a yachtsman he has been very prominent in the sport, having owned and raced Corsair in 1892, Vendetta in 1893, and then Carina.

Admiral Montagu has recently published "Reminiscences," and in this work tells some admirable stories.

Speaking, for instance, of his grandfather, Waterloo Marquis of Anglesey, there is the following amusing anecdote: "When I and my brothers were still children," he writes, "I recollect our being sent for on several occasions to my grandfather's dressing-room. Here we would find him sitting in his bath, and he used to frighten the very life out of us by pointing his stump of a leg at us, and the more we yelled the oftener would he repeat this joke." Further on, in a chapter devoted to yachting, there is another tale of a tub equally amusing in its way, and perhaps of more interest to our readers. It was at Kiel. "I was having my bath at about 7 A. M.; some one shouted to me down the hatchway that the Emperor was coming alongside in his gig. What was I to do, naked as I was? 'Come up at once, Montagu,' shouted his Majesty; 'I want to give you your instructions.' 'But I am naked, your Majesty.' 'Never mind that; come up!' Luckily my bath-towel was of a large caliber, so I poked my head and shoulders up the hatchway. 'You look like old Nero in that get-up!' smilingly remarked his Majesty as he proceeded to give me verbal instructions for the day's racing."

He writes proudly of his two Queen's cups, one won with Corsair, the other with Carina. Of the German Emperor there is another amusing story. "I had a curious adventure on one occasion at Cowes," he says, "during regatta week. We had just finished a race, and had got hold of our moorings, and were going through all the performances of stowing sails, etc. Usually at such times, after a long, fagging day, one is able to enjoy a well-earned repose, a cup of tea, and a pipe, and to yarn with one's companions over the details of the race. Suddenly I heard a voice announcing through the skylight that a boat from the royal yacht was coming alongside. The German Emperor was then on board his yacht, the Hohenzollern, in the harbor, the Prince of Wales was on the Osborne, and her Majesty Queen Victoria was at Osborn House. It was nearly 7 P. M. when I was handed a huge sealed envelope, from which I extracted a letter telling me that the Comptroller of the Household was commanded by her Majesty the Queen to invite me to dine at Osborne at 8:30 that same evening. No sooner had the royal yacht boat shoved off that there appeared another and a similar craft. This came from the Emperor's yacht Hohenzollern, and bore another huge envelope addressed to me. On breaking the massive seal —why a German seal is always so large that it covers nearly one side of an envelope I never could fathom—I found, to my consternation, that I was invited to dine with the German Emperor on the same day and at the same hour!

"Reader, put yourself into my flannels and jedsey for a moment—tired, covered with salt-water, a humble creature, a mere nobody embarrassed with double honors, and not having the slightest idea which command I was to obey on such a momentous occasion! I always went to Cowes in those days, luckily for me, armed with the necessary clothing—breeches for Osborne and full dress for foreign entertainments. But to decide which honored invitation I was to accept passed the wit of this man. The hour of 7 P. M. had already struck, so that there was no time left to pause or think. Such a journey to Osborne from a yacht lying in the roadstead, picking up one's kit from a locker at the club en route, occupies a considerable period of time.

"'Skipper,' I called out, 'is there anybody on board who can semaphore to the royal yacht? If so, tell him to signal to the equerry-in-waiting to place my dilemma before the Prince of Wales, and ask him which command I am to obey.'

"The signal came back that the Prince was not on board, and was not expected till 7:30 at the earliest; nor was there anybody on board who could supply the necessary information.

"There was nothing to be done but to await his Royal Highness's return with such patience as I could command, and with the thought ever present in my mind of the long journey in a fly through the crowded streets, across the dreaded floating bridge, that is never on the side where it is needed, up that long steep hill to Osborne House, which can only be ascended at a walking pace. At 7:15 there was still no news, but a quarter of an hour later, when I had almost given up hope, a signal came from the Prince of Wales, saying that I was to obey my Sovereign's command to dinner, and to appear on board the Hohenzollern afterward in full dress.

"I was soon off ashore to the club, where I did not take long to don tights and long stockings, and, accompanied by my full-dress tin case, made the best of my way to Osborne in a fly, after promising double fare to the driver if I arrived at the Castle in time for dinner.

"Any one who knows Cowes in the height of the regatta week must be well aware that the streets at eight o'clock at night are densely crowded and almost impassable. That we drove over somebody or something I felt certain, as there were constant bumps; but, at any rate, I was not stopped, though just as we were approaching the floating-bridge the bell sounded for its departure. 'Hi! hi!' I yelled at the top of my voice; 'hold hard a second! I have an important despatch for Osborne! Luckily my ruse was successful, and, as luck would have it, I arrived at the Castle only five minutes late, to learn with relief that the Queen did not sit down to dinner until a quarter to nine.

"When dinner was over, her Majesty, who had, I supposed, been apprised of my invitation to the Emperor's dinner-table, spoke a few kind words to me in her accustomed charming manner. 'And now you must be off to the Emperor,' she said, 'or you will be very late.' I hastily departed, and resumed my journey in the fly.

"My next difficulty was to find a place in which to change from tights into full naval uniform. I decided to do this in the cab, and implored the driver to go slowly down the hill. As everybody knows, there is little difficulty in pulling off clothes and putting others on in a cab, even in total darkness, but there comes a moment when one has to stand up to complete one's toilet, and to stand up in a low fly is no easy task. 'Driver, just pull up a moment,' I said, 'and open the top of the cab.' 'It's pouring with rain, sir,' was the answer. 'Never mind that,' said I. 'You get on top, too and hold your coat over me.' This arrangement answered beautifully, and in due course of time I arrived at the landing and went off in a steam launch to make my obeisance to his Imperial Majesty. The Emperor received me in his usual cordial manner, and, after a good laugh at my description of all my adventures, 'Well, anyhow,' he said, 'I have never been asked to dine with two Sovereigns the same day. Do you want more dinner?'"

"On one occasion his Majesty honored me by coming to race on board my yacht, the Carina, when we were lucky enough to win the first prize. At times, when we were diving into the seas in the strong wind, I admit to having felt a certain amount of anxiety with such an important charge on board, but all went well, and he seemed thoroughly to enjoy it, and did not mind getting wet."

"Every one who races has his own opinion as to the size of yacht he prefers for the first-class racing. For my part, I think that of late years we have built too big crafts. They are decidedly more expensive, and, to a certain extent, in heavy weather involve too great risk to life and spars to be pleasant. All round the coast, with but few exceptions, tides have to be studied as of first importance, and these large vessels, drawing such an inordinate depth of water, are in consequence severely handicapped. Then, again, they are quite unsalable when their racing days come to a close. I think that a cutter should not exceed 150 tons as the outside limit for racing in British waters."

His advice to beginners, short, but to the point, is that they should first adopt small-boat sailing in order to acquire knowledge and self-confidence.

The Sun and Moon and Tides.

THE regular periodic rise and fall, or flow and ebb, of the oceans and the waters tributary to them is due to the attraction of the sun and moon, according to the Marine Journal. By the law of gravity the attractive force of these two commanding heavenly bodies decreases with the square of the distance. For this reason the nearer surface of the earth is attracted more strongly and the further surface less strongly than the center.

The waters of the ocean are free to yield to this tendency, and hence tend to be heaped up into four tidal waves, two lunar and two solar, with the lunar greatly in predominance. The solar tides are noticeable chiefly as reinforcing or diminishing the lunar tides.

With the revolution of the earth on its axis these waves cause two principal alterations of high and low tide every twenty-four hours in every part of the ocean.

The Convert.

Somewhere in his writings, Capt. Kenealy advises small boat men to purchase a ship's yawl or life boat and rig it. Harold Bindloss has told in The Yachting Monthly of an experiment of this kind he made. It makes good reading and is instructive, too. Here it is:

The conversion of a ship's boat into a sailing craft is a laborious and, now and then, a disappointing operation, since the convert usually contrives to retain her original weaknesses and not infrequently adds new ones to them. I was aware of this, but economic reasons appeal strongly to some of us, and they did so when I was offered a coaster's 16-foot boat in comparatively good order for next to nothing. She was clincher-built, beamy, shallow, and intended for propulsion by oars: and, though such craft often run well under sail, the problem is—how to get them to windward. It is also one that has never been altogether satisfactorily solved—in any case, where they have to face open water.

Since a centerboard could not be fitted conveniently, the obvious thing was to put a keel on her, but, in the first place, there was little to fasten it to, for the keels they build these boats on are shallow and narrow. There was also the difficulty in boring straight through the center—the holes most amateurs sink come out at the side. This, however, was mastered; about 4 inches depth of timber, cambered to nothing fore and aft, was bolted on, the mast beam was kneed in, the clamp was fixed. Then the lug mast was made, of a grown stick, with as much as possible of the outside, where the strength is, left on; and I followed the Scotch fisherman's practice in dispensing with a revolving sheave.

When the latter is used there is, after it is a little worn, a certain probability of the halyard's slipping off and jamming between it and the side of the slot. In spite of the trifling extra friction, it is better to fit a solid piece of close-grained hardwood; half of a block-sheave sawn across the middle, driven tightly in and fixed by two nails, serves the purpose well. Then one can depend upon the halyard running freely when it is wanted to do so. The boom was the next consideration; in an open craft it is a temptation to dispense with it, which is perhaps safer; but the loose-footed lug needs a longer mast to set the same area, which implies some loss of stability. The boom was made with bee-blocks for reef-pennants, each rove double and led to a separate holed cleat, with the result that one smart pull would bring the leach down and the earring could be jammed in a second. One has to consider these things in single-handed sailing; it is only unfortunate that one does not usually think of more of them beforehand.

At last she was launched with fire-bars and a couple of bags of shingle neatly packed on her floorings; and some days later I pulled off for an experimental sail. It was a lowering afternoon, with a moderately fresh breeze blowing right out of the mile-wide bay, which opened into the Irish Sea, with a long stone quay at the outer end of it. The program was simple, so far as appearance went; I would make two tacks to the head of the inlet, and then run back and adjust anything that needed it before venturing outside.

It, however, struck me that there was a good deal of water in her, though she had scarcely leaked at all before the alterations were made. After bailing it out, the mast was stepped—she was fitted with what is called a sailing beam bolted to either gunwale, so as to carry the clamp as high as possible, which is advisable in a shallow craft. Beneath it, forward of the mast, the new hemp cable was coiled away, and it may be pointed out that where the expense of galvanized chain is a deterrent one should use a soft grass warp. I did not, because none was obtainable in the locality; but I should have remembered to stretch that cable ashore with a tackle. Then the jib was hauled out; with a low sail plan she apparently needed a long bowsprit.

Running up the lug, I got away, close-hauled, and it was first of all noticeable that she was listing more sharply than she should have done; then as she stretched out across the inlet it became evident that she was not making much to windward. A pull on the mainsheet did not remedy this, and by the time she was halfway across I was perched on the weather gunwale, looking up to windward somewhat anxiously. There was an ominous rustling in the woods along one shore, white ripples streaked the slate-green heave, and more water than was desirable already splashed among the ballast. I thought I would put the helm down and bring her round, but a difficulty appeared—the lee jib sheet, which was led through a hole in the after thwart, could not be reached from the gunwale, and my weight was needed there. Slipping down as the helm went to lee, I whipped it loose, and, coming up head to wind, she stopped, and refused to swing the trifle further that would have brought the jib aback. It is the small craft's trouble, and the addition of the cambered keel had not cured it.

The obvious thing was to pull her round, but, though the thole pins were ready, it is difficult to row beneath a banging boom which smites one on the head and shoulder. Throwing the oar into the stern notch, I sculled in desperation, with the mainsheet sawing to and fro and worrying me, and in the course of a minute she fell off upon the other tack. Still, it was astonishing to see how far she had driven to leeward during the time.

Heading home, gunwale just awash, with the end of the quay under the lee bow, a squall struck her, and a foot of slacked mainsheet hardly picked her up; then as she began to fall off, in spite of a put-down helm, the jib had to be slackened also, and the single-hander knows what a liberated jib can do. It threatened to shake the mast out of her, and, as there was no sign of the squall's passing, it was necessary to consider. One might nurse her through it, but the trouble was that she was going to leeward in an alarming fashion, and it was doubtful if she would recover the distance lost. I decided to get a reef down, though the middle of the vicious squall is not a desirable time for the operation.

There was a becket ready to loop the helm a-lee, the jib was backed, luff tackle, leach earring worked satisfactorily, and then, because it was not wanted, she came round during the proceedings and headed across the bay again. This would not have mattered had she headed to windward, but she woul not lie high enough to make up her leeway, which was alarming. The center of effort had looked all right on paper, but, as sometimes happens, it was different under way, and there are few things more disconcerting than to feel the boat carries no weather helm. The breeze was also freshening, and, as there were ugly basalt rocks ahead, it appeared advisable to set a smaller jib; but here the sailing beam presented a difficulty. One could lean forward over it at the moorings, but this was less easy with the boat plunging and the jib thrashing one's shoulders; besides, the wet outhaul would not render. After a breathless struggle I discovered that the jib could not be changed.

The remedy was to anchor and straighten things out, but you cannot conveniently keep an anchor ready stocked in an open boat—it has a way of fouling your gear—and I spent valuable moments getting the forelock in. After that the new cable doubled up in bights and hitched itself about the halyard pins, while the few fathoms I hurriedly cleared out would not reach the bottom. The situation was now embarrassing—she was half a mile off shore, driving rapidly stern first toward the Irish Sea, and the water was gathering fast inside her. Streaks of crisping froth lined the bay; there was now too much wind to pull her round. She must be jibed before she drifted out into the open water.

She fell off, ran unpleasantly far to leeward before she would bring the boom over, dipped her gunwale in the roll, and kept it just awash when she faced the breeze again. I sat outside the weather quarter, with a bag of shingle frantically dragged up on that side beneath me, and the short close reach home was an anxious one. There were inches of water inside her, and more was coming in to leeward every moment; she would drive away off shore if I luffed her up to bail. Sometimes as the eddying puffs raced down from high ground she brought the quay under her lee bow; sometimes it crept up to weather, and my courage sank. There was no safe place to beach her if she missed it, and I had had enough of trying to bring her round. Somehow she must be made to weather the end of that quay.

It was touch and go, and she might not have done it, only that she screwed up, gunwale under, in a vicious squall; and I drew a breath of sincere relief as she drove into harbor. I had had my fill of sailing her for one day, but it was a consolation to know her weaknesses, since there were remedies for some of them.

A low-water examination revealed that her lying dry with ballast in, supported on bilge and keel, put a leverage on the latter which opened the garboard seam—boats of this kind are far from strongly built. She also obviously needed more lateral resistance, and, considering that what she had already strained her, the question was how to stiffen her to carry an increased keel. The first step was to double the garboards outside—it can be done neatly with a clincher boat—and then I simply spiked on the extra layer of keel. More through holes were out of the question. Keel and extra garboards were slotted in three places, and strong iron angles sunk flush in the notches in back-to-back pairs and firmly bolted to each other horizontally through the keel. This left one arm of each still unattached, and three solid grown frames, notched to fit the landings, were placed inside the boat above the angles, which were fastened to them through the planking. Frames and angles now spread the side pull on the keel well over the cross-section of the hull, and this is probably the best method of fixing a deep keel upon a lightly-built boat.

After that the sailing beam was pulled out and the mast clamped to a thwart; a pair of shrouds made up for the loss of height from step. I fixed a smooth strip of hardwood below the halyard pins, so the halyard could be secured against its face by merely pulling a bight beneath the standing part. In a small single-hander it is better to lead the halyard through a thimble grommeted to the yard and then hitch it to the traveler ring; when, if the latter jams, as it sometimes does, the rope will render through the thimble. This necessitates the purchase being applied to the luff of the lug, and, after experimenting, I found it handiest to screw a hardwood cheek, bored through, to the mast above the clamp, and reeve a stout, greased earring through it with a hook in either end. The after one hooked into the sail cringle, the forward one into a luff-tackle fastened to the stem. It would peak the yard with one strong pull.

Next the bowsprit was sawn short and a curled hook spliced to the bobstay end, just where one could reach it with the toe of the jib, which saved an outhaul. Then there was a larger rudder to make—you can give it length on the waterline, rounding off below—and fresh holes to be bored in the strip nailed to the after thwart, through which the jib sheets led, crossed. By that plan the lee one is always to weather, where you can reach it when sitting on the gunwale. It is a pity there is no really satisfactory method of fitting a single-hander's mainsheet so that it can be belayed and, what is more important, let go instantaneously.

I had no trouble when she went to sea again. She would stay and work to windward in anything except the steep head sea which stops any shallow-bodied boat. There was no cure for that—one needs the deep wedge section, with weight well below, in open water. What was more, she would lie-to with tiller becketed and jib aback while one reefed her, which is a thing one cannot trust all open boats to do.

Finally, she proved that while a ship's pulling boat can be converted into a moderately efficient sailing craft at no great cost, it is on the whole advisable to buy or build a new one, though even in the latter case her owner is not invariably satisfied. Boats have their idiosyncrasies, and in their construction the one small point you overlook often makes a vast difference.

Captain Barr Dead.

CHARLES BARR, skipper of Columbia, Reliance, Westward and other famous yachts, died suddenly of heart failure at Southampton last Tuesday.

Charles Barr was born at Gourock, Scotland, on July 11, 1864. He spent his boyhood on the rocky coast of the sea, and there learned such rudiments of sailing as all boys who live by the water know. He was apprenticed to a grocery man in Greenock, and might have become a successful tradesman had it not been for his brother John, who commanded a fishing smack, from which he was eventually graduated to the command of racing yachts on British waters.

This brother sailed the Thistle, which came across the ocean in an attempt to lift the America's Cup. His example so inspired Charles that in spite of the family opposition he quit the grocery business and went before the mast in a flounder trawler, where he spent two years fishing and met with many of the hazardous experiences common to life on these small boats. Toward the end of the season he is said to have saved a ship and her crew by an exercise of the courage and judgment which afterward made him famous. It was not long before his natural skill and born power of command won him recognition and the captaincy of a vessel.

He brought the 20-ton Clara across the Atlantic, the trip lasting nearly forty days, and sailed her in numerous races on this side of the water. On his return to Scotland he was given the command of the famous Fairlie 40-footer Minerva and sailed her to America in twenty-eight days through a dangerous succession of storms that again proved his resource in time of danger. Barr was skipper of the Minerva for three years and while sailing her made his reputation as a racing commander, defeating the crack yachts of the day one by one.

His percentage of victorious races with this boat is perhaps the highest in American yachting annals. Following the Minerva he commanded in turn the Oweene and the Wasp. Next he was mate for his brother, John Barr, on the Thistle. This was his first experience in races for the America's Cup and taught him much that afterward proved of value to him. He was commissioned by George Gould to sail the Vigilant in her trial races against the Defender, and his handling of her was so masterly that many believed he should have had the chance to command the American defender in the final test against the Valkyrie III. This showing procured for him the position of skipper on the Columbia when Sir Thomas Lipton challenged with the first Shamrock.

He successfully defended the cup for the third time with the Reliance. Later he won a score of notable victories abroad with Commodore Plant's Ingomar. Only last June he won at Kiel with Alexander Smith Cochran's steel racing schooner, Westward, and on Aug. 3 at Cowes he won the German Emperor's Cup with the same boat.

Cruise of the Seneca.

IT seems strange that whenever a yachtsman fits out a sailing craft or an auxiliary for a cruise in the West Indies, some newspapers always figure out that he is going on a treasure hunting expedition. The latest to get credit for such a cruise is Demarest Lloyd, who recently purchased the auxiliary schooner Seneca, and who sailed away from this port last week. Seneca was fitted out for the cruise in South Brooklyn, and some reports told how she was fitted with diving apparatus and rigging for dredging and recovering lost treasure. Mr. Lloyd last year owned the schooner Shiyessa and took part in the Bermuda race. It is his intention to take part in this year's race with his new yacht, but in the meantime he and some friends are enjoying a long cruise on Southern seas. With him are Vice-Commodore John B. Fallon, of the Corinthian (Marblehead) Y. C., and Arthur Coombs, and later Beals C. Wright and W. B. Lloyd, brother of the owner, are to join the party.

The yacht sailed for Puerto Rico, and after leaving there, the Seneca will cruise through the Lesser Antilles, making about half a dozen stops before reaching La Guayra. Then the yacht will touch at Curacao, Kingston and Santiago. Coming home stops will be made at Havana and Nassau. This cruise will last until next May, when the yacht will arrive home and fit out at once for the race.

Seneca is 95 feet over all, 68 feet on the waterline, 20 feet 5 inches beam and 10 feet draft. She was built from designs by Cary Smith and built by Poillon in 1901.

C. A. Wood, a Young Skipper.

Probably the youngest handler of racing yachts on the New England coast is Cornelius Ayer Wood, the sixteen-year-old son of William M. Wood, president of the American Woolen Company. He is a member of the New Bedford Y. C., while his father is a member of the Eastern, Corinthian, New Bedford and New York yacht clubs. Cornelius Wood, according to the Boston Herald, owns three boats—the Little Rhody II., a knockabout with a winning record second to none of her type; the Irene, a fast auxiliary centreboard, and the Osprey, a fast and able catboat. It is said that Master Wood is negotiating with a well known Boston yacht designer for a new Sonder boat and will probably race her at Marblehead and vicinity.

Master Wood is not a fresh water sailor; he likes the deep water and a long trip with a spanking breeze is his delight. He has taken the Litttle Rhody II. round the cape to New York and on other trips which required seafaring skill. During the summer months the youngster passes his time racing at Marblehead and New York, cruising along the New England coast and among the islands of Maine, alternating with short trips on which his father, who is also an enthusiastic yachtsman, or other members of his family, accompany him. The Little Rhody is moored during the season off the North Shore at Pride's Crossing, the summer home of President Wood and family. During the remaining months of the year the young sailing master attends the Middlesex preparatory school at Concord.

This young yachtsman is very proud of his boats, but in particular of the Little Rhody II., for she has a long record of wins to her credit and has captured places against boats of a much larger class, as in the Boston Y. C. races last year, when she got fourth place against class P boats or 31-raters, the Rhody being a class Q boat or 25-rater, a very creditable performance against such boats as the Amoret, a class P boat, 53 feet over all, while the Little Rhody II. is but 38 feet.

The record of the Little Rhody II. is ten firsts and seven second prizes out of 33 starts in 1907, the year she was built; while in 1908 she captured the Jamestown Exposition cup. In 1909 she sailed in the Corinthian mid-summer races off Marblehead and won two out of three. Last year she got second place in the Gloucester Y. C. race, fourth in the Boston Y. C. events against class P boats, or 31-raters, and second place in the Eastern Y. C. open regatta.

This year the Little Rhody II. won two out of three races in the Corinthian Y. C. mid-summer series, which gained for her the award of the cup. She also won four races for the club championship in class Q and was awarded the championship of her class.

ARTHUR BINNEY
(Formerly STEWART & BINNEY)
Naval Architect and Yacht Broker
Mason Building, Kilby Street, BOSTON, MASS.
Cable Address, "Designer," Boston

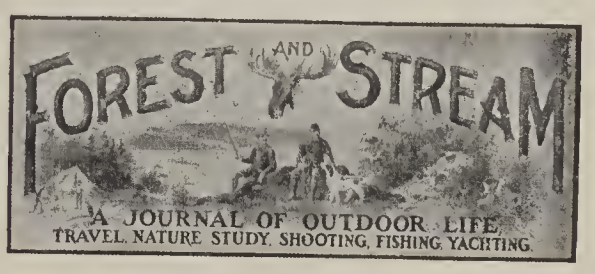
Canoe Handling and Sailing.
The Canoe: History, Uses, Limitations and Varieties, Practical Management and Care, and Relative Facts. By C. Bowyer Vaux ("Dot"). Illustrated. Cloth, 163 pages. Price, $1.00. New and revised edition, with additional matter.
A complete manual for the management of the canoe. Everything is made intelligible to the veriest novice, and Mr. Vaux proves himself one of those successful instructors who communicate their own enthusiasm to their pupils.
FOREST AND STREAM PUBLISHING CO.

My Friend The Partridge.
S. T. Hammond. A delightful reminder of crisp autumnal days in the covers. It tells of sport with the noblest of game birds, the habits and habitat of the ruffed grouse, with just the right touch of reminiscence and personal experience. Cloth. Illustrated, 150 pages. Postpaid, $1.00.
FOREST AND STREAM PUBLISHING CO.



CORRESPONDENCE.
The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. The editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.
Subscriptions may begin at any time. Terms: For single copies, $3.00 per year; $1.50 for six months. Rates for clubs of annual subscribers:
Three Copies, $7.50. Five Copies, $12.
Remit by express money-order, registered letter, money-order or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canada and Great Britain. Canadian subscriptions, $4.00 a year, $2.00 for six months.
Foreign Subscriptions and Sales Agents—London: Davies & Co., 1 Finch Lane; Sampson, Low & Co. Paris: Brentano's. Foreign terms: $4.50 per year; $2.25 for six months.

ADVERTISEMENTS.
Inside pages, 16 cents per agate line. Special rates for three, six and twelve months. Eight words to the line, fourteen lines to one inch. Advertisements should be received by Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money, or they will not be inserted. Reading notices, seventy-five cents per line. Only advertisements of an approved character inserted.

Display Classified Advertising.
Hotels, Summer and Winter Resorts, Instruction, Schools, Colleges, etc. Railroad and Steamship Time Tables. Real Estate For Sale and To Let. Seeds and Shrubs, Taxidermists. The Kennel. Dogs, etc. Wants and Exchanges. Per agate line, per insertion, 13 cents. Three months and over, 10 cents per line.

Solid Classified Advertising.
For Sale. Kennel. Property For Sale. Real Estate For Sale or To Let. Wants and Exchanges. Per agate line, 10 cents. Absolutely no display. No advertisement of less than three lines accepted. Cash must in every case accompany order.

FOREST AND STREAM PUB. CO.
127 Franklin St., New York.

At Sea Gate and Larchmont, N. Y., out of five starts, she won two firsts and a second against such boats as Gray Jacket, More Joy, Soya II., Spider II. and Florence. All of these boats, but two, are this year's boats.

The Rhody II. is of the knockabout type (keel), and was designed by George Owen, of Newton. She was built in East Boothbay, Me., in 1907, by Hodgdon Bros. She is 26 feet on the water line, 38 feet over all, 8½ feet beam and 6 feet draft. She is very solidly built of double mahogany, varnished, and this year received an entirely new suit of sails from Wilson & Silsby, Boston. She was purchased in 1909 by William M. Wood from Charles F. Tillinghast, of Providence, R. I. The racing crew of the Rhody II. includes Capt. Ralph Gray, of Deer Isle, Me., who has sailed some of the large coasters and also pleasure boats; Cornelius Ayer Wood, Frederick Ayer and R. G. Monroe.

The Irene, a 30-foot auxiliary sloop, and an exceptionally fine sea boat for her size, having been used for cruising, like the Little Rhody II., from Bar Harbor, Me., to New York. She is solidly built, cabin finished in mahogany, has electric light plant, and has all the conveniences of a larger boat, including galley, toilet room, forecastle and a light and airy cabin.

The Irene was designed and built by Wilton Crosby, of Osterville, and is one of the fastest auxiliary boats on the coast for her size, particularly in a blow. She is 38 feet over all, 30 feet on the water line and draws about four feet of water with the centreboard up. She has sleeping accommodations for five persons. Her auxiliary power is furnished by a 20-horsepower Murray & Tregurtha motor.

The Osprey, the third of the fleet, is a very fast and able catboat, 16 feet water line and 20 feet over all. Master Wood uses her for day sailing and cruising about Cuttyhunk Island, where the young yachtsman's family also spend a portion of the summer season.

Motor Boating.

No Havana Race this Year.

The Yachtsmen's Club, of Philadelphia, will not have a race to Havana this year. Yachtsmen have not taken this event very enthusiastically, and the club does not think it should spend the money such a race entails unless it is well supported. Such a race is too big to have every year, and the feeling in the club is that once in two years is often enough.

An extract from a Havana paper tells the story that yachtsmen there are not very enthusiastic. "Havana is not likely to see any yacht racing this winter," it says. "The recent hurricane put several of the yachts belonging to the Havana Y. C. out of commission, and has the effect of reducing interest in any great amount of yachting this season.

"While several of the members are advocating the taking up of an attractive program of sport for the winter, it does not appear that a majority of the yachting enthusiasts are eager to enter the lists.

"There had been talk that some new boats might be shipped to Havana from the workshops of yacht builders in the North, but so far none of the yacht club members has taken steps toward this end. The proposed regatta is not likely to be held this winter.

"It is generally admitted that Cuba offers some of the best possible facilities to boom yachting, but it is freely remarked by the visitors to the island that there is a decided lack of interest in the sport."

The club plans to hold its annual ocean race on July 12. The start will be from either off Atlantic City or Ocean City, and the course will be around Northeast End Lightship off Cape May, Fenwick Island Shoals, Over Falls Light and return to the starting point, or to Fire Island Light and return.

The Yachtsmen's Club has elected these officers: Commodore, J. G. N. Whitaker; Vice-Commodore, J. A. Lucey; Rear-Commodore, M. A. Brigham; Secretary, M. G. Belknap; Financial Secretary, H. A. Muller; Treasurer, R. M. Vanderkerchen; Directors—R. H. Crowell, A. M. Rennick, R. L. Young and Joseph McElmell.

Big Craft for Morton F. Plant.

Morton F. Plant, who now owns the big steamer Iolanda, and who is having the 86-foot schooner built at Herreshoff's, has placed an order with the Gas Engine & Power Co., at Morris Heights, for a twin-screw, steel gasolene yacht, which will be built from designs by Charles L. Seabury. This yacht will be used as a tender for the racing schooner. The dimensions of the new yacht are 138 feet over all, 131 feet on the waterline, 16 feet beam and 5 feet draft. The machinery will consist of two 6-cylinder air starting and reversing Speedway motors of 300 horsepower each. The yacht will be lighted by electricity throughout. The bridge will be placed aft of the forward deckhouse. A 21-foot motor boat with a 4-cylinder 12-16 horsepower Speedway motor will be carried on the davits as well as 24 foot and 16 foot rowing boats. A speed of 20 miles an hour has been guaranteed and the contract calls for delivery not later than June 1.

There will be two deckhouses, the forward one to be used as a dining saloon, with butler's pantry connecting same at the after end, while the after deckhouse will be used as a social hall and will have a large stateroom at the forward end, fitted with brass bed, dressing case, wash basin, etc., Below decks forward, starting at the bow, will be the chain locker followed by boatswain's locker and forecastle. Next aft are the staterooms for steward, engineer and captain, the officers' mess and toilet. The galley will extend the full width of the vessel with dumbwaiter connection to the steward's pantry. Next aft is the engine room, with steel bulkheads fore and aft, followed by the compartment for the fuel tank. In the owner's and guests' quarters will be two double and three single staterooms, two complete bathrooms, a dressing room and linen and wine lockers. The yacht will be beautifully finished and furnished throughout.

Suzanne a Seaworthy Craft.

The 45-foot cruising motor boat Suzanne was shipped recently from here to Galveston. There she was put overboard and proceeded under her own power across part of the Gulf of Mexico to Calcasieu River, up that river to Lake Charles, where she is to be used by her owner, L. J. Bell. On this trip the yacht did well and proved seaworthy and able, and her motor did all that was required of it.

This craft was built by the Gas Engine & Power Co., and is 45 feet over all, 10 feet 6 inches beam and 3 feet draft. She is arranged with a raised deck forward, a midship deck and a trunk cabin aft, with deck on either side and an after deck. The galley, the motor room and the crew's quarters are forward, the compartment being commodious and well ventilated. The owner has a liberal size cabin, a stateroom with a full, wide berth and a spacious toilet room. Comfort and convenience are characteristic of the type, which is of Seabury's design. It is lighted throughout by electricity. The interior is finished in mahogany, while the outside joiner work is of teakwood.

The power is a 4-cylinder, 6 inches by 6 inches, Speedway motor, of 32 to 40 horsepower, and has every improvement to date. The boat's name is Suzanne.

The company is about completing a duplicate of Mr. Bell's vessel.

Albert H. Schmidt, of Detroit, Mich., has placed an order with the Seabury Company for a cruising power yacht of 50 feet length. Her speed will be from 17 to 18 miles an hour. The engine will be of the Speedway type and of six cylinders. Mr. Schmidt will use the yacht on the Great Lakes.

Margo a Good Cruiser.

One of the best of the yachts now building from designs by Bowes & Mower is the Margo, which is for a member of the Island Heights Y. C. This vessel, which is 45 feet 9 inches over all, 43 feet 6 inches on the waterline, 10 feet extreme beam and 3 feet 3 inches extreme draft, is building at Kirk's yard at Toms River. She will be equipped with a 50-horsepower Vulcan motor, 6¾ by 7¾ feet.

Inside she will be finished throughout with mahogany, and her plans have had in view the extreme comfort of the owner, so that besides being one of the fastest motor boats afloat, she will also virtually be a houseboat. Margo has a nearly plumb bow with considerable flare to her forward section and her stern is of the V transom type with enough rig for safety in a following sea.

The main features of the arrangement are the owner's stateroom forward and the separate galley just forward of the large after cabin. The engine is amidships in a watertight compartment arranged with a toilet room and two berths for the crew, a good work bench and ample stowage space. The main cabin is entered by a companionway from the afterdeck and has wide sofas on either side which can be extended and made into comfortable berths at night. Back of the transoms book shelves and lockers with leaded glass doors are arranged, and on the port side at the forward end is a sideboard. The forward companionway is on the starboard side and the steps land in a passageway from which doors open into the owner's stateroom, toilet and engine room.

There is a flush deck 10 feet long aft of the cabin trunk where wicker deck chairs will be used and there is a passageway leading forward on either side of the house.

The mast forward of the bridge is intended for actual service, as sails will be carried, and it will be possible to handle her under sail in case of a breakdown. The gasolene will be carried in tanks under the afterdeck having a capacity of over two hundred gallons, which will give a cruising radius of about 600 miles.

Margo is now ready for planking and will be launched about April 1. Her owner intends to enter her in the race from Marblehead to Cape May, July 3, and other important events of the season. As she will have a low rating and is a boat that will be easily driven, the record of Margo will be watched with interest.

Canoeing.

A. C. A. Membership.

NEW MEMBERS PROPOSED.

Atlantic Division—George A. Diblin, Philadelphia, Pa., temporary address, Box 310, Nevada City, Cal., by Joseph W. Broomhead; J. H. Burwell, 2038 Grand Central Terminal, New York city, by Payne L. Kretzmer.

Central Division—Frank J. Minkel, 503 Ellicott Sq., Buffalo, N. Y., by Leo A. Hower.

MEMBER DECEASED.

Western Division—5966, Henry J. Goodrich, Highland Park, Ill. Members present at the 1910 Sugar Island Camp will remember Mr. Goodrich for his quiet geniality and miss him at future camps.

EVOLUTION.

If the shad could only be introduced here, I see huge possibilities for a new winter pastime —"shadding." Each player to be allowed one ounce of shad, all to start at a given signal, and the first to extract a thousand bones from his ounce to be declared the winner. Standard time, twelve seconds. If the late Professor Darwin had ever tried a mouthful of shad, it would have stabbed into him the conviction that the porcupine is merely the evolution of the shad-fed cat.—Fishing Gazette.

Of Course It Pays to Shoot

UMC **STEEL LINED SHELLS** UMC

Again In The Front!

FIFTH CONSECUTIVE WINNER

— of the —

GRAND CANADIAN HANDICAP

For the fifth consecutive time, the Grand Canadian Handicap was won with UMC Steel Lined Shells. Mr. Howard Bates carried off the honor, January 14, shooting from 31 yds., against 57 competitors.

Mr. George Beattie tied for **High Amateur Average** for the entire shoot, using UMC Steel Lined Shells.

Every Interstate Handicap in the United States for two years straight has been won with UMC Steel Lined Shells—proving in actual performance the strong claims made for their uniform velocity and superiority.

DRIVERS AND TWISTERS.

Wampum Keeper C. W. Budd, Des Moines, Ia., writes us that the Indians will hold their annual meeting and tournament at Spirit Lake, Ia., on Aug. 29-31.

On Feb. 4, the North Caldwell (N. J.) Gun Club will hold a shoot for purses and sweepstakes, and on Feb. 13 it will hold a shoot for special prizes.

The Hudson Gun Club, of Jersey City, and the Clarendon Gun Club, of Secaucus, N. J., shot a team match on the grounds of the latter, on Jan. 22, the Hudsons winning by a total of 299 to 277.

The Castile, N. Y., Sportsman's Club was organized with a membership of sixty-five and is still growing. They have a Dickey trap, good grounds, with shelter house, etc. The club proposes to hold a county shoot during the month of May. C. A. Van Arsdale is the Secretary.

Sixty members were present at the annual meeting of the Sunbury and Selinsgrove Gun Club, Selinsgrove, Pa., on Jan. 15. Important business was transacted and officers were elected for the ensuing year as follows: President, Grant E. Schuck; First Vice-President, Geo. Howell; Second Vice-President, D. A. Herrold; Third Vice-President, T. Snyder; Secretary, Dr. J. W. Schoffstall; Assistant Secretary, C. E. Foster; Treasurer, A. H. Seigfred; Field Captain, Bryan Teats.

The Harrisburg Sportsmen's Association's twenty-fourth annual live-bird handicap, for the Pennsylvania State challenge trophy, Feb. 22, will have handicaps from 26 to 32yds., entrance $15, birds included. Division of money, 40, 30, 20 and 10 per cent. Purse open to all. Realizing that it is an impossibility to handicap forty to fifty shooters so that all may be on an equal footing, we have again adopted the sliding handicap, whereby each shooter handicaps himself according to his form in this particular match, shooting in blocks of five. Killing 5 straight, step back 1yd.; missing 1 out of 5, remain at same mark; missing 2 out of 5, step forward 1yd. Entries close Feb. 16. The management reserves the right to refuse any entry. Starting promptly at 10 o'clock A. M., shooting over two sets of traps, we expect to finish by 4:30 P. M. Should you be late you can shoot up until 1 o'clock. Extra events will be shot on No. 1 trap. If you have ever been at our grounds it is needless to speak of same, birds or management; if not, come and get an idea of what a twentieth century shoot is like. Birds will be birds—no straight scores 1909, with forty-four entries—first money amounted to $148. Seventy-five entries, 1910. All entries must be made on blank application and mailed to G. W. Hepler, Harrisburg, Pa., on or before Feb. 16. High grade target and live-bird shells for sale. All kinds of refreshments and first-class dinner awaiting you at Paxtonia Inn. Penaltry entries may be made by paying $2 extra. Street cars marked "L," leave Harrisburg every forty-five minutes for grounds, beginning at 6 A. M. Karl Steward is the Secretary.

BERNARD WATERS.

The Interstate Association.

The radical changes of policy of the Interstate Association are worthy of careful perusal. They are as follows:

The Interstate Association, at its annual meeting in 1910, materially changed and improved the conditions governing registered tournaments. These changes were necessary for the best interest of trap shooting. They will benefit all concerned.

A broad experience has demonstrated that the registration of tournaments confers many important advantages to trapshooting activities, but that, if not safeguarded and controlled by proper restrictions, it is subject to many abuses, petty and serious. The promoter, actuated by purely business reasons, is the chief offender. For the sport or its advancement he care nothing; for the advertising profits, he hungers greatly. He complies with all the technical requirements of registration, although he himself may be all there is of his weakling club. His tournament may have only two squads at the outset, which dwindle away gradually to a squad or less, the whole a mere farce, but nevertheless profitable to the promoter under the old conditions. Each succeeding year the mushroom club and the hungry promoter were becoming more numerous, and accordingly the Interstate Association was expending money for which no return was given in the way of promoting legitimate trapshooting. Yet many legitimate attempts at holding tournaments resulted in failure, because the sum total of so much gun club effort exceeded the demand for competition. The majority of shooters have limitations to their purses, besides having a limit to their craving for competition. There is such a thing as too much shooting, with its harmful reactions.

Again, under the old conditions, a strong club holding a successful tournament often made excessive profits, which were out of all proportion as compared to the effort and expense of holding the tournament. Of course, the excessive profits came out of the shooters' pockets. The most successful clubs were those which used the Squier money-back system, which returns a share of the profits to the weaker shooters.

The new conditions will eliminate the undesirable features while developing the sport on lines that are broad, wholesome and permanent. The matter of good sportsmanship is given full consideration.

Referring more in detail to the changes mentioned, the Interstate Association decided that gun club program advertising by its members shall cease from Jan. 1, 1911.

In place of program advertising, the Interstate Association has substituted a yearly contribution of $20,000, to be apportioned to State Association tournaments and to the tournaments of gun clubs members of State associations, as herein defined. These apportionments of moneys are to be applied to the Squier money-back system of the clubs' respective programs.

Thus the moneys which heretofore went to hundreds of clubs, weak and strong, will now go directly to the shooters, much to their enrichment. Nevertheless, the clubs will directly benefit by the changes, since more shooters will support the registered tournaments because of the material inducements offered in the way of added moneys, freely contributed by the Interstate Association, and because of the greater number of shooters who will shoot through the entire program because of the benefits accruing to them from the Squier money-back system, which is fully described elsewhere herein, and is part of the tournament agreement.

At all times there will be a reasonable guarantee that when a tournament is registered, it will be worthy of the confidence and support of the trapshooting fraternity, and will have the dignity and importance incident to good auspices.

Shooters under the Interstate Association's new policy will be encouraged to organize State Associations and leagues of gun clubs where none now exist.

The yearly averages, compiled from the records of tournaments thus registered and standardized, are incomparably more valuable than are the averages compiled from the data of a multitude of clubs whose standards of competitions are loose or non-existent.

All this in a particular way—in a general way, the present requirements of registration make for responsibility, permanency and good sportsmanship, both of clubs and shooters. At present the mushroom club and speculative promoter have no standing.

REGISTERED TOURNAMENTS.

In place of program advertising, the Interstate Association has substituted a yearly contribution of $20,000.

In the apportionment of the $20,000 contributed by the Interstate Association, the States are divided into three classes, A, B and C.

Class A includes States with a population of 3,000,000 or over. To each State association tournament of this class the Interstate Association will contribute $300, to be applied to the Squier money-back system.

Class B includes States with a population of under 3,000,000 to over 1,000,000. To each State association tournament of this class the Interstate Association will contribute $200, to be applied to the Squier money-back system.

Class C includes States with a population of under 1,000,000. To each State Association tournament of this class, the Interstate Association will contribute $100, to be applied to the Squier money-back system.

The matter of population will be determined by the census of 1910.

A State Association in a Class A or Class B State, must have a membership of ten or more bona fide gun clubs located in ten or more different cities or towns.

A State Association in a Class C State must have a membership of five or more bona fide gun clubs located in five or more different cities or towns.

The Interstate Association, at its discretion, may exact proof of the proper organization of any State Association which applies for a registered tournament.

The foregoing applies to State Associations; or to a League of Gun Clubs in a State which has no State Association.

The following applies to individual gun clubs:

Any gun club, a member in good standing of a State Association or of a league of gun clubs, may apply for registration. Applications from gun clubs not members of a State Association or of a league of gun clubs, will not be considered. To each two-day approved tournament, the Interstate Association will contribute $100, to be applied to the Squier money-back system.

To each one-day approved tournament the Interstate Association will contribute $50, to be applied to the Squier money-back system.

When a gun club applies for a two-days' tournament, the granting of such application shall depend on the attendance at, and success of, previous registered tournaments of said club, if any were held. The determination of whether it shall be a one-day or two-day tournament is at the discretion of the Interstate Association.

Any application for a registered tournament must be made not less than ninety days in advance of the tournament opening date, with the exception of the month of April, 1911, for which month sixty days in advance will suffice.

The program each day at any registered tournament shall be 15 targets, $1.40 entrance, $1 optional sweepstake extra.

DIVISION OF MONEYS.

Regular program, Rose system, ratio points 5, 3, 2, 1.

Optional sweepstakes, percentage system, 40, 30, 20 and 10 per cent., class shooting. Ten entries and under, three moneys, 50, 30 and 20 per cent.

To be eligible for the Squier money-back system a contestant must compete in all regular program events.

The optional sweepstakes are separate from the regular program, and it is optional with the contestant whether or not he makes entry for them. The Squier money-back system does not apply to the optional sweepstakes.

There shall be no deviation from this program, as it relates to the Interstate Association, but special events may be scheduled and shot as club events.

Any gun club holding a registered tournament shall give one page of its program, of which the copy shall be furnished by the Interstate Association, for purposes of announcing the amount of money contributed by the Interstate Association and for purposes of publicity.

The Interstate Association's contribution will not be paid to any club until such time as such club, holding a registered tournament, shall have sent in the requisite report of the tournament to the Interstate Association.

When the fund of $20,000 is exhausted, tournaments will be registered, but without any contribution of added money by the Interstate Association. Thus, it is apparent that gun clubs should make their applications at their earliest convenience, even though their tournaments are scheduled to be held late in the year.

The Squier money-back system shall be a part of the program. It was originated by Mr. L. J. Squier, of Pittsburg, Pa. It designates a special fund created for the purpose of paying back the losses, or a share of the losses, of those amateur contestants who compete in all regular program events of a tournament and fail to win the amount of their entrance fees, less the price of targets. All contestants must shoot through the entire regular program to gain an interest in this fund. This special fund is made up from the added money contributed to the tournament; from the profits derived from targets trapped, and from an extra entrance fee of $1 per day charged each amateur contestant who competes in all of the regular program events each day of the tournament. Any contestant who competes in less than ten regular program events each day shall be charged 10 cents for each event in which he competes, which sums also shall become a part of the special fund, but such contestant shall have no interest in the Squier money-back system. Any division of money, such as Rose, percentage, etc., can be used for dividing purses; in fact, the division of money used does not affect the workings of the Squier money-back system.

The true Squier money-back system calls for a special fund derived from all added money, from one cent for each target trapped, and from the total amount derived from the extra entrance fee of $1 per day charged each amateur contestant. For example: Say that it was a two days' tournament; that $100 added money was contributed; that 6,000 targets were trapped; that 30 amateur contestants competed in all regular program events the first day and that 25 amateur contestants competed in all regular program events the second day. This would mean that the special fund would be made up from the $100 added money, $60 from the 6,000 targets trapped, $30 from the extra entrance fee of $1 paid by the 30 amateur contestants who competed in all regular program events the first day, and $25 from the extra entrance fee of $1 paid by the 25 amateur contestants who competed in all regular program events the second day, a total of $215, itemized more concisely as follows:

Added money	$100.00
6,000 targets at 1 cent	60.00
Extra entrance fee first day	30.00
Extra entrance fee second day	25.00
Total	$215.00

Now, further, say that the program each day called for ten events of 15 targets each, and an entrance fee of $1.40 per event—a total of 300 targets and a total entrance fee (counting the $1 extra entrance fee each day) of $30 for the two days. Deducting two cents for each target shot at, a total of $60 for the 300 targets, and it would leave a net cost of $24 for entrance fees to each amateur contestant who competed in all regular program events for the two days. This would mean that each amateur contestant who competed in all regular program events of the tournament and failed to win $24 or more would be paid back, out of the special fund of $215, the difference between what he did win and $24, or his equitable share of the $215 if it was not sufficient to pay back the losses in full.

By way of illustration, say:

First—That 10 of the amateur contestants competed in all regular program events, and that each of them won $24 or more.

Second—That 10 of the amateur contestants competed in all regular program events, and that each of them won less than $24, their losses ranging from $1 to $23, and that their total losses amounted to $105.25.

Third—That 5 of the amateur contestants competed one day only in all regular program events.

Fourth—that 5 of the amateur contestants, while present both days, did not compete in all regular program events.

Fifth—That the special fund amounted to $215.

This would mean the following:

First—That the 10 amateur contestants who each won $24 or more would be paid the amounts won by them respectively.

Second—That $105.25 would be taken from the special fund to pay each of the 10 amateur contestants who failed to win $24 a sum sufficient to make $24 when added to the amount each contestant did win.

Third—That the 5 amateur contestants who competed one day only in all regular program events would be paid the amounts won by them respectively, but would have no share in the special fund.

Fourth—That the 5 amateur contestants who were present both days and did not compete in all regular program events would be paid the amounts won by them respectively, but would have no share in the special fund.

Fifth—That $109.75, the balance left in the special fund, after $105.25 was paid to the losers as above mentioned, would be divided among the high gun amateurs who had competed in all regular program events.

By way of further illustration say:

That 10 of the amateur contestants competed in all regular program events and that each of them won less than $24, their losses ranging from $20 to $23.50, and that thir total losses amounted to $230.

This would mean the following:

That inasmuch as the special fund of $215 would not be sufficient to pay back the losses in full, the $215 would be divided by 230 to find what the proportionate share of $1 would be; $215 divided by 230 would make .9317, a fraction more than 93 cents per $1. Multiply each of the 10 contestants' losses by 93 cents, and it would give the amount of his proportionate share of the $215.

Contestants are not guaranteed that they will be paid back the total amount of their net entrance fees, but it is reasonable to believe that they will be paid back in full, as the statistical data in connection with tournaments conducted under the Squier money-back system shows that in each instance where the added money was placed in the special fund there was an amount sufficient to pay back the losses in full, and frequently there was quite a large surplus. When there is a surplus, it is divided among the high gun amateurs.

Professionals are not charged the extra entrance fee of $1, but are charged 2 cents for each target shot at by them, and 1 cent for each target shot at by them is placed in the special fund.

The working out of the Squier money-back system means that the less skillful shot can compete in all regular program events of a tournament and have a chance to win something if he is in good form, and if he fail to shoot up to expectations his sport costs him the price of targets only. The more skillful shot has a better chance of winning larger amounts than under the old way of adding a small amount of money to each event, because of the increased number of entries in each event, thus making bigger purses to compete for, and from the possible surplus from the special fund.

The question may arise: "Where does the gun club make on a proposition of this kind?" The question is readily answered by stating the fact that there is a reasonable profit in the one cent per target which goes to the club; that, as a general rule, the number of contestants is largely increased; that, consequently, the traps can be worked to their greatest capacity and the cost of trapping reduced thereby, and that the majority of contestants shoot through the entire regular program. In addition, the club makes on the proposition by sending home satisfied a lot of contestants who will return and shoot again.

Registration as herein set forth applies to United States gun clubs only. The old policy is still in force as to Canadian gun clubs.

Specifications in detail governing registered tournaments under the Interstate Association's new policy may be obtained on application to the secretary-treasurer, Elmer E. Shaner, 219 Coltart avenue, Pittsburg, Pa.

Pahquioque Gun Club.

Danbury, Conn., Jan. 19.—The Pahquioque Gun Club held its annual banquet at the Hotel Green, Jan. 19, 135 members and their friends being present. All previous banquets of the club were surpassed, and the spirit of good fellowship was supreme. Zucca's orchestra furnished the music. Many of the guests joined in the choruses until the hall overflowed with melody.

A half hour before the banquet a reception was tendered to the visiting State officers, thereby affording an opportunity to meet the commissioners who work in the interests of Connecticut hunters. Also some representatives of the ammunition companies were present.

The large tables were set in six divisions and were beautifully decorated. Pictures of hunting dogs, hung around the walls, afforded many delightful themes of sport afield.

American flags were draped about the room in an attractive manner, and deer heads here and there added to the beauties of the other decorations.

The menu was long and appetizing. Charles H. Peix, Jr., acted as toastmaster. Sweet song enlivened the proceedings later, and good talks on fish and game preservation met the approbation of the banquetters.

Crescent Athletic Club.

BROOKLYN, L. I., Jan. 21.—There was a busy day at the Bay Ridge traps, with fairly good weather to add to the pleasure of shooting. F. B. Stephenson scored a leg on the Stake trophy and the Lockwood trophy. J. H. Vanderveer scored for the monthly cup, while the leg for the James trophy went to G. W. Piercy. Several of the regular contestants were absent at Pinehurst. Yet there was a good attendance. C. J. McDermott, president of the organization, after an interval of several years, took part in the competition and performed well considering that he was out of form somewhat.

The special shoot at 10 pair had three ties on 13. A second tie on 13 required a second shoot-off, Piercy winning on the third shoot-off. It was a noticeable feature that all the winning ties were on 13.

Monthly cup, 25 targets, handicap:

J H Vanderveer	1	25	C R James	1	21
F B Stephenson	0	24	C A Lockwood	1	21
J S Lawson	5	24	J F James	1	18
G H Piercy	0	22	C H Pulis	0	17
A E Hendrickson	0	22	Dr C A Atkinson	0	13
D J Leahy	0	22			

Trophy shoot, 25 targets, handicap:

G H Piercy	0	23	J F James	1	20
C A Lockwood	1	23	F B Stephenson	0	20
C R James	1	21	J S Lawson	5	20
D T Leahy	1	21	A E Hendrickson	2	18

Prize divided.

Trophy shoot, 25 targets, handicap:

J H Vanderveer	1	20	Dr C A Atkinson	5	14
D T Leahy	1	24	J F James	1	22
F B Stephenson	0	24	A E Hendrickson	2	22
C R James	1	23	J S Lawson	5	18
J H Vanderveer	1	23	C A Lockwood	1	18
G H Piercy	0	23			

Prize divided.

Stake trophy, 25 targets, handicap:

F B Stephenson	0	25	G W Piercy	0	21
J H Vanderveer	1	24	J F James	1	20
J S Lawson	5	23	C R James	1	22
C A Lockwood	1	22	C A Lockwood	1	22
C H Pulis	3	22	Dr C A Atkinson	5	13
*J S Fanning	0	22			

J. F. James trophy, 25 targets, handicap:

G H Piercy	0	25	J H Vanderveer	1	21
F B Stephenson	0	24	A E Hendrickson	2	21
D T Leahy	1	24	C J McDermott	3	20
*J S Fanning	0	23	J S Lawson	5	19
C H Pulis	3	22	G Brower	1	17
C A Lockwood	1	22	J F James	1	16
C R James	1	21	Dr C Atkinson	5	8

C. R. James trophy, 25 targets, handicap, gun below the elbow:

C H Pulis	3	22	A E Hendrickson	2	18
D T Leahy	1	22	C R James	0	17
*J S Fanning	0	20	G H Piercy	0	16
C A Lockwood	1	19	Dr C A Atkinson	5	11
C J McDermott	3	19	J S Lawson	5	8
F B Stephenson	0	18			

Won on a toss by C. H. Pulis.

Trophy shoot, 25 targets:

C J McDermott	3	24	C R James	1	19
F B Stephenson	0	23	A E Hendrickson	2	18
J H Vanderveer	1	22	G H Piercy	0	19
D T Leahy	1	22	C A Lockwood	1	18
C H Pulis	3	22	G Brower	1	14
J F James	1	20	J S Lawson	5	11
*J S Fanning	0	20	Dr C Atkinton	5	7

Trophy shoot, 25 targets:

J H Vanderveer	1	23	C R James	1	18
F B Stephenson	0	20	J F James	1	14
J S Lawson	5	20			

Team race, 25 targets, handicap:

F B Stephenson	0	23	J F James	1	19—42

Shoot-off for J. F. James trophy, 25 targets:

F B Stephenson	0	25	D T Leahy	1	24

C. A. Lockwood trophy, 25 targets, handicap:

F B Stephenson	0	25	J H Vanderveer	1	21

CHAMPION W. R. CROSBY

The Target Championship of the World again won with

WINCHESTER

Loaded Shotgun Shells

EVERY SHOOTER WHO HAS EVER WON THIS COVETED HONOR HAS DONE SO WITH WINCHESTER SHELLS. SUCH A RECORD TELLS ITS OWN STORY. "A WORD TO THE WISE IS SUFFICIENT."

THE E. C. CUP, emblematic of the Individual Target Championship of the World, continues to nestle under W. R. Crosby's capacious shooting jacket, in the same old place it has been for the past ten years. Even such a gloriously good shot as Lester R. German could not separate the classic old mug from its long-time possessor. In the contest for the Cup at Chicago, on January 14th, both men shot wonderfully, weather conditions considered, but Crosby, with his Winchester "Leader" shells—regular stock loads—was not to be denied the victory. Of course, Crosby pinned his faith to the Red **W** Brand; for not only does it hold all the World and American Championship Trophies, but every shooter who has won the E. C. Cup has done so with Winchester Shells. A significant showing to say the least.

IN 1911 WHY NOT SHOOT THE SHELLS WITH THE RINGS AROUND THE HEAD, WHICH SHOOT RINGS AROUND ALL OTHER MAKES?

THE E. C. CUP

Fourth Mid-Winter Handicap Target Tournament.

THE Pinehurst tournament was held on Jan. 18-21, at Pinehurst, N. C.

Although the program was one that gave every opportunity for adequate returns to any amateur shooter who could shoot well up to the top of the averages in the regular events of the four days, and offered chances for those skillful and lucky enough to fall into the 9-hole in either handicap, the attendance was far from what was expected or what the liberality of the offerings in added money in the two handicaps also should have brought, as thirty was the greatest number who participated on any one day, though, all told, there were thirty-two participants in the tournament.

The weather was not what was hoped for, or what the outlook of Sunday and Monday foretold, as the sleet storm that was general about this section, did not slip by, and it made the air raw and the rain and fog that accompanied it did not add to the comfort or tempers of the shooters. That, though, was the luck in the draw, as one cannot pick out good weather always when events are set a year ahead. The golfers, who held full sway for the week prior to the shoot, had delightful weather throughout, but the shooters seem to be prone to bring Old Boreas and his worst antics when they come to North Carolina's unique winter resort.

Of course, where large tournaments are held but once a year, it is hard to obtain competent referees, scorers and other assistance, and though the management did all that was in their power to give good service, there were some slips that did not mellow the tempers of some of the shooters, although the writer saw many of the shooters who took every advantage of the unfamiliarity with the rules which the referees, scorers and pullers showed.

The shoot was under the management of Mr. J. F. W. Moore, who was here, there, and everywhere, and did everything in his power to give good service and to give the shooters what they wanted; and, taken as a whole, the traps held up very well under the strain to which they were subjected.

G. G. Westcott, of Leesburg, Fla., who won one of the Interstate Association's subsidiary handicaps in recent years, made a runaway race among the amateurs for the first day and scored 184 out of his quota of 200, his next nearest attendants being C. H. Newcomb with 172 and W. F. Clark with 171. Johnny Taylor stepped away out in front of the whole crowd with 188, and Harry Welles was the only one within hailing distance of him with 180. Geo. Lyon and Lester German followed with 177 each. The following are the first day's scores:

First Day, Jan. 18.

Second Day, Jan. 19.

This was the day of the greatest attendance, thirty participating in the day's events, all but one of whom shot through the full program of 200 targets, and it showed a new star in the firmament as far as high man for the day was concerned, as Dr. D. L. Culver, of Jersey City, N. J., who won the Midwinter Handicap last year, tripped to the fore with 188 scored, and Charley Newcomb was not far behind him with 185, thus jumping into a contending position behind Westcott; and Wm. T. Laslie, who had not showed any form the day previous, also amassed that total. Taylor, Welles and Lyon had a battle royal for the high honors, and the two former scored 189 each, and Lyon was just a jump away with 188, and German began to come, under the whip, with 186.

The weather was a little improvement over the day before, and the traps were let down a little and worked smoother, as the crews became more familiar with their work.

The following are the scores of the second day:

Events:	1	2	3	4	5	6	7	8	9	10	
Targets:	20	20	20	20	20	20	20	20	20	20	Broke.
Culver	19	19	19	17	18	18	19	20	19	20	188
German	18	19	19	18	18	18	19	18	20	19	186

E W Evans	16	17	15	13	11	13	13	12	13	12	135

Third Day, Jan. 20.

The morning of the third day was certainly foggy, and many a target was lost in the gloom, and it was no easy matter for the referees to see small pieces, as the trap houses were not easy to see, let alone a lightly hit target. In spite of these conditions the shooting was of a high order, and Charley Billings showed his foggy training at the traps at Travers Island, New York, and—to use Fred Gilbert's pet expression—put the whole crowd in the "game sack" with a 96, although Taylor and Henderson were "stepping some" with 95 each, and Newcomb and German each scored 93.

These events out of the way the decks were cleared for the Preliminary Handicap, and though some of the boys showed a preference toward shooting the handicap in the afternoon a vote was taken and the majority seemed to favor shooting right through, and this was done and the day's program cleaned up about 1:30 P. M., although some of the shooters wished afterward that they had waited until the afternoon, as the fog lifted and the afternoon was as bright and balmy as one could wish for and showed what could be offered in the way of weather down here in January.

The morning scores follow:

Targets:	20	20	20	20	20	Total.
Dr D L Culver	18	16	18	18	19	89
L S German	18	20	18	18	19	93

C H Anderson	18	15	18	17	11	79
J T Skelly	19	20	15	18	17	89
E W Evans	18	12	14	12	14	70

The fourth Preliminary Handicap was a pretty race, and up to the beginning of the last round three men had a chance to be in the van, with a couple of others not so very far away. Culver, the winner of last year; Wm. T. Laslie, who was making his first visit to Pinehurst, and "Chummy" Westcott, who was also making his debut here, though he is well known in shooting circles, all in the same squad, were having a merry dance, and Laslie was the boy with the sand in his shoes, as he ripped out 24 in the last round, while Culver dropped to 22 and Westcott went all to pieces and ended up with a 19, thus losing 6 targets in that round whereas he had only dropped five in the first 75, his third round being productive of the only straight in the event. Although these men were in the second squad, it seemed thus early that the winner was Laslie, and so it proved, as his total was 92, from the 19yd. mark, totaled from an evenly shot race, and Dr. Culver was second, from the same mark, with 90, and Westcott and R. L. Spotts, were third high with 89 each. The winner received $124 and a very handsome trophy; the second man received $93, and the third men received $46.50 each. The added money of $150 made the pot very pretentious and exceeded many events which have drawn a greater attendance. George Lyon led the post-graduates with a score of 92 from the 20yd. line; his next nearest competitors were Welles and Taylor with 86 each.

The following are the scores and handicaps:

	Yds.	Targets 25	25	25	25	Total.
Nuchols	19	23	20	21	20	84
Culver	19	23	21	24	22	90

Storr	18	23	21	19	22	85

Mid-winter Handicap.

The final day opened bright and fair, and about all that could he desired in the weather line, as the scores portray, and there was some very classy shooting on the part of many of the amateurs and professionals. Newcomb had passed Westcott for the leading honors and proceeded to maintain his advantage, and when the events had been shot out, it was seen that he stopped the simon-pures with 96, while that old war horse from away up in New York State, F. D. Kelsey, and Charley Nuchols, were next best with 92 each. Dr. Clarke, of Boston, summed up 91. Harry Welles got going and only tripped up on three, they being slipped in the third and fourth stanzas, and totaled 97, though Johnny Taylor had no idea of letting him get any nearer for the medal, and accounted for 95 of them himself, though Geo. Lyon came to his own and split the pair with a 96.

The fourth Midwinter Handicap was shot in the afternoon of Saturday, Jan. 21, and though the sky was bright, there was a pretty stiff wind, blowing directly from the back, and it tended to knock down the targets and make some of the quarterers so fast that the best shots on the grounds missed them, and there were some very classy shooters in attendance.

Culver, who was moved back to 20yds., and Laslie, who was penalized 2yds. and placed at 21 for his win in the Preliminary, early showed that they were hardly to be reckoned with, and Westcott got a very bad start by dropping 5 targets in his first round, but Newcomb and Nuchols, in the same squad, and both from the 19yd. line, showed that they were in the fight. Thus early it seemed to simmer down to three or four and when Newcomb had only lost 5 out of 50 and Westcott had lost 8, the winner looked to be there; but J. H. Anderson, of Philadelphia, surprised the bunch by only dropping 8 out of his first 50, and then only losing 1 in his third round, putting him in the lead with only 9 down to 10 for Newcomb and 11 for Westcott. There was some tension when the second squad, in which Westcott and Newcomb contested, went to the score in front of the club house for their last round, and both men shot nervy races, and Westcott tripped up on one which was dusted, and Newcomb allowed two to elude him, and they finished up sticks with 88. Shortly after this it was noised about that John Anderson could win, and every one turned to him when he went to the score, and though he had a good chance and could have tied in with a 22 and won with 23, he was not quite equal to the occasion and finished with 21 and a total of 87. This left a tie between C. H. Newcomb and C. G. Westcott to be shot off, and though Newcomb had Westcott on the defensive at three different times in the race, he allowed him to catch him and they were even up until only six or seven targets from the end, when Westcott went all to pieces, and the final result was 22 to 20, leaving Newcomb the winner of the cup and emoluments, amounting to $204.20; Westcott received $151; Anderson, $101.20, and C. W. Billings for his 85 received $50. There was some good average moneys, and Newcomb took down $36.02; Westcott, $24.46; Culver, $20.17, and Laslie, $15.

Geo. Lyon repeated his fox-to-the-hounds stunt in the Midwinter, as he had in the Preliminary, showing that he is "some" handicap shooter, with a score of 89, while Welles and Storr followed with 88 each. C. H. Anderson and B. B. Ward, both of Aberdeen, S. D., each made straights, as did Shorty Storr, these being the only straights. Thus ended the handicap and tournament.

Following are the scores:

	Yds.	Targets 25	25	25	25	Total.
Culver	20	20	19	16	22	77
Laslie	21	18	22	13	20	73
Westcott	19	20	22	22	24	88
Newcomb	19	23	22	20	23	88
Nuchols	19	22	18	21	20	81

97.28%

1910 HIGH AMATEUR AVERAGE

Won by MR. J. S. DAY, of Midland, Texas, using

Peters

Factory Loaded Shells

Mr. Day shot at **4280** targets in Registered Tournaments, breaking **4164.** an average of **97.28%**, exceeding by over **2%** the highest official amateur average of any previous year.

During the season Mr. Day made many long runs, among which are the following:

Gorman, Texas, and Walnut Springs, Texas, Aug. 15-17—**245** Straight
Walnut Springs, Texas, - - - " 17-18—**266** "
Midland, Texas, - - - - " 8-9 { **133** " / **121** "
Big Springs, Texas, - - - - " 10-11 { **175** " / **152** "
Cisco, Texas, and Gorman, Texas, - " 12-15—**190** "

PARTICULAR ATTENTION

is directed to the fact that all of Mr. Day's shooting was done with **PETERS REGULAR FACTORY LOADS**, purchased from dealers where the various tournaments were held. His shells were not special in any sense, but were regular stock goods such as can be procured from any **PETERS** dealer.

YOU can get this SUPERIOR AMMUNITION as easily as ordinary loads. You may not always score 97.28% but you will average better than with any other make.

Shoot the shells that have established another World's Record—97.28%—the kind that do not have to be used in any special make of gun to give best results.

ANOTHER Peters VICTORY

This Time a Legal One, and One of Great Importance

We are glad to announce to all our friends the conclusion of the long and hard-fought legal battle between The Peters Cartridge Company and the Winchester Repeating Arms Company. Suit for infringement of Patents was instituted by the Winchester Company in July, 1906; a decision in favor of the Peters Cartridge Company was rendered in the Circuit Court, July, 1909; the case was carried to the United States Circuit Court of Appeals – the court of last resort— where on January 11, 1911, the decision of the lower court was affirmed.

It is thus **finally** and **conclusively established** that the shotgun shells manufactured by us are not in any way an infringement of the Winchester Company's goods, but on the contrary, are made according to our own original ideas and scientific tests, by methods and processes which have made **PETERS AMMUNITION** famous for its **SUPERIOR SHOOTING QUALITIES.**

The summary shows that Charles H. Newcomb, of Philadelphia, Pa., was high in the 600 16yd. targets with 546 scored, and thus won the gold average medal, and C. G. Westcott, of Leesburg, Fla., stood second with 536, while Dr. D. L. Culver was third with 529, also receiving a silver medal. J. R. Taylor, of Atlanta, Ga., led the professionals with 567 scored; Harry S. Welles, of New York, was second with 558, and George Lyon, of Durham, N. C., was third with 552.

The summary of the 800 targets, including the two handicaps, shows that C. G. Westcott, of Leesburg, Fla., was high with 713 scored and received the gold medal, while Chas. H. Newcomb, of Philadelphia, Pa., followed closely with 711, and Dr. D. L. Culver, of Jersey City, was third with 696..

The race between the three high professionals for the entire 800 targets was a hummer, to say the least; J. R. Taylor, of Atlanta, Ga., leading with a score of 734; G. L. Lyon, of Durham, N. C., was second with 733, and H. S. Welles, of New York, was third with 732, these three being away out in front. The summary follows:

	1st Day.	2d Day.	3d Day.	4th Day.	T'l	P.H.	M.H.	Grand Total.

For the next year something quite attractive is in store for the shooters who are willing to go away from home and take a chance for a little coin of the realm.

There will be over $1300 in actual cash added to the program next year, and trophies to the value of $500. The trophies given to the winners of the two handicaps this year were about the handsomest the writer has seen offered at any shoot in several years.

The management will add $200 to the Preliminary Handicap of 1912, and guarantee the winner $200; and will add $500 to the Midwinter Handicap of 1912 and guarantee the winner of the event will receive a purse of $500. The winner of each event will also receive a handsome trophy.

The Squier money-back system will again be one of the features of the shoot, and a purse of $300 will be added for that purpose, and if there are fifty shooters the amount will be $400, and an additional $50 for each ten shooters above that number.

A new trap equipment will be installed before that time, and Luther J. Squier will have the management of the shoot, and John W. Todd will be cashier.

The Fred Macaulay Business Men's Gun Club.

NEWARK, N. J., Jan. 17.—Louis Colquitt was high average gunner at the Fred Macaulay Business Men's Gun Club weekly shoot to-day, over the Speedway traps. He had an average of 21 out of each possible 25, and his average would have been much better had he not shot a one-hand match in the last squad with John Geiger, breaking only 12 to Geiger's 13, bringing both of their averages down. Geiger, however, was second high average with 20 3-7 out of each 25. Frank Mihlon was third with 18 3-4; James E. Wheaton fourth with 18½; B. M. Shanley fifth with 18 1-10, and Henry Koegel sixth with an average of 17.

The weather was cold yesterday, which kept a great many shooters away, but, notwithstanding this, there were thirteeen squads that faaced the traps, eleven shooters were on the firing line and 1650 targets were thrown. The club house was warm and comfortable, and as usual a crowd of spectators was in evidence and a splendid afternoon's sport was had by all who attended. The scores:

Events:	1	2	3	4	5	6	7	8	9	10
B M Shanley	15	14	19	16	21	21	15	17	21	22

SMOKELESS.

Baltimore Tournament.

BALTIMORE, Md.—I beg to advise you that we, the A. G. Alford Sporting Goods Company, with the writer and Basil Wagner as managers, are going to hold our second annual clay target shooting tournament for amateurs (of course, the professionals may shoot for targets only), at Prospect Park, Baltimore, Md., March 16 and 17. We will give a much larger shoot this year than we did last year. We will also add more cash and give more prizes. Our shoot last year, we may add, was the largest that has ever been held in the State, there being present who shot through the two days' program 115 different shooters. We had 90 on the first day and 89 on the second day.

Our object in giving this shoot is not to gain one cent financially, but to promote the trapshooting game, giving the gain derived therefrom back as purses. There was left over from our first shoot $13, but we will add to this, as we published in our first program. We will also publish in this program a sworn statement of our expense and what we made.

Our program for the first day will be seven events at 20 targets, $2 entrance, $1.50 added. There will also be two events at 25 targets each, to be known as the special handicap merchandise race, open to amateurs only; entrance $3, in which event we will donate a great many prizes, possibly fifteen to twenty, ranging from $25 to $30 down to $1 each. Last year in this race our first fourteen prizes were valued at $5 or over, and ranged down to $1 each. There were twenty-six prizes altogether.

The program for the second day will include five events at 20 targets each, with $15 added, $2 entrance; besides, there will be shot off the second annual Maryland Handicap at 100 targets, with an entrance of $10, to which will be added $150 in cash, the winner receiving a sterling silver pitcher, valued at $50. The handicap in this event will be from 16 to 22yds., and the 22yd. mark will be used. This will be open to all amateurs everywhere. Moneys in this event will be high gun to win, no class shooting.

Our handicap committee for this race and the special handicap merchandise race will be Capt. Jas. P. Malone, Grason H. Gent, Walters T. Harvey, Emory H. Storr, of Baltimore; Frank M. Eames, of Philadelphia, and Miles Taylor, of Washington, D. C.

Besides this cash which we have added, we will give average prizes to the high amateur at all 16yd. targets, second high and third high; and to the low amateur average at all 16yds. targets.

Jan. 18, Capt. Jas. B. Malone will hold his live-bird shoot the same as he did last year, in which there will be miss-and-out events. There will be a 10-bird race. The 20-bird race, known as the Prospect Park Handicap, at which he will give a handsome silver cup suitably engraved. He will use two sets of traps, and will have a quantity of good strong country birds, which will make good flyers.

We will of course be unable to hold this under the Interstate Association rules, owing to their new rulings this year.

GEORGE P. MORDECAI.

The FOREST AND STREAM may be obtained from any newsdealer on order. Ask your dealer to supply you regularly.

New York Athletic Club.

TRAVERS ISLAND, N. Y., Jan 21.—The hazy weather was not unfavorable for trapshooting. E. A. Wilson scored a leg on the January cup with 24 from scratch. F. A. Hodgman was leader in the three events, the tournament cup, the Haslin cup and the distance handicap special trophy, tying in the latter event with Dr. De Wolfe, and winning in the shoot-off. In the double target event, 20 targets, O. C. Grinnell and G. F. Pell tied on 13.

Trial shoot, scratch, club special, 10 targets:

E A Wilson	10	A P Walker	8
Dr Brown	10	F A Hodgman	8
G F Corbett	9	O C Grinnell	7
W B Ogden	9	G L Bready	5
A E Ranney	8	G F Pell	3

Haslin cup, handicap, 25 targets:

F A Hodgman	0	24	Dr De Wolfe	2	20
W B Ogden	3	23	A E Ranney	3	20
O C Grinnell	1	22	G F Pell	1	19
G J Corbett	1	22	E A Wilson	2	19
Dr Brown	0	21	A P Walker	0	19
G L Bready	3	21			

Trial shoot, scratch, club special, 15 targets:

F A Hodgman	14	E A Wilson	12
A E Ranney	14	G F Pell	11
G J Corbett	13	O C Grinnell	11
W B Ogden	13	G L Bready	10
Dr Brown	12	A P Walker	9

Tie between F. A. Hodgman and A. E. Ranney won by latter on shoot-off.

January cup, handicap, 25 targets:

E A Wilson	2	24	G L Bready	3	20
F A Hodgman	0	23	A P Walker	0	19
O C Grinnell	1	23	A E Ranney	3	19
Dr Brown	1	22	Dr De Wolfe	3	18
G J Corbett	1	22	G F Pell	2	17
W B Ogden	3	22			

Club special trophy, handicap, 25 targets:

W B Ogden	3	24	A P Walker	0	20
O C Grinnell	1	23	G L Bready	3	20
G J Corbett	1	23	G F Pell	2	19
F A HodgmanNN	0	22	Dr De Wolfe	3	19
E A Wilson	1	22	A E Ranney	3	19
Dr Brown	1	21	Dr R Johnson	2	18

Tournament cup, handicap, 25 targets:

F A Hodgman	0	25	G L Bready	3	23
O C Grinnell	1	24	A E Ranney	3	22
Dr Brown	1	24	E A Wilson	1	21
G J Corbett	1	24	Dr De Wolfe	3	21
W B Ogden	2	24	Dr R Johnson	2	18
G F Pell	2	24	A P Walker	0	17

Distance handicap, special trophy, 25 targets:

F A Hodgman	21	22	Dr R Johnson	19	18
Dr De Wolfe	18	22	E A Wilson	20	16
W B Ogden	18	21	O C Grinnell	20	16
Dr Brown	20	20	G J Corbett	20	15
G F Pell	19	19	A P Walker	21	11
G L Bready	18	19	A E Ranney	18	10

Tie between F. A. Hodgman and Dr. De Wolfe won by the former on the shoot-off, 17 to 16.

Westley Richards gun, 10 pair doubles, scratch:

O C Grinnell	13	Dr R Johnson	9
G F Pell	13	Dr De Wolfe	7
F A Hodgman	11	A P Walker	7

Marine and Field Club.

BATH BEACH, N. Y., Jan. 21.—There was extraordinary activity at the traps of the Marine and Field Club today. Eleven events were shot. Four new cups materially added to the interest in the competition. The leg on the January cup went to C. M. Camp, who scored 88. Also he scored the first wins on the Sayre and Burham prizes, at 25 targets. The Bellows and Camp cups were the other two acquisitions. P. G. Chase, P. R. Towne and C. M. Camp tied for the Bellows cup, while C. E. Camp, J. H. Emanuel, Jr., tied for the latter. The ties will be shot off next week.

Monthly cup, 100 targets, strings of 25, handicap:

	Hdcp.		Total.
C M Camp	12	20 18 18 20	83
P R Towne	24	15 16 17 11	83

American Duck Shooting

By GEORGE BIRD GRINNELL

NO single gunner, however wide his experience, has himself covered the whole broad field of duck shooting, and none knows so much about the sport that there is nothing left for him to learn. Each one may acquire a vast amount of novel information by reading this complete and most interesting book. It describes, with a portrait, every species of duck, goose and swan known to North America; tells of the various methods of capturing each, the guns, ammunition, loads, decoys and boats used in the sport, and gives the best account ever published of the retrieving Chesapeake Bay Dog.

About 600 pages, 58 portraits of fowl, 8 full-page plates, and many vignette head and tail pieces by Wilmot Townsend.

Price, *edition de luxe* on hand made paper, bound in buckram, plates on India tint paper, each copy numbered and signed by author, $5.00. Price, library edition, $3.50.

FOREST AND STREAM PUBLISHING COMPANY
127 Franklin Street, New York

WOODCRAFT

By "Nessmuk." Cloth, 160 pages. Illustrated. Price, $1.00.

A book written for the instruction and guidance of those who go for pleasure to the woods. Its author, having had a great deal of experience in camp life, has succeeded admirably in putting the wisdom so acquired into plain and intelligible English.

FOREST AND STREAM PUBLISHING CO., NEW YORK

YOU know mallards—wisest and wariest of all ducks—Solomons of the air. You can't knock down mallards with a paddle nor can you get them with a gun that plasters its shots all over the face of creation.

A mallard shot is generally a long shot, and long shots require a hard-shooting, close-shooting gun.

That's why the long-headed man who goes to a mallard country takes a Lefever. When he swings it on a towering pair of mallards he does not question the result. He know it—

TWO CLEAN KILLS

The reason a Lefever kills clean and sure and far is **Lefever Taper Boring.**

But if you buy a Lefever for the taper boring alone, you will get more than your money's worth. For ins ance, you will never be handicapped with looseness at the hinge joint. The exclusive Lefever screw compensates for a year's wear by a trifling turn that you make yourself with a screwdriver.

LEFEVER SHOT GUNS

Sixteen other exclusive Lefever features and Lefever simplicity and strength make the $28 gun the peer of any $50 gun on the market. Upwards to $1,000. Send for free catalog and get Lefever wise.
LEFEVER ARMS CO., 23 Maltbie St., Syracuse, N.Y.

Du Pont Gun Club.

WILMINGTON, Del., Jan. 21.—Think of twenty-one full squads and some more who shot 25 just for fun. You can imagine how we are rushed between 2 P. M. and dark. We are going to enlarge the club house; in fact, we must. In all this year's talk about gun club organization don't you think that we have done our part.

Charity begins at home, and so does the gun club scheme. We have the whole town talking shoot, the enthusiasm is at fever heat, and we can keep it here, I think. The Eastern Handicap will be held during the week of July 17. Wait for something spectacular. We will have a handicap that will open the eyes of some of the boys.

The shoot was held at New Bridge to-day, and was witnessed by the largest attendance that ever assembled at a shoot in this State. About 1800, as compared with 1500 on the previous week. The three traps worked satisfactorily. The sensation of the afternoon was in the Coleman du Pont Merchandise event, Foord, Bush and Lobb tying on 25 straight. This tie will be shot off next week.

The ties that resulted in three classes on the Saturday previously were shot off. The winners were: Class A, J. A. McKelvey; Class B, Stanley Tuchton, and Class D, Dr. H. G. Buckmaster. All of the winners were awarded sterling silver spoons.

The complete scores of the shoot were:

L Evans	19	Lobb	25
R B Evans	12	J Husbands	14
Nealy	10	H G Buckmaster	16
Bush	25	S C Rumford	19
Turner	18	L Rumford	22

Farrow	4	S Lindsey	14
C Buckmaster	19		

Considerable interest was manifested in the revolver and pistol qualification scoring at 50yds. In this class there were six entries. K. K. V. Casey was high man with a score of 88, 86, and 76.

Revolver and pistol qualification scores, 50 yds.: K. K. V. Casey 88, 86, 76; L. du Pont 87, 83, 81; F. B. Harkins 80, 79; F. G. Robelen 70, 72; J. A. Ellison 72; John Bancroft, Jr., 66, 64, 64.

Revolver and pistol practice scores, 50yds.: L. du Pont 78; C. F. McCloskey 72, 55, 49; E. H. Lambert 57, 47, 37, 29; A. B. Richardson 44, 27; H. H. Ingram 57, 40.

Rifle practice scores, 50yds., .22cal.: C. W. Pierce 83, 79, 71.

The Gun of To-day.

LITTLETON, Ill., Jan. 16.—I was very much impressed with the article "The Gun of To-day," by W. Baden-Powell, as published in FOREST AND STREAM from Field, London. I think a further positive verification of the truth of wad retardation as a cause of the closer pattern in choke-bored guns, would be to bore a large number of small holes, say an inch (more or less), back from the muzzle to give an early exit to more or less of the pressure, the barrel from there on acting as a break or retardent to wad. Let some one try this out and report.

C. A. ZANDER.

Larchmont Y. C.

LARCHMONT, N. Y., Jan. 22.—Favorable conditions were a feature of the weather at the shoot of the Larchmonth Yacht Club to-day. Five special events afforded good competition for the contestants. F. E. Samson was a distinguished performer. He scored a leg on the January cup and 25 straight in a special contest. W. J. Elias scored a leg for the January cup, while G. L. Beady made a like win for the commodore's cup. F. Stead had a long handicap allowance and scored a leg for the Sauer gun:

Baudoinc cup, 25 targets, handicap:

			G G Hamil	1	20
W J Elias	3	25	E A Wilson	2	20
F E Samson	0	22	R Johnson	1	18
F Stead	6	24	W B Short	3	16
J G Bateman	2	20			
G L Bready	3	20			

Commodore's cup, 25 targets, handicap:

			J G Bateman	2	20
G L Bready	2	25	E A Wilson	2	19
R Johnson	1	24	F E Samson	0	19
F Stead	6	24	G G Hamill	1	15
W B Short	3	23			
W J Elias	2	22			

Sauer gun, 25 targets, handicap:

			W J Elias	2	21
F Stead	6	25	W B Short	3	21
F E Samson	1	24	G G Hamill	1	18
G L Bready	2	23	J G Bateman	2	11
R Johnson	1	23			
E A Wilson	2	23			

January cup, 25 targets, handicap:

			G L Bready	2	20
F E Samson	1	23	W J Elias	2	20
E A Wilson	2	22	G G Hamill	1	18
W B Short	3	22	R Johnson	1	17
F Stead	5	22			
J G Bateman	2	20			

Special match, 25 targets, handicap:

			G L Bready	2	22
F E Samson	0	25	E A Wilson	3	22
W J Elias	2	24	W B Short	5	21
G G Hamill	5	24	J G Bateman	5	18
R Johnson	2	24			
J R Colman	5	23			

Ten targets, scratch

F E Samson	9	W J Elias	7
F Stead	9	W B Short	7
E A Wilson	9	G G Hamil	4
R Johnson	9	J G Bateman	5
G L Bready	7		

Fifteen targets, scratch:

W J Elias	15	R Johnson	12
G L Bready	15	E A Wilson	12
G G Hamill	13	W B Short	11
F E Samson	13	F Stead	10
J G Bateman	12		

Ten doubles:

F E Samson	12	G G Hamil	8
W J Elis	11		

High gun score:

F E Samson	112	E A Wilson	105
F Stead	111	G G Hammill	90
G L Bready	110	J G Bateman	88
W J Elias	110		

Montclair Gun Club.

MONTCLAIR, N. J., Jan. 21.—In event No. 1 Messrs. Boxall and Frazee each made a perfect score. Event No. 3, 25 targets, handicap, the third leg for the January cup, for members, was won by Cramer with 20 breaks and a handicap of 5, or a total of 25.

Event No. 4, a walking match, was won by Frazee with 6 breaks to his credit.

In the two pick-up team races Messrs. Bush and Frazee made the best showing with a score of 17 points out of a possible 20. Scores:

Boxall	10	11	3	22	5	19
Atwater	8	10	4	21	2	23
Bush	8	10	5	22	3	11
Frazee	10	11	3	23	6	12
Crane	..	11	4	25	3	18
Williams	..	8	..	..	3	..

Pick-up team race, 10 targets per man:

Event 6: Williams and Boxall 9; Bush and Frazee 17; Atwater and Crane 16.

Event No. 7: Williams and Boxall 10; Bush and Frazee 17; Atwater and Crane 17.

E. WINSLOW, Sec'y.

Claredon Gun Club.

SECAUCUS, N. J., Jan. 22.—Enclosed find scores that were made to-day at the grounds of the Claredon Gun Club, Secaucus, N. J. There were several individual matches shot between the members, and a team race between the Claredon Gun Club and the Hudson Gun Club, each club shooting four men at 100 targets each. The Hudson team won and carried off the honors with a margin of 22 targets, owing to the poor shooting of Frank Sommers, who was not shooting up to his usual form. He had the misfortune of his gun getting out of order, and having to use a strange one that did not fit him. He also shot a race at 50 birds with George Richards for a suitable purse, but Richards was a little too strong for him, and won out by 2 targets. A return match has been arranged to take place at an early date, when Frank says that he will show him something.

After the shoot all hands adjourned to the club house, where our host, Bodie, had prepared for us a steaming hot dinner that all hands did justice to, and while enjoying our cigars there were numerous hunting stories told, but when Fred Allen tried to tell us of the ten geese that he said that he killed with one shot at Barnegat, we all gathered up our coats and gun bags and wended our way to our homes to think it over.

The weather was cold, and with a stiff wind that was blowing across the traps, made shooting hard, which accounts for the low scores that were made. However, we will try again in a few weeks and try to improve

them; and we invite all trapshooters that want to take a crack at some white flyers from a good fast trap to visit the Claredon Gun Club grounds at "Snipe" Bodie's, Secaucus, N. J.

R H Bodie	20	21	18	15	21
F Allen	16	18	19	17	20
C Schonemann	14	19	20	18	19
F Sommers	11	15	18	12	15
J Whitley	15	20	22	20	19
G Richards	15	14	15	15	17
G Neary	16	14	17	17	17
T H Kelley	18	18	19	20	20
H J Burlington	21	1	919	20	19
Whitley, Jr.	..	..	..	10	9
Snipe, Jr.	..	..	..	10	12
R Burns	..	21	17	17	..

Team shoot, Hudson G. C. vs. Claredon G. C.:

Hudson G. C.		Claredon G. C.	
Whitley	77	Bodie	80
Kelley	76	Schonemann	65
Richards	69	Sommers	57
Neary	77—299	Allen	75—277

T. H. KELLEY.

Indianapolis Gun Club.

INDIANAPOLIS, Jan. 14.—Conditions to-day presaged low scores, but the general average was higher than usual. In practice Moller, Hillis and Lewis each had a 20 straight, and in the cup race Lewis broke the first 25. Moller, with 24, looked the contender, but in the last half both he and Lewis fell back, and F. Hillis won with 47 out of 50. All shooting from 16yds. except Moller, whose win last week put him back to 18.

Practice:

	Shot at.	Broke		Shot at.	Broke
Moller	110	96	Britton	60	32
F Hillis	110	99	Neighbors	60	37
J Hillis	110	88	Hymer	110	84
Lewis	110	101			

President's cup, 50 targets:

Miller	43	Britton	34
F Hillis	37	Neighbors	37
J Hillis	42	Hymer	32
Lewis	45		

Jan. 20.—A bad light and heavy fall of snow contributed to the low scores at the gun club yesterday.

In practice Hymer was best with 90 per cent. broken. In the third heat of the race for the president's cup Lewis and Dixon tied on 42 out of 50, and in the shoot-off at 25 Lewis won, 22 to 20.

Practice:

	Shot at.	Broke		Shot at.	Broke
Moller	135	90	Neighbors	60	33
Hymer	85	76	Dixon	135	98
Lewis	85	71	Britton	60	39

President's cup:

Moller	50	35	Neighbors	50	40
Hymer	50	41	Dixon	75	62
Lewis	75	64	Britton	50	40

Intercollegiate Indoor Rifle League.

Washington, D. C., Jan 21.—The Columbia University eam made the highest score in the week's matches of he Intercollegiate Indoor Rifle Shooting League. Six f the sixteen teams are tied for first place with two ictories and no defeats. The results of the week's natches are: Columbia defeated Dartmouth, 1859 to 570; Princeton defeated Minnesota, 1609 to 9 (by deault); Louisiana defeated California, 1448 to 0 (by deault); Massachusetts Aggies defeated Arizona, 1813 to 511; Purdue defeated North Georgia Aggies, 1642 to 556; Iowa defeated New Hampshire, 1855 to 1531; Cornell defeated Washington State, 1766 to 1758; Missouri tate defeated Rhode Island State, 1740 to 1618. New aven and Bridgeport retain the lead as a result of the th week's matches of the Interclub Rifle Shooting eague for the position as contesting team of the Eastn League to shoot against the winning team from the estern League for the indoor civilian rifle club team ampionship of the United States.

The PARKER GUN Again a Winner!

On January 11-13, 1911, The "OLD RELIABLE" PARKER GUN, shot by Howard D. Bates, of Ridgetown, Ont., again won the Grand Canadian Handicap at live birds, killing 25 straight and 9 in the shoot-off, from the limit distance of 31 yds. Mr. Bates shot at 54 birds during the tournament and killed them all. THIS IS SOME SHOOTING!

Marlin Big Game REPEATING RIFLES *Model 1893*

The Special Smokeless Steel barrel, rifled deep on the Ballard system, creates perfect combustion, develops highest velocity and hurls the bullet with utmost accuracy and mightiest killing impact.

The mechanism is direct-acting, strong, simple and perfectly adjusted. It never clogs. The protecting wall of solid steel between your head and cartridge keeps rain, sleet, snow and all foreign matter from getting into the action. The side ejection throws shells away from line of sight and allows instant repeat shots, always.

Built in perfect proportion throughout, in many high power calibers, it is a quick handling, powerful, accurate gun for all big game.

Every hunter should know all the *Marlin* characteristics. Send for our *free* catalog. Enclose 3 stamps for postage.

THE NARRATIVE OF A SPORTSMAN

INTER-OCEAN HUNTING TALES

EDGAR F. RANDOLPH

A series of hunting reminiscences of rare charm for the sportsman and for the wider circle which delights in true tales of outdoor life. With none of the high coloring and exaggeration which give a false note to so many hunting stories, Mr. Randolph's book is never lacking in interest.

He covers the field of sport with the rifle, east and west, drawing a vivid word picture of life in the open, subordinating his own exploits to the main incidents of outdoor experience, giving much valuable information on camp life, hunting and the habits of wild game, and continually delighting the reader with the freshness of his viewpoint.

This book will strike a sympathetic chord in the memory of every big-game hunter of experience and will prove of real value to the novice who is planning an excursion into the wild.

Cloth, 170 Pages. Richly Illustrated. Postpaid, $1.00.

FOREST AND STREAM PUBLISHING COMPANY, 127 Franklin Street, NEW YORK

DU PONT DU PONT

"Amateurs Shoot the Powder They Prefer"

THE OFFICIAL RECORDS

on single targets for 1910 show the following high amateur winners:

1st—J. S. DAY, Midland, Texas 4164x4280—97.28%
2d—F. S. WRIGHT, South Wales, N.Y. 1977x2055—96.20%
3d—J. R. GRAHAM, Ingleside, Ill. 5721x5970—95.82%

Mr. Day shot BALLISTITE and "INFALLIBLE" in making these scores with the exception of one tournament. Eliminating his score at that shoot, his average would be 97.39%.

Messrs. Wright and Graham shot DU PONT Powders exclusively in making the above scores.

AMERICAN BIG GAME IN ITS HAUNTS

Boone and Crockett Club Series

Edited by GEORGE BIRD GRINNELL

An invaluable work not alone for the sportsman, but for the student and lover of wild life. Treats of big game preservation and protection in the broader sense; tells of the habits, habitat and life history of the larger wild animals; touches upon the problem of the public forest domain, and is rounded out by interesting hunting reminiscences by such leaders in the fraternity of big-game hunters as Madison Grant, Paul J. Dashiell, George Bird Grinnell, Jas. H. Kidder and W. Lord Smith. Bound in cloth, library edition, heavy paper, richly illustrated, 497 pages.

Postpaid, $2.50

COMMISSIONER BOWERS' REPORT.

Continued from page 142.

over a larger territory, temporary collecting stations have been located at Caruthersville, Mo., and Rosedale, Miss., which will be made permanent auxiliary stations if experience proves favorable. It is believed that similar inexpensive stations can be advantageously established at various points on the Mississippi River from New Orleans to St. Paul, as the field for this work is extensive and the number of fish that can be economically reclaimed from the drying sloughs and lakes is governed only by the amount of money available for the purpose.

Although the propagation and general distribution of carp was discontinued many years ago, the Bureau constantly receives applications for this fish, and in instances where the waters described are unsuited to other species, the requests are complied with by transferring carp from other waters.

After nearly forty years of endeavor to establish the chinook salmon of the Pacific coast in waters of the United States where it is not indigenous, conclusive evidence of success in one instance has come to hand. Within the past year it has been ascertained that the species has become established in Lake Sunapee, New Hampshire, where numerous specimens from three to five pounds in weight have been taken by anglers. This is undoubtedly the result of a plant made in 1904 by the New Hampshire Fish Commission, the eggs having been supplied from the Bureau's hatchery at Baird, Cal. Encouraged by the outcome of this experiment, the Bureau made a plant of 40,000 fingerling chinook salmon in Lake Champlain in the spring of 1910.

There unquestionably has been an increase in Atlantic salmon in the Penobscot River, as evidenced by the results of the Bureau's operations in 1910 compared with 1908 and 1909. Though receiving the catch of a smaller number of weirs the past season, the collection of spawning fish was twice as great as in 1909 and 60 per cent. greater than in 1908.

It is believed that owing to the planting of the species by the Bureau, pike perch have become sufficiently abundant in the St. Lawrence River to warrant the collection of eggs at the Cape Vincent station, and plans will be made accordingly.

It is again urged that provision be made for the establishment of additional stations for the rescue of fishes from overflowed lands in the Mississippi Valley. Millions of fish now annually left by the receding waters to die of exposure can by this means be saved at small expense.

The Bureau is of the opinion that a highly important work of the near future will be the stocking of ponds and streams on the farms of the country with hardy species of fish requiring little care or attention and omnivorous as to diet. The several species of catfishes appear to fulfill the requirements more completely than any other fish. They will grow in sluggish and muddy water, they are very tenacious of life, their diet is of wide variety, and as food they are excelled by but few fresh water fish. While some of the smaller species can be made important additions to the home food supplies of the farms, certain others, particularly the larger ones, are already the basis of important commercial fisheries. For the propagation of both kinds the establishment of a station at some

point in the lower Mississippi Valley, preferably near Morgan City, La., is regarded as highly desirable.

The fishcultural work in Yellowstone Park has been conducted heretofore with inadequate means as an adjunct to the operation of Spearfish Hatchery, but it is believed that the opportunities in the national park are such as to warrant an independent station. One of the chief difficulties encountered in the efforts to replenish the depleted fisheries of the United States arises from the lack of control over the fishes after they are planted and the neglect of certain States to make provision for their protection. Yellowstone Park, being under federal jurisdiction, offers an exceptional opportunity to demonstrate the possibilities of fish culture under rational and consistent regulations.

TRADE IN BIRDS' NESTS.

THE bird's nest industry forms a singular item in the export trade of Siam, and according to the Journal of the Royal Society of Arts the shipments during the fiscal year 1900 amounted to 17,781 pounds, the value of which was £22,000.

Most of the nests went to China, Hong Kong and Singapore. The value of the nests lies in the fact that they are edible, though we confess we have never had the opportunity of tasting one. They are found in the islands off the coast of Siam and are the products of a species of bird belonging to the swift tribe and consist chiefly of the salivary secretions of these birds, whose salivary glands are much more developed than those of the ordinary swift.

The nests are gathered from April to September. The female bird takes the leading part in the construction of the nest, though some assistance is occasionally rendered by the male. The first nest takes about three months to construct and it is taken before the eggs are laid in it. Another nest is at once commenced which is finished in about thirty days.

Last of all the birds begin a third nest, over which they spend about three months and in which they are allowed to rear their young. When the brood has flown, however, this nest also is taken. The nests taken at the beginning of the season are considered the best in quality. By the Chinese, who consume these nests, they are thought a great delicacy and are said also to have valuable tonic properties.—Engineering.

WHALE STRANGLED ITSELF.

THE crew of a cable repairing ship working in the Pacific recently brought back a remarkable story of a whale.

The vessel in question had been sent north along the coast of Alaska to repair the cable, because during the last winter difficulty had been experienced in sending and receiving messages. The ship picked up the cable connecting Valdez and Sitka some miles off Cook Inlet, nor far from Sitka. The crew never had such a time hauling a cable on board as they did that day on the Alaska Coast. Finally the cause of the great weight was made known.

Some time during the winter a whale, feeding on the bottom of the ocean, with wide open mouth, collided with the wire rope. Unable to shake the big wire from the mass of whalebone in its jaws, the big mammal "turned turtle," rolled over once, turned around, rolled again and dived.

In these few movements the fish proved himself his own hangman, for the cable was twisted tighter about the head of the whale than any man could have twisted it with the most powerful machinery. The whale drowned, and the carcass was devoured on the bottom of the ocean by fish. The crew of the cable ship hauled up an immense load of whalebone, and found a great twist in the Government cable that had been the cause of the unusual difficulty in sending messages to and from either end of the rope.—New York Fishing Gazette.

SMITH GUNS
HUNTER ONE — TRIGGER

THE mechanical precision of the adjustment of a Hammerless Smith Gun approximates perfection. By reason of it a Smith Gun cannot shoot loose. The longer you shoot it the tighter it gets. And so by far the greater number of your gun-troubles are eliminated.

NEVER in the long history of gun-making has there been made so great an improvement as the *Hunter One-Trigger attachment*, which can be put on all Smith Guns. It stands for the greatest accuracy—and is helping to make world's records. Your dealer should be able to tell you all about it. So will our new and handsomely lithographed Catalogue, which you may have on request.

The latest product exemplifying Smith Gun perfection is our *20-Gauge Hammerless*—just out—and almost as light as a feather. In reality it weighs from 5¾ to 7 lbs. It shows what can be done in making a fine gun at a low price. It is simply *all gun and no frills.*

ANGLING MEMORIES

Seasonable Books for the Sportsman's Library

MEN I HAVE FISHED WITH — MY ANGLING FRIENDS

Both by FRED MATHER

These two volumes are a source of endless delight to the fisherman. They deal with every phase of the gentle sport from bent pins and willow poles to salmon flies and special rods—with every kind of fish as well.

They are full of a quaint philosophy, written with a rare appreciation of human nature, and comprising sketches of angling "characters" as well as well-known men who were Mr. Mather's brethren of the angle. Much of other sport and adventure beside fishing will be found between the covers of these books. These two large, splendidly bound, splendidly printed, and richly illustrated volumes of 400 pages each regularly sell for $2 each. While they last we offer

Both together, postpaid, for $3.00

His Best Book

MY FRIEND THE PARTRIDGE

By S. T. HAMMOND

This delightful presentment of the glories of Autumn days with gun and dog in the crisp New England woods in search of the noblest of native game birds, which has already delighted thousands of readers of FOREST AND STREAM, is now ready for delivery in book form.

Mr. Hammond knows his upland coverts as no other writer of the day. He makes no empty boast when he calls the partridge his friend, and, moreover, makes his every reader a friend of this splendid bird. He succeeds in a rare degree, not only in describing the ruffed grouse, its habits and habitat, and the pleasures of its pursuit, but in surrounding his reader with the very atmosphere of the leaf-scented Autumn woods. Mr. Hammond's book is a welcome addition to the library of sport.

Nursing vs Dosing.

A Treatise on the Care of Dogs in Health and Disease. By S. T. Hammond ("Shadow"), Author of "Training vs. Breaking." 161 pages. Cloth. Price, $1.00.

Mr. Hammond believes that more dogs are killed by injudicious doctoring than by disease, and the present work is a protest against the too free use of medicine when dogs are sick. The author has given especial attention to many of the troubles which especially afflict small dogs kept in the house, and likely to suffer from lack of exercise and from over-feeding; and boys and girls owning dogs—as well as children of larger growth—may profitably study and ponder this volume.

Contents: Importance of Nursing. Cleanliness. Out-of-Sorts Dam. Puppies. Diet. Other Foods. Kennel and Exercise. Common Ailments. Teething. Diarrhea. Convulsions. Epilepsy. Distemper. Eczema. Need of Proper Care. Sour Stomach. Vermin. Canker of the Ear. Mange. The Nervous System. Abscesses. Colic. Worms.

A Problem's Solution

LOG CABINS & COTTAGES; How to Build and Furnish Them.

A seasonable book when all minds are bent on the problem of getting close to nature. Mr. Wicks in this delightful book offers timely advice to every one who wants to build a simple summer home at one with its surroundings of wood or stream or shore.

This is a thoroughly practical work, treating of the how, the where, and the with what of camp building and furnishing. It is helpful, too, in regard to furnishing, and withal a most beautiful work.

Cloth, profusely illustrated, $1.50 postpaid.

FOREST AND STREAM PUBLISHING CO.

—two to a wagonload!

This isn't from a "fish" story but from a fact story, told by a man who knows what he's TALKING about—so beautifully written and pictured that you are no true sportsman if it does not make your "mouth water" to be in the wonderful game country it refers to. The

Gulf Coast Country of Texas

offers you now the kind of fishing and hunting that makes the longest trip worth while. Wild fowl are so plentiful that it is a poor marksman indeed who cannot bag the "limit" in a single day, when the season is on. And there are deer—MANY of them, and even bear! There are wild turkeys, plover, Jacksnipe and the dangerous wild hog. And fish!—the mighty tarpon, mackerel by the millions, and the best of sea bass fishing anywhere. If you are interested in a REAL game country, you will be interested in our superbly printed book that tells you all about it—a heart to heart talk to all sportsmen, illustrated with 50 photographs, that will hold your interest from first page to last. Please write today for free copy.

PLANNING A HOUSEBOAT

Will be a leisure-hour occupation in many a family this winter. Houseboating has come among us to stay, and promises to be even more popular than in England itself. Every one who is interested in houseboats or who contemplates taking up this feature of outdoor life, should read Mr. Albert Bradlee Hunt's practical, and, at the same time, beautiful work on the houseboat and its adaptation to American waters.

HOUSEBOATS AND HOUSEBOATING

Covers the entire range of its title, considers the use and opportunities of the houseboat; their relation to city and suburban life; construction, furnishing, motive power, and all the thousand and one details, the knowledge of which spells the difference between success and failure in houseboat building and houseboat life.

Details, plans, drawings and specifications illuminate the text, while life on houseboats is interestingly described. Some of the more noted English and American houseboats and the life thereon are also described at length with illustrations. Buckram, heavy paper, sumptuously illustrated.

AMERICAN BIG-GAME HUNTING

BOONE AND CROCKETT CLUB SERIES

Edited by George Bird Grinnell and Theodore Roosevelt

A thoroughly stimulating book dealing with American big-game hunting, East, West and under the Arctic circle, including every phase of sport with the rifle. "American Big-Game Hunting" is a compilation of the experiences of some of the most widely known sportsmen in America. Among the sketches are: The Story of the Buffalo, Capt. Geo. S. Anderson; The White Goat and His Country, Owen Wister; Old Times in the Black Hills, Gen. Roger D. Williams; Coursing the Pronghorn, Theodore Roosevelt; After Wapiti in Wyoming, F. C. Crocker; In Buffalo Days, George Bird Grinnell; Blacktails in the Bad Lands, B. Rumsey.

Forest Preserves and Game Refuges are also considered. Aside from the surpassing interest of the narratives, the book is invaluable for reference. Cloth, heavy paper, library edition, richly illustrated.

Postpaid, $2.50

WESTLEY-RICHARDS
ENGLISH GUNS

Westley-Richards' guns are hand-made throughout. The lowest priced weapon is a well constructed, reliable shooting gun that any sportsman may be proud to own. The higher priced weapons, which, besides being the finest shooting guns it is possible to produce, are through their workmanship, external beauty and intrinsic merit, works of art, standing in a class by themselves, each one a masterpiece of modern gunnery.

HAND DETACHABLE LOCKS

The invention enables sportsmen to take out the locks for cleaning and oiling without moving a single pin. Simply detach fore-end and bottom plate by hand and the locks can be lifted out and as easily replaced. Extra pairs of locks can be supplied to interchange in the event of a possible accident, or where a different weight of pull is wanted.

NEW PATENT IMPROVED RELIABLE ONE-TRIGGER MECHANISM.

Westley-Richards' one-trigger mechanism does not balk nor double; it is not frictional; cannot be upset by recoil; and always acts the same. Perfect selective action, firing either right-left or left-right, or as many rights or lefts first as may be desired at the will of the shooter.

One-Trigger mechanism is supplied on the higher grade Westley-Richards Guns.

GUNNER GUMPTION'S
LANTERN LECTURETTES ON

GREENER GUNS

The Greener Tumbler Bolting Safety.—Of course you are convinced that the Greener Side safety is a sine qua non of the perfect gun, yet to make assurance doubly sure your gun should be fitted with an internal or "tumbler bolting" safety, operated automatically and entirely independent of the shooter's volition. A safety that will safeguard the user of the gun and his companions against all risk of accidental discharge.

The Greener Tumbler Bolting Safety is almost human in its ingenuity, yet consists of but two limbs operating in such a manner that it is a mechanical impossibility for a Greener gun fitted with this safety to be fired unless the triggers are actually pulled Should the locks by any mischance jar out of bent, the "silent sentinel" checks the fall of the tumbler instantly and effectually. Should the tumbler through dirt or other cause fail to go properly into bent, the safety prevents its fall upon the cap. When the trigger is pulled voluntarily, a projection of the trigger blade depresses the rear end of the Safety, lifting it clear of the tumbler's path and permits the gun to be fired in the usual manner

Look at the drawing, it explains the simple working of the device exactly; of course you will have this safety fitted to your new Greener gun. *Catalog free.*

VOL. LXXVI. No. 5, Feb. 4, 1911
Price 10 Cents

IF YOU DID NOT READ THIS GUNSMITH'S LETTER LAST WEEK, DO IT NOW.

It's from a shooter, who is also in the gun business —a man who knows what he is talking about.

"Now to start off, I will frankly admit that I am one of those many gun cranks. I am a gunsmith by trade. I have shot and owned every make of gun shipped in and sold in the South for the past several years. A short time back I purchased one of your No. 520 Pump Shotguns. I bought this gun more through curiosity than anything else, not having the slightest idea of discarding my old gun. I took it to my shop, took it apart to see the mechanism, and the further I went with my investigation, the better it pleased me. I then tried it out in the field thoroughly for pattern, penetration and smoothness of operating. (Now right here I camped.) I want to say that I have never seen its equal. This gun handles with at least from one-third to one-half less friction than any Pump I ever operated. The mechanism is perfect; the finish is the best on any Pump I ever saw. The outlines and balance to my shoulder and eye are more than I ever expected to get in any slide action gun.

"Now, gentlemen, this is something a little out of my line, as it is the first of the kind for me. I am no man to condemn any gun. Give the poorly manufactured guns their just dues, as they will have hard enough time at the best. But I do think when a gun company comes to the shooter with something like you have just put out in this gun, it is time to compliment it —so I just had to pop off. Keep the good work going.

"One more word, please, and I will let you rest. I had in my gun case quite a lot of condemned shells that had been carried and worked through the magazine of other guns until they became so bad that I could not use them in the other guns. I intended giving them to some double-gun man, as I thought they were worthless to me. I run some of them through this gun of yours and could not find one that gave trouble, so I took them out on my last quail shoot and used them with perfect satisfaction and good results. This feature alone is great and has given me lots of trouble heretofore."

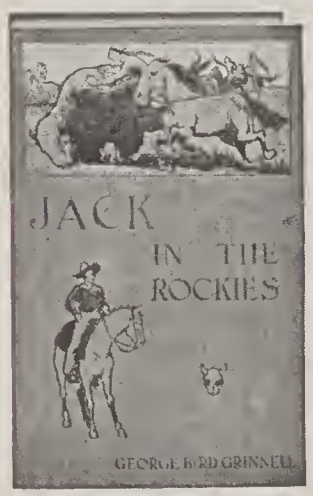
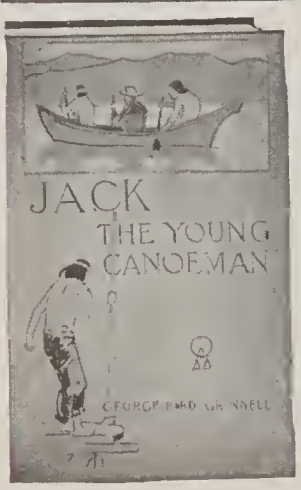
THE JACK SERIES

Best Books For Boys

By GEORGE BIRD GRINNELL





THE solution of the parents' problem of providing for the growing boy reading at once healthy and satisfying to his craving for action and adventure. In the Jack Books the longing of the normal boy for Western stories is gratified, the interest is absorbed and the mind is unconsciously led to phases of life that are elevating and instructive.

The books are the story of a young New York lad, sent to Stillwater ranch in the Rockies for his health, who becomes the companion of a veteran of the frontier. For each of six succeeding years he is led through new territory and experiences, accumulating much of the lore of plain and mountain, enriched with tales of the old West.

Ranch life, travel and hunting on the lonely plains, Indian camps, mountain climbing, trapping and canoeing are described. There is not a dull page, and the author manages to put much of the spirit of the West into his books. Jack is a real boy, and the books are stories for live boys—not lectures in disguise.

GAME FARMS.

As usual, we see in all that concerns the production and preservation of game a marked difference between the methods in vogue in England and the sister countries, and those—if any there be—peculiar to Ireland. I say "as usual," by which I mean there is nothing out of the common in all this; we merely see two conditions before us, how to do it and how not to do it. We in Ireland seem to have a liking for the last-named; our friends across the water prefer ways and means that lead to success. A scamper through Ireland and another through England and Wales shows this fully; it is not necessary to extend your journey north of the Tweed, but you can do so if you like, and you will thereby secure additional testimony to the mass of evidence already obtained, showing conclusively the state of lethargy we are in in Ireland, and how spruce and up-to-date our neighbors of the other side are.

Now, among the rural industries of England must be included game farming—chiefly, I admit, in the shape of pheasant rearing, but not exclusively so. England comes first, but gallant little Wales has two or three flourishing game farms; Scotland has some too—I don't know how many—but I do know that Ireland has none. Though I did not start out to discuss piscatorial matters, I may just here remark that there are plenty of "fish farms" (if I may coin an expression for once) in England also, all serving, like the game farms, a useful purpose, and all likewise good paying ventures from a commercial point of view. Failures are not understood by our Saxon neighbors, and they see to it that such disappointments do not come to them.

Some time ago an expert in pisciculture and piscatorial matters generally paid a flying visit to Ireland, and had a look at the country's inland fisheries and angling resorts. In subsequent interviews and correspondence which I had with him, he said he had seen no country like Ireland for an angling paradise, but that all our rivers and lakes needed restocking by the introduction of new blood, and so on. As an expert, and living by the practice of his calling as a pisciculturist, he proposed to stay a short time in this country, interview the riparian and other fishery owners, and offer his services. In making this offer he was only doing what he had so successfully done in the sister countries. But he didn't know Ireland nor her sons; the last-named were interested, said it ought to be so, quite approved of the project, but not a man in Ulster, Munster, Leinster, or Connaught would take him by the hand and authorize him to make an effort to put our lakes and rivers in trim in the interests of Irish anglers. So he shook the dust, or rather mud, from his feet, returned whence he came, and continued the good work among those capable of understanding and appreciating it at its right value. Here, then, is a fair sample of how not to do things, and it aptly applies to ourselves in old Ireland. The general result is to be seen when we compare a mile of the Liffey, Lee, Boyne, or Blackwater with a mile of the Itchin, Test, Wye, or Derwent. Personally, I have fished the whole eight of them, and the less said about the first four—in comparison with the last four—the better.

However, to return to game farms, flourishing institutions every one of them, which would hardly be the case if they did not cater for a well-established demand, we find them scattered over England principally, with here and there one in Wales and Scotland, and all paying up to the hilt. Among the many I have from time to time visited is one in Hampshire, so well known as scarcely to need naming. As already said, pheasants are the chief game birds actually reared, but other game is to be had through such agencies. At all events, many an estate is set going, many a depleted one is renovated, and many a "shot out" property restocked by such institutions, or, if you prefer to be extra particular, through their instrumentality, other factors being called upon to help.

PLANNING A HOUSEBOAT

Will be a leisure-hour occupation in many a family this winter. Houseboating has come among us to stay, and promises to be even more popular than in England itself. Every one who is interested in houseboats or who contemplates taking up this feature of outdoor life, should read Mr. Albert Bradlee Hunt's practical, and, at the same time, beautiful work on the houseboat and its adaptation to American waters.

HOUSEBOATS AND HOUSEBOATING

Covers the entire range of its title, considers the use and opportunities of the houseboat; their relation to city and suburban life; construction, furnishing, motive power, and all the thousand and one details, the knowledge of which spells the difference between success and failure in houseboat building and houseboat life.

Details, plans, drawings and specifications illuminate the text, while life on houseboats is interestingly described. Some of the more noted English and American houseboats and the life thereon are also described at length with illustrations. Buckram, heavy paper, sumptuously illustrated.

"THE SMALL YACHT"

By EDWIN A. BOARDMAN

THE author, who has large personal experience in designing and sailing small yachts, being the winner of the Seawanhaka cup in 1905, deals with the entire subject of handling racing boats in language that is readily understood by the youngest amateur. There is nothing which makes for success in small boat racing, from tuning up to jockeying, left out. Part One deals with preparing the boat for the race, while Part Two enters into every detail of handling under every condition, with notes on American and foreign racing, expense, equipment, winter care, sailing conditions, types, etc. Altogether it is not only the latest, but the best work on the subject—invaluable for the enthusiast. Cloth, 46 plates from photographs, 18 diagrams, 24 plans.

Postpaid, $2.13

ANGLING MEMORIES

Seasonable Books for the Sportsman's Library

MEN I HAVE FISHED WITH — MY ANGLING FRIENDS

Both by FRED MATHER

These two volumes are a source of endless delight to the fisherman. They deal with every phase of the gentle sport from bent pins and willow poles to salmon flies and special rods—with every kind of fish as well.

They are full of a quaint philosophy, written with a rare appreciation of human nature, and comprising sketches of angling "characters" as well as well-known men who were Mr. Mather's brethren of the angle. Much of other sport and adventure beside fishing will be found between the covers of these books. These two large, splendidly bound, splendidly printed, and richly illustrated volumes of 400 pages each regularly sell for $2 each. While they last we offer

Both together, postpaid, for $3.00

Protection of the Yellowstone National Park, George S. Anderson. The Yellowstone National Park Protection Act. Head Measurements of the Trophies at the Madison Square Garden Sportsmen's Exposition. National Park Protective Act. Price, $2.50.

Modern Sporting Gunnery.

Written by the well-known English gun expert, Mr. Henry Sharp, and contains 525 pages and many illustrations. It tells of the various makes of guns and rifles, beginning with the early days of the art up to the present time. It deals with the subject of mechanism, boring, effect of different loads, and gives the results of scientific experiments. It tells "why" in entertaining and easily understood language, and is a book every lover of gun or rifle should have in his library. Cloth bound. Postpaid, $1.70.

Hunting Without a Gun.

And other papers. By Rowland E. Robinson. With illustrations from drawings by Rachael Robinson. This is a collection of papers on different themes contributed to Forest ann Stream and other publications, and now for the first time brought together. Price, $2.00.

My Friend the Partridge.

S. T. Hammond. An inimitable study of the noblest of our game birds,following the ruffed grouse deep into his haunts, detailing the experiences of more than 60 years in the field, throwing much light on the habits, life history and habitat of the game. A most delightful reminder of happy days with upland game. Cloth, 150 pages. Postpaid, $1.00.

Inter-Ocean Hunting Tales.

Edgar F. Randolph. A collection of stories such as are told about the camp-fire. Mr. Randolph offers a hunting experience bounded only by the two oceans, replete with incident, interesting from its novel viewpoint and dealing with every kind of game that falls to the rifle of the American sportsman. Cloth, 200 pages. Postpaid, $100.

Camp Life in the Woods.

And the Tricks of Trapping and Trap Making. W. Hamilton Gibson. Containing hints on camp shelter and bait receipts of the trapper, the use of the traps, with instructions for the capture of all fur-bearing animals. Illustrated. Cloth, 360 pages. Price, $1.00.

Jack, the Young Ranchman;

Or a Boy's Adventures in the Rockies. By George Bird Grinnell. Illustrated. Cloth, 304 pages. Price, $1.25.

Jack Among the Indians;

Or a Boy's Summer on the Buffalo Plains. By George Bird Grinnell. Illustrated. Cloth, 301 pages. Price, $1.25.

Jack in the Rockies;

Or a Boy's Adventure With a Pack Train. By George Bird Grinnell. Illustrated. Cloth, 272 pages. Price, $1.25.

Jack the Young Canoeman.

George Bird Grinnell. Illustrated. Cloth, 286 pages. Price, $1.25.

Jack the Young Trapper.

George Bird Grinnell. Illustrated. 278 pages. Price, $1.25.

Manual of Taxidermy for Amateurs.

C. J. Maynard. A complete guide in collecting and preserving birds and animals. Illustrated. New edition. Price, $1.00.

My Sixty Years on the Plains, Trapping, Trading and Indian Fighting.

W. T. (Bill) Hamilton. The author was the last survivor of the old race of free trappers. Bill Hamilton was born in 1825, and was on the plains in 1842, trapper, Indian fighter, sign talker, trader, scout and guide so long as the old West survived. This book is the simple unaffected story of his adventurous life, more thrilling and full of personal interest than any romance. Cloth. Illustrated, 223 pages. Postpaid, $1.50.

Nursing vs. Dosing.

S. T. Hammond. A most practical book for the dog fancier, based largely on Mr. Hammond's observation that dogs, and particularly house dogs, suffer from too much medicine. Contents: Nursing, Cleanliness, Diet, Other Foods, Kennel and Exercise, Common Ailments, Diarrhea, Convulsions, Epilepsy, Distemper, Eczema, Need of Proper Care, Stomach, Vermin, Earl, Mange, Nervous System, Colic, Worms. Cloth. Illustrated, 161 pages. Postpaid, $1.00.

Rhymes of the Stream and Forest.

Frank Merton Buckland. A charming collection of verse by an author who knows and loves nature well. A particularly pleasing gift for fishermen, closely simulating in form and ornamentation the standard fly-book. Cloth. Heavy laid paper. Sumptuously bound. Postpaid, $1.25.

The Still-Hunter.

Theo. S. Van Dyke. A practical Treatise on Deer-Stalking. Extra cloth, beveled, 350 pages. Price, $1.75.

Log Cabins and Cottages.

William S. Wicks. This book covers building for the woods from the simplest shelter to the most elaborate cottage, cabin or house, and their furnishing and fitting. The details and directions are at once simple and comprehensive, and the illustrations are numerous and illuminative. Cloth. Illustrated, 44 full page plates and numerous text illustrations. Postpaid, $1.50.

The Angler's Workshop. Rod Making for Beginners.

Perry D. Frazer. A complete, simple and thoroughly up-to-date work for the guidance of the amateur rod maker, carrying him from first principles through all phases of successful rod making. There is no theorizing or speculation. All terms are simple, and all kinds of rods and woods are treated of. Cloth, 180 pages. Four full-page illustrations, 60 working drawings. Postpaid, $1.

The Book of the Black Bass.

James A. Henshall. The standard work on the black bass, comprising a complete scientific and life history of the black bass, together with a practical treatise on angling and fly-fishing, a full description of tackle and implements, and general observations. Cloth. Illustrated. 470 pages. Postpaid, $3.00.

Men I have Fished With.

Fred Mather. Sketches of character and incident with rod and gun from childhood to manhood; from the killing of little fishes and birds to a buffalo hunt. Illustrated. Price, $2.00

My Angling Friends.

Fred Mather. A Second Series of "Men I Have Fished With." Cloth, 369 pages, with 13 illustrations. Price. $2.

Training vs. Breaking.

Practical Dog Training; or, Training vs. Breaking. By S. T. Hammond. To which is added a chapter on training pet dogs, by an amateur. Cloth, 165 pages. Price, $1.00.

How to Build a Skipjack.

Complete plans and instructions for building a light draft sloop. Plans and directions easily followed. Cloth. Illustrated. Postpaid, $1.00.

How to Build a Knockabout.

A wholesome boat for all-around cruising and racing; 32ft. O. W., 10ft. beam, 26in. draft. Full working plans and drawings, with instructions for building. Cloth. Illustrated. Postpaid, $1.00.

FOREST AND STREAM PUB. CO., 127 Franklin St., New York

No. 6 KEEPING POSTED

1. As you read Forest and Stream through each week, you are frequently reminded of one thing or another that you desire to purchase. Such and such must be supplied to make your Shooting, Fishing, Camping or Cruising outfit complete.
2. Possibly you need waterproof shoes, or waterproof clothing. Or a new tent? It is your intention to take a much longer trip this time, than usual. And you may be located where you do not have access to sporting goods houses where all of your wants can be filled. In fact, even the best of us are often in doubt when it comes to knowing **where** to get the **thing** we want at the **right** price. You wish you had a friend at your elbow to suggest.
3. **Our** experts are right at your elbow. It does not cost you a penny (except your postage) to take advantage of their knowledge. They know **where** to **buy** and **how.** It is their business —and your advantage.
4. Glance carefully over our advertising columns. If you don't see what you want, write in to our Information Department. You will receive a full detailed reply—post haste—we're always on the job.

Isn't this worth while, if for no other reason than to get the **right** information on **how** to reach your destination by the quickest and surest routes—what railroads or steamship lines to take?

Don't put this off. Co-operate with us by telling your relatives and friends, what we can do for them.

Keep posted. Write to

Life and Sport in Labrador

NAPOLEON A. COMEAU.

In "Life and Sport on the North Shore of the Lower St. Lawrence and Gulf," Mr. Comeau has made a valuable addition to the literature of rod and rifle—and more. It is a book of engrossing personal interest to the sportsman or general reader, and of rare value to the student of wild life.

The author describes the events and experiences of fifty years, spent in the cause of humanity and science in one of the most interesting and least known sections of Canada. He writes as one sportsman to his fellows, detailing his experiences with the wild things of wood, shore and sea, with plenty of stirring experiences with big game and gamy fish.

Illustrated, 450 pages. Paper. Postpaid, $2.50.

FOREST AND STREAM PUBLISHING CO.

My observations in this connection are prompted by certain inquiries that have reached me during the last week or two as to the prospects of success awaiting such an undertaking in Ireland. Much as I would like to give an opinion, I must pause before doing so. Ireland is a funny place to start anything new in. A long time must elapse before any new idea becomes established. Our farming methods are all wrong according to English ideas, but, although during the last half century there have been innumerable attempts by our English friends to teach us the latest things in agriculture, we have somehow failed to catch on. Some years ago a very eloquent gentleman, check-suited, clean-shaven, and wearing an eyeglass, came over to teach the sons of Erin how to farm; but they threw him in a bog-hole down Tipperary way, and his proposed book, "Tips for Tipperary," has not yet seen the light of day. In fact, the last state of that man was worse than the first—very much so; and he too shook the dust, or scraped the mud, off his august person, hoisted his eye-glass, and returned to the seclusion of Piccadilly. Game farming, however, may not be fraught with such perils, and perhaps with our new race of tenant proprietors on the land some share of attention may yet be given to it. Pheasants might pay as well as flax, and they might not. —D'Arcy I. Hamilton, in the Shooting Times.

MONSTERS OF OLD REPRODUCED.

THE latest attraction at Carl Hagenbeck's famous animal park at Stellingen, near Hamburg, is a series of wonderful and striking lifelike representations of the great monsters that inhabited this earth in the distant past. In all. some thirty have been erected, but more are to follow, until we have a complete prehistoric zoo, says Professor Shepstone, in the Strand.

These weird beasts of the past rightly occupy a portion of the grounds to themselves. They have been built up of cement by a well known Continental animal sculptor, J. Pallenburg, around the shores of a delightful little lake, some three acres in extent. The animals are depicted standing by the water's edge, amid the shrubs and trees, while in the lake itself are shown huge crocodiles and strange looking creatures, half fish and half mammal. Additional realism is added by representing a few of the beasts in the act of battling with specimens of their kind.

There are several representations of the dinosaurs, or "thunder lizards," including the iguanodon, which towers some twenty-five feet into the air, making the trees around look quite small; the diplodocus, whose length of sixty feet and height of eighteen feet render the modern elephant a mere pigmy; the stegosouraus, with its bony plates on its back and spikes on its tail; the triceratops, with its three horns on its face and huge collar of spikes around its neck; as well as representations of the sloth, dodo and mammoth. Then we have huge flying reptiles, with an enormous spread of wings; birds with formidable teeth, not to mention giant lizards, tortoises and toads, compared to which the present living specimens are, in size, no more than a dog to a cart horse. Some of these tortoises and toads are twelve feet and more in length.

HUNGARIAN PARTRIDGE IN MAINE

THE Hungarian partridges which were introduced in the vicinity of Portland a year ago last spring have thrived and propagated.

G. S. Ellis, who was instrumental in bringing about the introduction of these birds in Maine, states that he has been investigating the matter during the past two weeks and finds the prospect in the vicinity of Cape Elizabeth very encouraging. He has talked with many men on different parts of the Cape who have seen at different times throughout the summer and fall flocks of from eight to twenty-five of the partridges.—Portland Press.

Book Exchange.

Advertisements of old books which are out of print, or of second-hand books, for sale, exchange or wanted, will be inserted in FOREST AND STREAM at 13 cents a line, 7 words to the line, 14 lines to the inch.

Specially arranged according to the directions of an experienced kennel manager. Full printed headings for receipts, experience, data, etc. Ruled pages. Memoranda spaces. The most complete and handy small kennel record yet devised. Smooth, heavy paper, 100 pages, 6½×4. Cloth covers.

Postpaid, 80 cents.

FOREST AND STREAM PUBLISHING CO.

HITTING vs. MISSING.

By S. T. Hammond ("Shadow"). Cloth. Price, $1.00.

Mr. Hammond enjoys among his field companions the repute of being an unusually good shot, and one who is particularly successful in that most difficult branch of upland shooting, the pursuit of the ruffed grouse, or partridge. This prompted the suggestion that he should write down for others an exposition of the methods by which his skill was acquired. The result is this original manual of "Hitting vs. Missing." We term it original, because, as the chapters will show, the author was self-taught; the expedients and devices adopted and the forms of practice followed were his own. This then may be termed the Hammond of system of shooting; and as it was successful in his own experience, being here set forth simply and intelligently, it will prove not less effective with others.

FOREST AND STREAM PUBLISHING CO.

TRAINING vs. BREAKING.

Practical Dog Training; or, Training vs. Breaking. By S. T. Hammond. To which is added a chapter on training pet dogs, by an amateur. Cloth, 165 pages. Price, $1.00.

The Angler's Workshop

RODMAKING FOR BEGINNERS

By PERRY D. FRAZER

A unique work, bringing the science of rodmaking up to the very moment and epitomizing the knowledge and the experience of experts for the guidance of the average man. The evolution of bait-casting principles has made Mr. Frazer's book supersede all previous publications on the subject.

Every angler—young or old—who is fond of adapting his rods and tackle to his own ideas of what they should be, will find in this book a large fund of information gathered by the author in years of study, experiment and practical experience in fishing, tournament casting and at the work bench. He theorizes and speculates not at all. He tells "the how" of everything connected with rodmaking in a way that makes results certain. All explanations are simple and easily followed.

Separate chapters are devoted to each of a half dozen types of bait-casting rods; to tarpon, surf and light salt water rods; bass and trout, salmon and tournament fly-rods. Complete specifications of well known types are given, and the chapter on split bamboo rodmaking is the most comprehensive treatise on the subject ever published. Indispensable in the angler's library.

Cloth, 180 pages, four full-page illustrations, 60 working drawings, making plain every feature of the text. Postpaid, $1.

FOREST AND STREAM PUBLISHING CO., 127 Franklin Street, NEW YORK CITY

The Game Book

STANDARD BIG GAME MEASUREMENTS

Every man wants to compare his trophy with those of other big-game hunters. But comparisons are useless unless there is a fixed standard.

The game book of the Boone and Crockett Club, the foremost organization of hunters of American big-game supplies this. Compiled by J. H. Kidder, it provides directions for standard measurements of the large game animals of America, with spaces carefully arranged for complete data regarding the kill, locality, time, conditions, etc.

It is handsomely and durably bound pocket size. It is an invaluable record for every man who goes into the wild for sport with the rifle, a handy book, a camp companion, and a library reminder of days afield. Leather.

Postpaid, $1.50

THE OBJECT OF THIS JOURNAL

will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects.

—FOREST AND STREAM, Aug. 14, 1873.

BIRDS OF PREY IN TOWN.

THAT Manhattan Island attracts large numbers of persons to its shores every day is well known. That it attracts birds of prey is evident to comparatively few of its inhabitants. In the parks strange birds are seen during migrations; wildfowl build their nests along the lake margins, and gulls in great numbers rest in safety on the larger reservoirs of the water system. All these things the public knows, but it sees little or nothing of the eagles and the hawks which, in the winter, put aside their fears and circle closer and closer to the great city in search of food.

The eagles are not so bold as the hawks; still, one or more of these great birds can be seen occasionally, from Riverside Drive, sitting on or hovering over the drifting ice floes, often close to the pier line of the Hudson River. These eagles find shelter and comparative safety in the Palisades Park, where they are frequently seen in autumn if not throughout the year, but their natural food is not abundant, and this, coupled with the fact that they are seldom molested, makes them bold.

The hawks have gone further and actually visit the city in search of food. The cornices of the tall business blocks and apartment buildings furnish nesting sites for stray pigeons. Others are kept in lofts and attics by persons who raise them for pleasure or profit, and carrier pigeons are kept in similar places. Hawks seem to know that pigeons can be picked up with comparative safety, and no doubt a great many are caught and carried to safe retreats far above the busy thoroughfares, there to be eaten at leisure. So many stray pigeons live on the housetops that it is impossible to estimate the extent of the hawks' depredations, but the disappearance of valuable carrier pigeons is not an infrequent occurrence in winter, and now and then someone tries to balance the account with shot or small bullet, generally with indifferent success.

Perhaps the sparrows are, through a similar agency, prevented from increasing in numbers. They have many enemies, but survive them all—even the occasional blizzard. Sparrow hawks are bold and abundant, but as they are hardly powerful enough to cope with pigeons, no doubt the lesser birds fall to their lot.

FOR A BUREAU OF NATIONAL PARKS.

IN his annual message, President Taft recommended the establishment of a bureau for the control and management of the various national parks, national monuments and national reservations, with a view to having the control of all these reservations placed under a single head, instead of, as now, scattered about in different bureaus of various departments. He said: "Our national parks have become so extensive, and involve so much detail of action in their control that it seems to me there ought to be legislation creating a bureau for their care and control."

Following out this recommendation, Mr. Davidson, of Wisconsin, has introduced in the House of Representatives a bill for the establishment for the Bureau of National Parks, and a similar bill has been introduced in the Senate by Senator Smoot, of Utah.

The bill provides for the appointment of a commissioner, with such experts and assistants as Congress may from time to time authorize, and appropriates $75,000 for the maintenance of the bureau.

The introduction of such bills is gratifying as indicating the growing interest in these national pleasure grounds, the importance of which is only now coming to be appreciated by the public.

STRANGE STORIES FROM AFRICA.

ALMOST every one of the many hunters who in recent years have visited Africa has heard and has brought back with him some tale of mystery, for that vast continent unquestionably holds a multitude of unknown animals that are still to be described.

Most returning hunters are willing to repeat stories, told them by other white hunters or by natives, of mysterious beasts not like anything known to naturalists. On the Elgayo Plateau for example the natives tell of an enormous snake so great that elephants are its common prey. Writers tell of a mysterious monster—apparently a reptile—which inhabits a river or rivers, and which has never been attacked by the natives, though they often see it.

It was by such reports from the natives that some African animals, now well enough known, first came to the notice of the white men.

Natives tell also of animals resembling small elephants which live for the most part under water, and not very long ago an explorer named Prof. Le Petit reported that on the north banks of Lake Leopold II. he saw a group of five animals not unlike small elephants, but with short trunks, small ears, necks longer than an elephant and apparently no tusks, which answered the native descriptions of these elephant-like creatures. The animals were seen at a distance of 500 or 600 yards, but as soon as they discovered the human beings, they rushed into the water and swam away, showing only the tops of their heads. When the trail was found, the natives identified the tracks as those of what they called the water elephant.

Wonderful stories have been coming out of Africa ever since the time of Herodotus, and of these stories very many have proved true. There are a multitude of interesting zoological discoveries still to be made in Africa.

THE motor car is being used in Florida this winter as it has been employed in California, in quail shooting. Pushed as it may be in regions favorable to its use, the motor car can be made a very destructive agent in the scattering and harassing of game birds, and very effective in the bagging of quail that flush ahead of the machine as it traverses country roads. The California Legislature is considering measures intended to restrict the use of motor cars in hunting, but just what form the final measure will take remains to be seen. If motor car owners abuse the privilege they enjoy, they alone will be to blame, for in many places these cars are regarded as a great convenience to the hunter. In Maine, Wisconsin, Michigan and elsewhere, parties have motored to and from the deer forests, and they have only the highest praise for their cars. Many old sportsmen have expressed surprise and satisfaction as well at the obstacles overcome in the woods by motor shooting parties that obey the laws.

THE measure enacted last year by the Legislature of the State of New York, known as the Shea law, prohibits the sale or possession of the feathers of birds of the same family as those found in the State. This law becomes operative July 1, 1911. The feather dealing interests of New York, in view of this event, recently submitted to the Forest, Fish and Game Commission one hundred specimens of feathers used in millinery, requesting to be informed which of them may legally be sold. These specimens, which represented seventy-nine species of birds, were studied by W. De Witt Miller, of the American Museum of Natural History, who reports that forty-three of the species are forbidden under the law. Among these forbidden species are three kinds of herons, two terns, a pelican, a scarlet ibis, the screech owl, the condor, the magpie, Bohemian waxwing and jay.

OLDER readers of FOREST AND STREAM will be saddened to learn of the passing away of another of the old guard. "Tarpon," Samuel D. Kendall, was a contemporary of Nessmuk, of Rowland E. Robinson, and of Fred Mather. He was an especial friend of Nessmuk, who spent two or three of the last winters of his life camping with Tarpon in Florida. Tarpon's life was one of adventure by sea and land, and many of his experiences were printed long ago in FOREST AND STREAM. Of late years, owing to illness, he has not been able to write.

THE SPORTSMAN TOURIST

Winter Camp-Fires

III.—Flooded Out of One Camp and Burned Out of Another—Conclusion

By W. J. BIGNELL

THE winter after Pascal and I had made our unfortunate trip to the barrens we decided on a second expedition to the same region. This time we left toward the end of December and altered our plan of campaign. Instead of going to the Indian hut, we portaged our tent and the necessary provisions right up to the little lake mentioned as being near the summit of the mountain, taking the route where night had caught us on the way down the year before.

Pascal decided to tent directly on the tiny rivulet which was the outlet of the lake. In this way we had a tent site already cleared and perfectly level, and as Pascal remarked, the water hole was right at the door, regulation Indian fashion. This rivulet had only about two inches of water in it, and we had to shovel away four feet of snow with our snowshoes before we got down to the water. One would say that under ordinary circumstances this was a safe place to tent.

Christmas eve found us comfortably installed and we spent the time telling stories or speculating as to our chances of seeing as many caribou as the year before. Pascal was a great believer in dreams, and the previous night in his sleep he had seen many strange beasts. This he announced was an excellent omen.

I will not give a detailed account of our hunting. During three days on the barrens we saw only eleven caribou and secured two. Both heads were very small, but remarkably symmetrical.

A spectacle witnessed during one night of our stay was worth all the fatigues and discomforts of the trip. There was a wonderful and rare display of Northern lights and I routed out Pascal and made him climb with me up above the scrub timber to the rocky treeless part of the mountain where a perfect view was obtained. I cannot attempt to describe what we saw. The outlook everywhere was thrilling and awe-inspiring. We seemed under a celestial dome of exquisite and infinitely varied light, movement and color. Never have I seen either such a display or the dome-like effect. The lights were brightest in the north and east, but the radiance extended on all sides as well as overhead. I reluctantly tore myself away, but the spectacle had so impressed me that I was unable to sleep, and as long as the display lasted I kept going to the tent door to catch other glimpses.

We had packed our outfit up on our backs, but with the two caribou had now far more than we could handle in this manner on the return. It was, therefore, decided that Pascal should

A LYNX THAT WE TRAPPED.

make a trip to the river with a load of meat and return with our sleigh. A good road having been broken, we could take everything that remained in one sleigh load.

Pascal returned late, having taken a lot of trouble to prepare an easy passage for our descent with the loaded sleigh. Happy and unsuspicious as we were, our second series of misfortunes was now close upon us.

Some time during the night a warm wind came up from the Bay des Chaleurs, the temperature rose and it began to rain, and rained torrents all next day. We began to sink visibly, especially in the middle of the tent, but did not attach much importance to this fact.

About nine that evening, Pascal woke me out of a doze by shouting that the brook was starting to run through the tent. Sure enough, our innocent little brook had risen, soaked and packed the snow, and had finally started to run over it in a considerable stream, which augmented even while I watched in my first astonished moment of comprehension. Our inaction, however, did not last long. Our first care was to get the stove outside without disturbing the fire, for otherwise we would have had a serious time of it getting a fire going again that night.

Next I stood inside the tent and threw out the baggage to Pascal. I was stationed on a caribou skin, which rose on all sides of me as the water swirled under it and lifted it up, but I kept dry in my vantage point on the center of the skin until I had to step off so as to throw out the hide itself.

When I stepped off the hide I sank up to the waist in slush and water, and while getting the tent down, we both had to wade about in this manner with the brook rising all the time.

Then after getting our snowshoes on, we had to tent again out of the way of the brook. We were in pitch darkness and the rain was falling heavily. First we groped around for birch trees, from which we gathered the bark to make torches, and here came in the benefit of the fire which was still burning in the pipeless stove, for with wet hands and wet bark it would have been a difficult thing to get the torches in action with the aid of matches alone.

Pascal did most of the making of camp, and I continued to supply torches which were hard to keep lighted, and which had to be twisted and turned constantly.

When we were about half through pitching camp, and after we had been thoroughly soaked, the rain turned to hail and snow, and the temperature began to fall, and before we had finished and were ready to crawl into the shelter of the tent, our clothes were frozen and crackled with every movement.

It was past eleven when, thoroughly disgusted, shivering and chilled to the bone, we were able to close the tent door, and to try to get a little warmth into our bodies. Everything in the tent was wet or frozen and we spent the rest of a miserable night drying ourselves and our belongings.

We boiled some water and dosed ourselves with cups of hot painkiller, to which we added whole spoonfuls of black pepper. The mixture nearly strangled us, but we did not even catch cold.

Our sleigh road, which was mostly on the brook, was now useless. Although it had turned cold again, the brook had become a torrent, and on the way down we had to take to the woods

altogether. We put in a day of scrambling through and over all sorts of obstructions, Pascal in the shafts, and I pushing, holding back, liberating or righting the constantly caught or overturned sleigh.

When we reached the main river, more trouble awaited us. The ice had completely disappeared and the open water of the river had risen as high as during the spring freshets. We tented for the night at this point, for our highway was destroyed, and the character of the country forbade our attempting to get out with the loaded sleigh. On the following morning we made a cache of all our meat and most of our goods; these I sent for later in the winter. Next we made packs, Pascal taking the tent, the stove and a few cooking utensils, and I some provisions and the two green caribou hides, which last we were anxious to get out to the village to use in making new snowshoes.

Late in the afternoon after another day of scrambling through the woods along the river, we struck an old portage cut some twenty years before, but still fairly clear of underbrush in many places. Here an incident occurred which enlivened us greatly and made us forget annoyance and fatigue. In a very straight place in the portage, where we could see a long distance ahead, a lynx suddenly trotted into view, his nose to the ground. I hastily got my rifle ready and waited, for he had not seen us. In a moment back he came into the portage with his nose still to the ground, and as I saw he was about to leave the road, I fired. He stopped, facing away from us, then sat down on his haunches with his back to us and appeared to be watching something in front of him. He was a good distance away, and when I fired again I missed, but he did not move or look around. The next shot crumpled him up like a wet rag. On arriving to pick him up we were utterly confounded to see another lynx in the underbrush some ten feet away, going through his convulsive death struggles. I had inadvertently hit this unseen lynx with the first ball, and his consequent contortions were what had attracted the attention of his fellow at which I had fired and which I had missed. It was evident that he had sat down with his back to us in order to watch the unaccustomed and to him incomprehensible antics of his mate. While we were picking up the two dead, a third lynx appeared from under a fallen tree some thirty feet away and made off at a tremendously fast trot. I had no time to fire at him. Trotting was the only gait I saw these animals employ. This remarkable experience with the three lynx represents the only time in a period covering years, during which I have ever seen any of the species except in a trap. In order to appreciate the significance of this statement, it must be borne in mind that the territory in question abounds with lynx.

That night we used a tenting place which we had made on the up trip. The poles and pickets were already placed and the balsam only needed a shaking, so we were ready for the night in an unusually short time. On getting settled in the tent we found that we were full of fleas from the lynx, which we had hung around our necks to carry, but these fleas evidently did not find us sufficiently nutritious, for they left us the next day.

And now came the crown to our misfortunes, the culminating insult of fate. We were very tired and sleepy that night, and Pascal stuffed the stove full of hardwood chunks and closed the draft just before we turned in. A fire of this kind usually takes a long time to burn, but occasionally if it really gets started, it takes a notion to do things in the way of heating, and then someone has to get up and open the tent door to avoid suffocation.

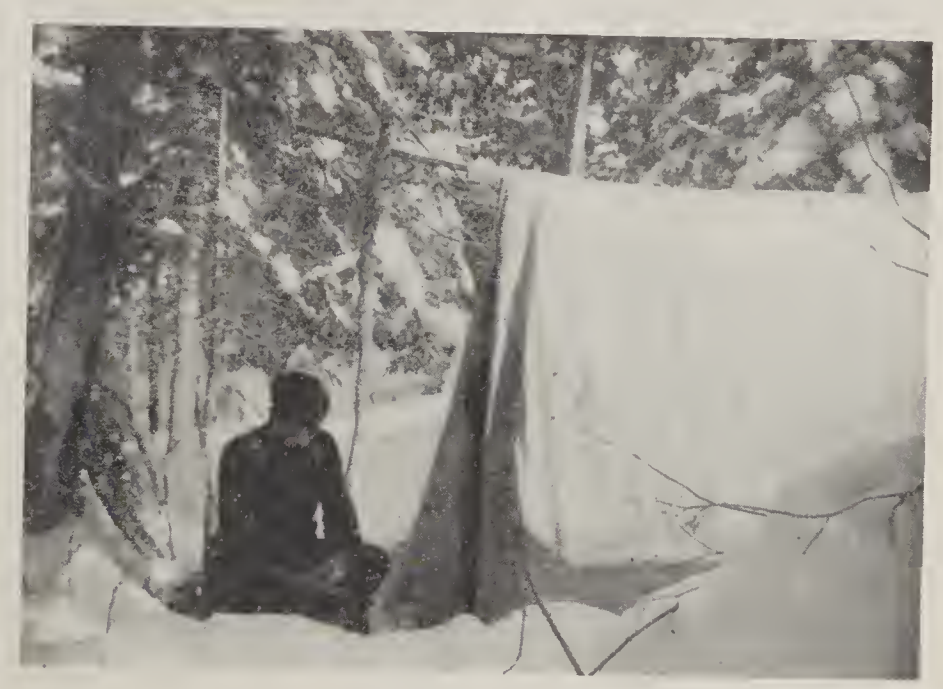
We had been asleep two hours, as I afterward found from the watch, when I began to be disturbed by bad dreams concerning the French revolution. These were attributable to a little pocket copy of Dickens' "Tale of Two Cities" which I had with me, and which I had been reading in odd moments through the trip and during much of the day we were held up by rain. After numerous guillotinings, and amid general bloodshed, ending with a tremendous conflagration of all Paris, I awoke to find crackling balsam under me, sparks falling around me, a burning tent overhead and smoke in clouds. It was a weird sensation, and while I woke Pascal at once, it took me some time to get from sleep to a full realization of what had happened. We put the fire out at the expense of scorched hands, then built a bonfire and sat down to contemplate the wreckage. Only a miserable fragment of the tent remained, consisting of the back and a strip of the sides about three feet in width, but nothing else appeared to have been materially damaged. We figured out that the canvas, which was already scorched around the stove pipe hole, had caught either from a spark or from Pascal's terrific fire and had smouldered till the pipe had fallen against the tent. Falling bits of blazing cotton must have set the fairly dry balsam going as well, and owing to the fact that we were so fatigued from all our adventures, it had taken a lot to wake us up.

Whatever the cause, the damage was done, and with sad hearts and weary muscles we started out into the night for more birch bark and more torches, to enable us to find and chop sufficient dry wood for an all night bonfire to replace the now useless stove. For the rest of the night we scorched on one side and froze on the other under the ragged remnant of the tent, catching snatches of uncomfortable sleep from time to time when not replenishing or poking the fire. But with it all the humor of the situation was uppermost, and we had a hearty laugh over all our troubles.

I was anxious to find out what effect the soft weather had had on the lumbering operations, so instead of continuing down the river on which we were at daybreak, we struck off at a tangent to visit some of the lumber camps which we could reach before night. One of these camps I had not yet seen. It was that of a jobber, who had his wife along with him, and as the understanding with him was for logs at a price per thousand feet delivered, we had taken no interest in what sort of a shack he put up or how he lived so long as he filled his contract for logs.

Pascal had been along with this jobber early in the winter to show him where to build his camp and allot him a piece of territory, and as a visit to the place would not take us much out of our way, I told Pascal to head for the shack

TRAVELING ON THE EDGE OF A RAPID.



TENTING IN THE SNOW.

and we would see what progress the jobber was making.

On the way home I told Pascal that some day I was going to write up our adventures, but he said that if I did no one would believe them. He asserted that if getting flooded out and then burned out in a tent in winter had not actually happened to him, and if someone else had told him of such happenings, he would have known right away in what category to place the narrator.

He finally concluded, however, that if these adventures had not really happened, no one could have thought long enough or hard enough to get up such a combination of fire and flood, and I dare say that he has since regaled many a camp-fire with the story of our experiences.

I have heard from him during the last year, and he tells me that the caribou have never come back to the barrens in numbers as we saw them on the first trip, but he offers no explanation for this.

Ski Jumping

By E. A. DIME

HOW would you like to shoot down a narrow, slippery slide from a steel scaffold eighty feet high, and then leap out into the air over an incline 150 feet high and almost perpendicular?

Just imagine yourself performing this feat with a pair of long flat boards fastened to your feet, traveling at the rate of forty miles an hour, and you may get some idea of the sport of ski jumping—a pastime in which the Scandinavian people of the Northwest find a great deal of sport.

Truly this is a dangerous sport, because every time the skier jumps he takes his life in his hands, for if he should fail to keep his balance while leaping through space, it is possible he may wind up with a broken neck. Yet the Scandinavians see no more danger in their national pastime than we do in baseball, which is a very tame affair when compared to the excitement and thrills of ski jumping.

In many parts of the Scandinavian peninsula skis are used as a means of travel, especially among the people living in the mountains. The heavy snowfalls for which Sweden and Norway are known cover the earth to a depth of several feet, and it would be practically impossible for the traveler to get anywhere without skis. Gradually skiing came to be a national winter sport in the Scandinavian countries, and interest in it has been steadily increasing. Especially has the broad jump been developed to a very high degree, and in the opinion of the most famous ski jumpers the length of the broad jump cannot be increased to any considerable extent. The laws and forces of nature will not permit it. But that there will appear phenomenal skiers, both in the jump and long distance skiing, is natural and self-evident.

The long and steep mountain sides in these Northern countries offer conditions which have made skiing a decidedly thrilling pastime. The skier will choose a suitable point on some hill or mountain side, and from there make his descent. Down he goes, gaining speed with every foot. Sometimes the glide goes over comparatively level stretches, then again there is a very steep decline and it looks as if the ski runner was shooting down the side of a precipice. Down he slides, the wind whistling in his ears as he cuts the crisp mountain air at express train speed, until the "take-off" or start for the broad jump begins. In jumping, the skier shoots right out into the air and may sail on through space for a distance of about 150 feet before he again strikes snow. When he does land, it is upon a very steep incline, and if he is able to stand on his legs at this crucial moment, he has performed a marvelous feat.

Skiing with its joys and thrills, has been transplanted on American soil by the sturdy Norsemen. For a number of years the Scandinavians of Michigan, Wisconsin and Minnesota have held skiing tournaments, which are replete with excitement and interest. The nerve and daring displayed at these tournaments seem to go almost beyond human reckoning, and no circus act has ever held spectators more spellbound than has the slides made by the ski jumpers. Enthusiasts by the thousand come from far and near to witness these events.

To get an idea of the fascination for which this class of sport is known, I visited one of the tournaments held by the Twin City Ski Club in Minneapolis. This club has erected the Glenwood Hill steel scaffold and cable slide, near Keegan's Lake, in the outskirts of the city. In a country where there are no suitable hills for the slide and jumps to be made, it becomes necessary to erect a scaffold from which the skiers slide preparatory to the broad jump. The Glenwood Hill scaffold and slide is the highest in the world, and to behold a skier slide down the narrow slippery trail, make the famous jump and then land on the steep incline, make a spectacle worth going miles to see. The scaffold consists of a steel tower eighty feet high. From the top leads the slide 130 feet long and pitched at an angle of sixty-five degrees. On top of the scaffold is a platform where the men adjust their skis. The slide and tower are supported by four steel cables and several guy ropes which make the entire structure rigid and free from a swaying motion, while the skier makes his descent. The slide is seven feet four inches wide. The cross sections on which snow is placed are composed of hardwood and pine planks six and eight inches wide and of two thicknesses to prevent the snow from sliding off the structure. The lower end of the slide with a slightly upward turn rests about four feet above the apex of a steep hill, down which the jump is to be made. The incline of the hill is about 150 feet with a pitch equal to that of the steel slide. At the foot of the hill is the "dead man's curve," the lowest point in the valley, and from which the ground takes an upward turn, forming the side of another hill.

In order to make a successful jump, the skier starts from the scaffold platform, glides down the slide, shoots out over the apex of the hill (the distance from where he leaves the scaffold until he lands on the snow may vary anywhere from seventy-five to 150 feet), strikes the incline and remains on his feet, then continues the slide until he has passed the curve. To do this requires both nerve and long experience. For an amateur to attempt the feat would be foolish. The most difficult part that the broad jumper has to perform is to maintain his footing after he has alighted on the snow-covered incline of the hill. Coolness in the air and the poise of his body determine the success of this feat. The best professional ski jumpers in America say that it is very difficult to keep cool in the air, and when one fails to estimate correctly the descent a fall is unavoidable.

In order to obtain a good score, a skier has to remain on his feet throughout the entire flight and he has to display a graceful carriage. In a skiing tournament each contestant makes three jumps. The first is a trial jump and no score is taken; the other two count. To the number of feet which the jumper makes are added so many points of character, which means the gracefulness the jumper displays in the air. As a matter of illustration, let us say that the skier makes a distance of 100 feet in one jump and is given by the judges eighteen points for character; this makes 118. In the other jump he covers a distance of 110 feet and is given nineteen points for character, making for this jump 129. His score in the contest would be the sum of the two totals or 247 points. Should a skier make a wonderfully broad jump and be so unfortunate as to fall, he would be entirely out of the running, since he would lose 33 1/3 per cent. of the feet made, and would be given no points on character. The distance reckoned in the broad jump is from the lower end of the slide or "take-off" to a point near the center of the skis on which the jumper alights.

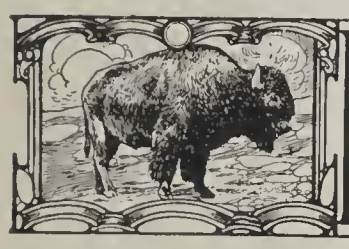
The best skis are made of hickory, birch or oak. They should be so long that the skier can barely reach the end of them with his fingers when the skis stand upright. They should also be very flexible at the center, as these two conditions prevent the skier from getting stuck when he lands in deep and loose snow. Many of our most daring skiers, who have not given any attention to this, have had bad falls, especially so since they are the most eager to bend forward in the downward leap which is necessary to do.

Heavy skis, which are more steady in the air, are preferable for broad jumps, and neither the pressure of the air nor the wind will exert any disturbing influence on the handling of heavy skis. The length of the jump depends upon the weight of the skier, the speed with which he comes down the slide and the position he holds as he bounds forth into the air. He generally comes down the slide in a crouching position, going at the rate of from forty to forty-five miles per hour, and as he leaves the slide he gives himself an extra bounce, which shoots him into space as far as possible.

Wishing to ascertain the sensations felt by those who participate in this thrilling sport, I asked O. O. Jonnum, president of hte Twin City Ski Club, for his impressions. Mr. Jonnum, who is a former national champion jumper, having made a record jump of 130 feet in 1907, said:

"I am now twenty-four and have been practicing skiing ever since I was six years old. I enjoy the game very much, and I am convinced that there is no other sport that equals it for excitement, fascination and thrills. Of course ski jumping is a very dangerous pastime, so perilous in fact that a football game is considered as child's play beside it. In the first place a successful skier should have a clear mind and cool head. He must have perfect control of his muscles, especially those of the legs and feet. He must possess an abundance of resourcefulness and have the agility of a cat. Every time he goes down the slide he practically takes his life in his hands, and to make a blunder under such conditions would be more than a pardonable neglect.

"A thrill shoots through the marrow as one dives down the narrow slippery slide, and the bottom of the hill with the dead man's curve appears as a yawning chasm far below. As I start on the perilous journey I gain momentum with every foot, and as I dash into the air for the jump, the feeling is indescribable. Although one is in the air but a few seconds, it appears a wonderfully long time, and the only desire one has is to hit the snowy surface as soon as possible. While in the air a perfect equilibrium has to be maintained, and the slightest variation then on the part of the jumper might turn out to be fatal. The supreme test comes in the landing. Most skiers have the feeling just then that it is better to fall than to run the chances of taking the great impact which follows when striking the snow. If the alighting could be done on a level surface, it would not be difficult, but it is done on a slippery incline. To stand on the skis and retain balance under such conditions, cover the remaining distance of the hill in an upright position and pass the curve without a hitch, constitute a task of which the inexperienced can form no idea."



NATURAL HISTORY

Pelican Island.

The migratory habits of birds have long been the subject of speculation on the part of naturalists, but so far no one has been able to state positively whether or not individual birds of each species have a regular locality where they yearly repair at nesting time. Unless especially marked it would be impossible to tell whether the robin that reared its brood in the apple tree in your yard last year was the same one that nested there this season. Also there is no way of finding out if the same pair of robins mate together every season. The same statements hold good with most other species whose range of nesting covers an extended area. With some birds, however, the case is different. The brown pelican for instance has but a few nesting places on the Atlantic coast, two of which are in Florida, one on the Indian River midway between Titusville and Fort Pierce, and the other at Passage Key on the Gulf coast. This latter reservation is also a breeding place for gulls and terns.

The reservation on Indian River is known as Pelican Island and is situated at the northern edge of the chain of mangrove-covered islands which extend from Sebastian to the vicinity of Vero and is almost five miles from my home at Wabasso. It furnishes one of the many objects of interest which we delight in showing to our Northern friends who winter with us. The island covers something more than three acres and is almost entirely a mud flat, covered with clumps of tall, wiry switch grass. When F. M. Chapman was on the island in 1898 he states in his delightful book, "Bird Studies with a Camera," that there were a few live black mangrove trees and cabbage palms, but that fully one-fourth of the island was bare ground. If he were to visit the place now he would find it still more barren. The tall straight trunks of the cabbage trees, entirely devoid of fans, loom up like huge gate posts. The mangroves have died and only a few naked limbs reaching up into the air remain to attest the fact that trees once grew on the island.

Just why the pelicans choose this particular island as their nesting place has ever been a source of wonder to me, for nearby there are a number of others which appear to be just as well or better suited to their needs. The only explanation I can offer is the home attachment which among the human race causes the Arabs to love the cheerless deserts or the Swiss their rugged mountains. It is said that a few pelicans once built nests on another island near Narrows, but since I have been on the river I have learned nothing concerning this, and think the statement must be an error.

When Mr. Chapman visited the island he found 251 occupied nests which contained 158 young birds and 250 unhatched eggs. I visited the island in February, 1910, and at that time the warden in charge estimated the crop of young birds at something over 1,000, a remarkable increase and a splendid argument in favor of the protection of the breeding places of the birds.

Prior to 1901 the poor birds were harassed throughout the entire nesting season by plume hunters, egg collectors and vandal tourists who broke up the nests and shot the birds in great numbers. The story of some of these slaughtering matches is disgusting in the extreme. An old man who wintered for a number of years in this region told me that he landed on the island after one of these raids and found the entire place littered with the dead bodies of the birds, and once the heads had been cut off and left in piles. No doubt there had been a contest among the tourists as to who could kill the most in a given length of time, and the heads were collected to keep tally much in the same manner as buffalo tongues were used years ago

COMING DOWN THE SLIDE.

THE JUMP.

in the great slaughtering matches on the plains of the West.

In 1894 one egg collector alone carried off 125 sets of pelican eggs. With such persecution it is a wonder that the birds did not abandon the island altogether.

In 1901 the State passed a law protecting non-game birds, their nests and eggs, and the Audubon Societies placed a resident warden in charge. In 1903 the United States Government made the island a Federal reservation and placed it under the jurisdiction of the Department of Agriculture, since which time the birds have not been molested.

The warden in charge is Paul Kroegal, of Sebastian, whose work as protector of these interesting birds cannot be too highly commended.

Much harm was formerly done unintentionally by well meaning tourists who only came to see, but who chased the birds from their nests and exposed the fledglings to the hot rays of the sun. In this way many young birds were killed by the heat, and many unhatched eggs were spoiled. It is said that at a certain period of incubation, ten minutes' absence from the nest on the part of the old bird will ruin the eggs.

On approaching the island, the first intimation one has of its presence is the smell, which is very decided and not exceptionally pleasant. The next intimation is the shrill cry of the young which is kept up intermittently day and night. Their cry is a shrill sort of scream, and at a distance reminds one of a number of school children at play. The adult bird, unlike the young, is neither noisy or pugnacious.

In the morning it is a pleasant sight to watch the pelicans depart for their fishing grounds at the ocean beach or along the big shallow river. They travel in groups of from two to fifteen, flying in a slanting line, flapping their wings in perfect unison for a while, and then spreading their wings sail along majestically for a few seconds, when the operation is repeated. Their mode of fishing is to fly slowly about until a fish is spied, when they dart down, hitting the water with a terrific splash, seize their prey, and righting themselves float lightly on the water for a few seconds before swallowing the meal, which is accomplished by throwing back the head, expanding the neck and giving the head a shake or two.

The young pelican must learn to fly and his efforts to do so are often ludicrous. The young bird appears to be very proud of his wings and when the plumes are growing will often sit for hours waving his wings in the air. When hundreds of them are thus engaged and the air overhead is full of circling adults, the island and everything about it appears to be a mass of wings and forms a picture long to be remembered.

On one occasion while a crowd of us in a motor boat on the river passed near the island, a young bird that had just mastered the art of flying came out to us and tried to alight on the bow. It happened that a young lady was seated there who did not relish this friendliness, and who, at the pelican's near approach, screamed strenuously, whereupon the pelican shied away, but continued circling about over her head for some time, wondering no doubt what sort of creature this was that could make noises so wonderfully like himself. C. A. V.

Flamingo on Long Island.

On the 21st of last November, C. W. Ogden, of New York City, and three other men, who were gunning on the bay side of the outer beach, opposite Center Moriches, Long Island, N. Y., saw flying toward them, two or three gun shots from the shore, an extraordinary bird. It was very large, with a long neck stretched out in front, and long legs behind, and when it came opposite them, they could see the thick crooked bill, the pinkish-white color and the dark wing tips which told them that it was a flamingo.

It was quite clear that, seen in that place and at that time, a flamingo must certainly be an escaped bird. The only person known to have flamingoes in confinement anywhere in this neighborhood is G. D. Tilley, of Darien, Conn., whose collection of captive birds is well known. Inquiry of Mr. Tilley reveals the fact that last autumn while receiving a number of flamingoes, one of them escaped and when last seen was flying south toward Long Island Sound from Darien. Later, Mr. Tilley received a newspaper clipping saying that someone had captured the bird, but nothing further was ever heard of it.

Have any of our readers any information as to the ultimate fate of this bird?

Crows and Robins Lost in Fog.

Waterlily, N. C., Jan. 28.—*Editor Forest and Stream:* About a month since we had a very heavy fog, so thick that several hunters had to stay out all night as they could not find their homes. The fog lasted twenty-four hours, and when it cleared there were hundreds of crows floating on the water. There were nearly one hundred in front of my house, and I saw them floating for several miles down the sound. They roost on the beach near old Currituck Inlet, but feed back on the farmlands. I suppose they got lost in trying to find their roost, and flew round and round, until, becoming exhausted, they dropped in the water and drowned.

On the 19th and 20th it was very foggy again and on the 20th I saw the largest flight of robins I have ever seen at Currituck, coming apparently straight out of the ocean. It lasted for three hours and they came in countless thousands. I suppose they were migrating and wandered out to sea. I have no doubt many of them were drowned. More Anon.

Dwarf Deer of Mexico.

While hunting in Durango, Mexico, last spring I learned some facts as to the natural history of the whitetail deer of that region, which were so surprising to me that they appear to be worth noting in print.

These deer are dwarfs, a full grown male weighing probably less than 100 pounds. In fact, when running at full tilt through the chaparral they very much resemble jack rabbits. They subsist entirely upon the leaves of the manzanita and the acorns of the live oak. The latter are swallowed whole, but my surmise is that they are thoroughly masticated upon regurgitation.

What most surprised me was that their rutting season occurs in April, and at its close they shed their horns. There was no mistaking the fact of the rut. Autopsies performed on several females established it beyond peradventure, and there was other evidence in plenty.

Why these animals should be so diminutive in a land abounding in food and water, and why their habits should be so different from those of their Northern congeners, is surely a puzzle.

W. B. S.

[The deer of Southern Arizona and of Mexico are very small—fairly to be called dwarfs. Perhaps the species referred to is Coues' deer, but that species is said to drop its young in July. It is thought to be the fact that the more southern the deer, the later the breeding season.—Editor.]

Silver Gray Fox.

Despite the fact that fox hunters in this section of the country repeatedly assert that their dogs have started and run a silver gray fox, many of the old citizens are in doubt regarding the truth of the statement. The only genuine silver gray fox that has been shot in or about Monticello, N. Y., was killed by Dr. J. F. Curlette, of this village in 1892. The animal was killed near Mountaindale, New York, a station on the O. & W. R. R., and was inspected by a great number of people interested in these animals. Dr. Curlette presented the trophy to the Museum of Natural History, New York city, where it can be seen. Its appreciation was freely expressed by the New York press of that date. M. T. D.

[Just what is meant by silver gray fox we do not know. The term is often used of the common southern gray fox (*Urocyon*), but sometimes is used for the silver fox, which is believed to be a color phase of the red fox.— Editor.]

Desert Plants about to Flower.

At the New York Botanical Garden is part of the collection of desert plants in Conservatory Range No. 1, House No. 5. Among these are the aloes and related plants, mainly from southern Africa. Many of these are now coming into bloom, for it is summer in that land and they are following their native habit. Forms of aloes are represented by plants ranging from a few inches to several feet in height. The flowers are showy and are usually borne on long stalks in racemes or panicles. One of the most interesting is *Aloe succotrina*, from the island of Socotra. From the leaves of this and other species, the drug "bitter aloes" is derived.

Florida Martins.

Tarpon Springs, Fla., Jan. 26.—*Editor Forest and Stream:* The martins came last year on the 25th of January, but I have not seen them yet this season. They left their house on June 14, although they stayed around town and made an occasional visit to their old home until near the end of June, when they disappeared.

The English sparrows made a very determined effort to occupy our martin box not long ago but I got out the hose and sprinkled them thoroughly, so that they left in disgust.

I did the same thing last year, with the same result. Kelpie.

GAME BAG AND GUN

Colonel Roosevelt in Africa.

THE annual meeting of the Boone and Crockett Club was held on the evening of Tuesday, Jan. 24, in the Council Chamber of the University Club, in New York. President Wadsworth presided. After the reading of various reports came the election of officers, which resulted in a choice of the officers of the preceding year, except that Winthrop Chanler resigned as Vice-President for New York, his place being taken by Theodore Roosevelt. New members of the Executive Committee elected were E. Hubert Litchfield and Dr. Lewis Rutherford Morris. The report of the Game Preservation Committee was read by J. Walter Wood, who, as a supplementary report, read the announcement about the new antelope herds, printed last week in FOREST AND STREAM.

At the close of the meeting, members and guests to the number of about fifty-five sat down to dinner. Mr. Wood offered a resolution expressing the thanks of the club to Major L. M. Brett, First Cavalry, Acting Superintendent of the Yellowstone Park, for the care and interest that he had devoted to the work of capturing the antelope for the new herds. The resolution was unanimously adopted.

At the end of the dinner, the president having rapped for order, said, "It is hardly necessary for me to introduce to you the founder of the club." When the applause had died down, Col. Roosevelt began a long and interesting account of his African trip. The latter part of the address was illustrated by lantern slides of some remarkable pictures taken by Kermit Roosevelt.

After a jocular allusion to the fact that many good people supposed that he delighted only in blood and slaughter, the speaker explained that he had gone to Africa not primarily as a big-game hunter, but as the leader of a scientific expedition which, he believed, had resulted in the greatest single contribution to our knowledge of the life of East Africa that had ever been made. There had been brought back from there, largely through the efforts of Dr. Mearns, Mr. Heller and J. Alden Loring, nearly 9,000 specimens of birds and small mammals, 2,000 specimens of reptiles and fishes, and nearly 1,000 large mammals; in other words, between 11,000 and 12,000 specimens, among which there were many new genera and species. Most people who make expeditions to Africa go there to hunt the big game, and it is the trophies of big game which they bring back with them to the world centers. Few expeditions have been sent out with the idea of collecting the small mammalian life of the region, and so that life has remained largely unknown.

A large number of new rodents, insectivores and small carnivores were found, and good series of many forms were secured. A little mouse, similar in appearance to our white-footed mouse, was common, and shrews were found abundant under the equator, not alone high up on the mountains, but also down in the lowlands. A diurnal bat, blue and yellow in color, which has the extraordinary habit of hanging on a twig in an acacia tree, dropping down when it sees an insect—swooping after it, in fact, as one of our small flycatchers would swoop—and then returning to its twig or one nearby and hanging itself up again, until some other prey appears.

There were queer big-eared foxes, once thought to be peculiar to South Africa, whose teeth show affinities with long extinct flesh eaters, that wandered about at night and could be taken only by shining their eyes with a light. A great number of interesting observations on the life histories of many small mammals were made by the naturalists connected with the expedition. Only a beginning has as yet been made toward working up these collections, but there is much material available.

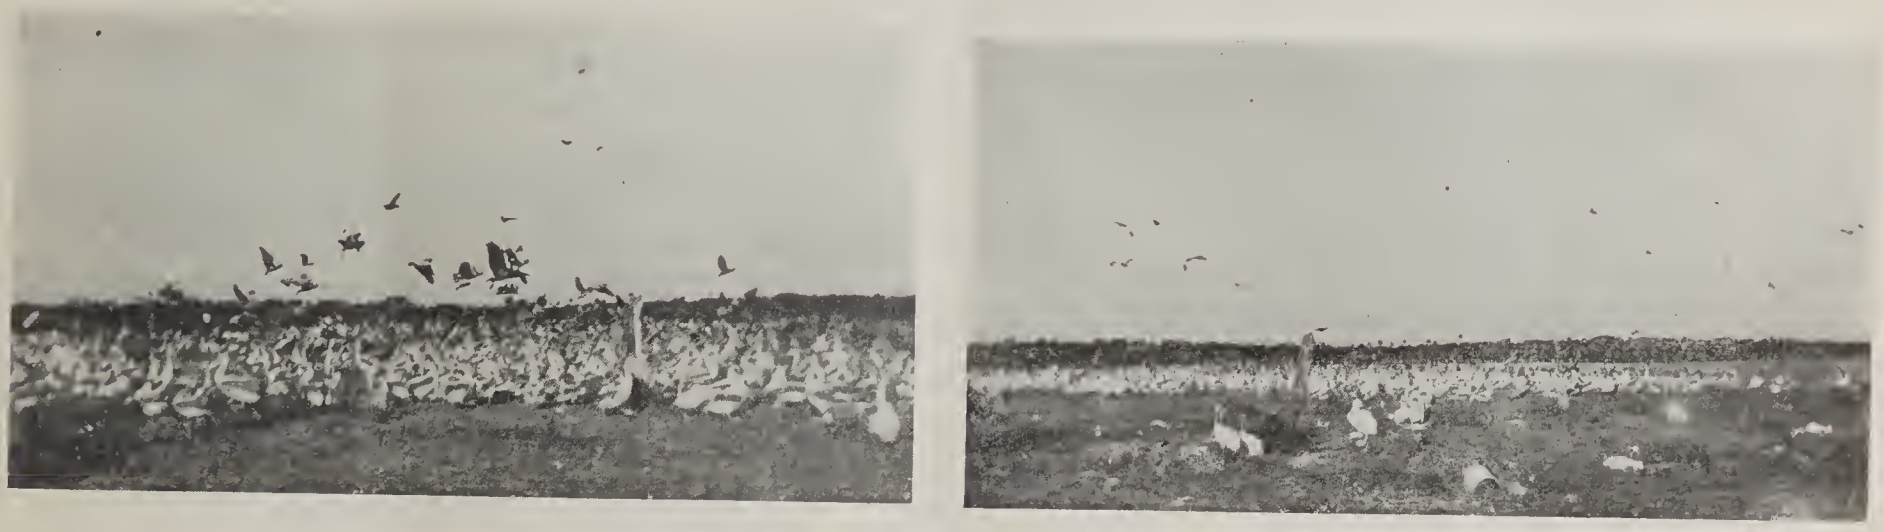
Colonel Roosevelt had much to say about the theory of protective coloration, so fully gone into in a recent volume by Abbott H. Thayer. He disagreed wholly with Mr. Thayer's conclusions so far as many of the African large mammals are concerned. The hartebeeste, wildebeeste, zebra, Thompson's gazelle and other species named, absolutely contradict, according to Colonel Roosevelt's observations, the conclusions drawn by Mr. Thayer. The speaker announced his belief that not a few animals and birds are protectively colored, but declined to accept conclusions offered with regard to many African species, as well as with regard to certain American animals, such as the prong-horned antelope. Some questions asked by members threatened to open a general discussion of this subject, for which, of course, there was no time.

Colonel Roosevelt spoke of the arms used on his trip and said that for most of his hunting he used American rifles, taken with him from this side, although friends in England had presented him with a double-barrel rifle of English make. With the army Springfield gun of small caliber, using full-jacketed, sharp-pointed bullets, he had killed much big game up to the size of the rhino.

The question as to which species of large game is the most dangerous—one over which there has been much discussion and which will probably never be settled—was referred to. From his own limited experience, Colonel Roosevelt is disposed to regard the lion as the most dangerous animal, the buffalo next, the elephant third, and the rhino fourth. He recognized, however, that many men of great experience placed the animals in a different order and spoke a word of warning against the common tendency to generalize from limited experience.

It is always difficult to infer the motive which influences an animal when it runs in a given direction. A beast may often run directly toward the hunter, who imagines it to be charging him, yet it may be unconscious of his presence. He told of being charged by a wounded hippo, but this took place in a narrow bay, the hippo being on the landward side, while the boat was toward the open and deep water, and the speaker could not make up his mind whether the animal was charging the boat, or only trying to escape to the lake.

A recently returned African traveler told of



BIRDS ON PELICAN ISLAND, INDIAN RIVER, FLORIDA.

shooting at a lion which started off immediately across him, apparently not knowing the direction from which the wound was received. The hunter ran forward to intercept the lion, and when he came within plain view of it, the animal turned and rushed toward him and was killed only thirty or forty steps away.

Before turning to his pictures, Colonel Roosevelt paid a warm tribute to Buffalo Jones—who was present—and to the cowboys who had been with him, for their feat of roping and tying an eland, a rhino, a lioness and some other African wild beasts.

The pictures taken by Kermit Roosevelt could only have been made by a young and very daring man; many of them were taken at such close range as to argue great enthusiasm on the part of the photographer and great activity in getting away from the close neighborhood of dangerous animals. The pictures of elephants and rhinos, both black and white, were taken at ranges of twenty-five yards and twenty feet, respectively. No such pictures of elephants, and of course, no such pictures of white rhinos have ever been made. The Dugmore photograph of the charging rhino is, it was said, the only one of a black rhino taken at a shorter range than those made by Kermit Roosevelt of the same species.

The greater number of the pictures had to do with wild animals in their natural surroundings. An exceedingly interesting picture is that of the iguana robbing the nest of a crocodile. The crocodile was on the bank twelve feet below the nest, while the iguana—about four feet long—was visiting the nest, taking out an egg which it carried into the bushes and ate, and then returning for another egg.

Perhaps the most interesting thing told by the speaker was his account of the killing of a lion by a group of Nandi warriors armed with spears. These warriors sent word to the American chieftain that if he would promise not to shoot the lion, they would show him how their people killed it with their spears. Accordingly on a certain day the group of fifty or sixty men armed with spears and ox-hide shields came to the camp, and the white people set out on horseback, to beat up the country and find a lion. They started one, and chasing him on horseback brought him to bay and sat on their horses about him as he lay on the ground under a bush; presently the Nandi warriors appeared trotting along in the distance, their spear heads shining in the sun. The spear has soft metal head four feet long, a hand's breadth in width; this is fastened to a short piece of wood and the butt again is of iron. As they got near to the lion, two men stopped in front of him and the others scattered out, each at a few yards distant from his neighbor, until they had surrounded the beast. Now he began to get angry, rose to his feet, roared furiously and looked from side to side for some way of escape. The men began to close in, making the ring smaller, and the gaps in it less wide. At length, the lion charged fiercely on a man who, holding his shield before him and bracing himself so that all his muscles stood out, held the spear above his shoulder, and as the lion reached it, gave it a slight push forward. The head of the spear entered the animal's chest near its shoulder, flashed through and came out through the flank on the other side. The beast caught the man with his paws by both arms and sunk his teeth into the top of his shoulder. By that time, two or three other spears from the approaching warriors had pierced the animal and in a few seconds it was dead. It had seized one of the spear heads in its mouth and bent it into horseshoe form. The whole attack hardly lasted ten seconds, but they were moving seconds. The Masai warriors, we are told, consider that two of them are good for a lion.

Colonel Roosevelt was followed by Colonel C. J. Jones, commonly known as Buffalo Jones, who talked interestingly about the moving pictures which he showed. He had taken to Africa two or three cowpunchers and ten thoroughly trained cow horses, and there performed the great feat of roping wild animals as already described. The pictures showed what might well enough have been a lot of cowpunchers riding in the high country of Wyoming or Utah—so greatly do the East African plains resemble that country in general character. Horses, saddles, ropes and men, all reminded one of the cattle country, except that the men wore the helmet, so necessary under the equator. The pictures showed the capture of a number of different animals, including eland, giraffe, wart-hog, cheetah, rhino and a lioness. They were of great interest, but the pictures of the wart-hog and of the rhino were much more effective than the others.

At the conclusion of these pictures, a vote of thanks to Colonel Jones was passed by the club.

Book Exchange.

Among the readers of Forest and Stream there are many who are interested in old out-of-print and rare books on sport, travel, exploration and kindred subjects, and frequent letters are received at the office ordering such books.

In the very nature of the case, however, these cannot be supplied on order, and it often takes months of search to secure copies, by which time the person who ordered them may have forgotten all about the matter. Within a few weeks we have received from readers and from dealers a dozen orders for a supposed book called "A Boy in Indian Camps," which orders were called forth by an article printed not long ago in Forest and Stream, describing a book published in 1850 and long out of print. Such books as Dodge's "Plains of the Great West," "Hunting Grounds of the West," Elliott's "Carolina Sports," Palliser's little book on Western hunting and others are often sought for.

These volumes and others like them contain a world of vivid interesting description of life in the open, as it was from forty to sixty years ago, and furnish most delightful reading. On the other hand, because they are scarce, they are costly by comparison with the ordinary outdoor book, which has just been published and stands in numbers on the shelves of the book seller.

No doubt there are many of our readers who possess these old books, and others who would be glad to possess them, and we are, therefore, making a special place in our advertising columns, which may be called a book exchange, where those who wish to purchase, sell or exchange second hand books may ask for what they need, or offer what they have.

'Cross Country in Florida.

On the first day of the open season, Nov. 1, Will and I left the city about sunrise on a few days' cross-country quail hunt. We did not expect to do much hunting the first day, so left with but one dog, old Pete, a brown and white pointer; for that night we were to stop with a friend who lived about twenty miles from town, who had a couple of young dogs belonging to Will, besides several of his own. As Charley was to join us on the trip there was to be no scarcity of dogs after reaching his place.

About eight miles from the city we left the country road and struck out through the woods to the southwest, as we wished to do a little hunting before striking the ford at Thomas' Swamp. It was after leaving the country road that we noticed the effects of the West India hurricane that had swept over the State a few days previously. Down timber gave us more or less trouble, and it was about noon when we reached the ford. This used to be an ugly piece of fording, as I discovered some years ago while crossing during a stage of high water, but of late years the sand has washed over the roadway and filled the holes, so we got across without taking in any water.

Leaving the swamp behind, we drove up onto an oak ridge, on the crest of which, under the overhanging branches of several large oak trees, stood an old log church. Two years before, when Will and I passed over this ridge on our way to the St. Mary's River we found a covey of birds near the old church, so we decided to feed the horses, eat lunch and try to locate a covey.

Old Pete was along on our former trip, and evidently remembered about finding the birds, for while we were busy with the horses he disappeared. The east slope of the ridge was covered with a dense growth of black-jack, and as there had been but little cool weather, they were still in leaf, making it impossible to see further than a short distance in any direction. Taking our guns we separated and beat back and forth across the ridge, and it was not long before Will signalled that he had found the dog. When I reached him Pete was holding his point, but his actions told us as plain as words that the birds were scattering. At a word from Will the old dog crouched with belly to ground and started to circle the birds so they would bunch again, but we had been too long in finding him, and before he had more than half completed his round-up a portion of the covey flushed, followed by the balance. The birds flew in every direction, some coming back over our heads. I made a clean miss with my right, but managed to score with the left. Will got in but one shot, but failed to score. We were unable to mark down a single bird, but by working back and forth across the ridge Pete picked up four singles, Will bringing down two, while I made a kill and a miss.

Going back to the wagon, we ate lunch and enjoyed a smoke while the horses were cleaning up their feed. Figuring that we were within five or six miles of our friend's house, we decided to leave the road and hunt the ridges for a few miles. It was good looking bird country we passed over, but the day had turned off warm, and as Pete is beginning to feel the effects of old age and hard hunting, we took it

easy, finding but two coveys, out of which we took six birds, not following up the second covey after the rise.

We reached our friend's house just at dusk, and after a hearty supper were early to bed.

It was about 8 o'clock before we got started next morning. With our camp outfit, horse feed and two dogs in the rear, and three men on the seat, the wagon was full to overflowing, and we were holding tight as we rattled along at a lively clip over an old hauling road, for it was a brisk morning and the horses wanted to go. The three young dogs ranged the roads ahead, while Pete and Major whined and craned their necks from the wagon. We had not gone far before Belle, a young black and white setter, winded birds. Sport, a fast-going lemon and white pointer, took the trail, and in a few moments was frozen on a point, backed by Belle and Rex, making a picture one does not see on canvas. Will stayed with the horses while Charley and I went after the birds. It was in the flatwoods where we found this covey, and in every direction were ponds or bays so we could not tell which way they would go. It so happened that they had a fancy for a bay back of us, and over our heads they came. I got one with the right and missed with the left barrel. Charley, who is one of the best shots I have been in the woods with, scored two clean kills.

Going back to the wagon, we decided not to follow the birds, for the bay was a thick one, and Charley said we would find all the birds we wanted before the day was over. About a mile further on the road wandered over an oak ridge and dipped down into a shallow looking ford, but on the right side there was a deep washout that we plunged into and came near having an upset. The horses snorted as they pitched into the hole but lunged through, so the only damage done was to take in some water and wet our outfit. At the top of the hill we left the road and drove through the woods expecting to strike a camp site Charley had in view, about noon; but we got into a stretch of country that had been cut over some years ago for crossties, the ground being strewn with tree tops and logs that had never been cut up, and by the time we worked out of this tangle and struck camp it was 2 o'clock. It did not take us long to pitch the tent, feed the horses and gather a supply of wood for the night, then after eating a hasty lunch we tied up the young dogs, and taking Pete and Major, started out hunting. We were in an ideal bird country and enjoyed some good shooting in the short time we had before darkness drove us back to camp, where the young dogs greeted us noisily.

While I was preparing supper Will overhauled the duffle and brought out a couple of blow beds, one of which he handed to Charley with the suggestion that he blow it up while he was doing nothing.

"Good idea," replied Charley. "Where's the pump?"

"Pump! Do you think this is a garage or a bicycle shop?" said Will. "Use your lungs; it will do 'em good."

Then there was some argument, which I helped along as I stirred the hominy. It ended by both lying flat on their backs, mattresses spread out over them, tube in mouth. In about a minute Charley sat up to see what progress he was making, forgetting to put his finger over the tube and shut off the escaping air. I roared at the look on his face as he tried to get hold of the tube in the flickering light of the camp fire; and Will got to laughing so he had to suspend operations for the time being; but the job was finally accomplished, and those mattresses felt mighty comfortable when we turned in.

We were up bright and early the next morning, and during the day hunted the ridges that stretched away for miles west of our camp. The dogs worked well and we had fine sport, getting covey, single and snap-shooting in the branches. Had it not been that the young dogs were good retrievers we would have lost many a bird in the branches, for in places the undergrowth was so thick and interlaced with briar vines that it was impossible for one to force his way through.

When he headed toward camp Charley took the lead and he dropped into a stride that gave Will and I all we wanted to do to hang to, and before camp was sighted it was hard work getting our feet over the logs without having the boot heels scrape.

Reaching camp we had to start in at once and pack, for we had to drive several miles to a railroad crossing, where I was to catch a train back to the city, while Will and Charley were to spend the night with a friend nearby and drive home next day. As we struck into the road leading to the railway Charley said we would probably get a little more shooting before dark, which caused Will to remark that if he left that wagon seat cushion before he reached the railroad it would be because the outfit turned over. And though Charley and I got out a couple of times to go to the dogs, Will held down the cushion.

Night overtook us before we reached Mr. G.'s, but it is never too late for us to re-

HUNTING FOR A WING-TIPPED BIRD.

ceive a welcome there, and after the horses and dogs had been cared for, three tired, hungry hunters sat down to a supper that was thoroughly appreciated. Never did the big fireplace and the rocking chairs look more inviting than when I left to catch the train, which was one hour and thirty minutes late. When I finally stretched out in my own bed at about the midnight hour, I felt as though I had been up forty-nine hours and tramped over a good portion of northeastern Florida. But I would have started out again the next morning on a similar trip, had it been possible.

George A. Irwin.

Crows in Town.

Omaha, Jan. 27.—*Editor Forest and Stream:* While coming down Farnam street early one morning I saw a sight that vividly brought back to me my early days in Omaha. Sitting on one of the lower limbs of the big cottonwood tree that stands a short ways back from the southwest corner of Farnam and Thirty-first street—a fashionable residential district—were two big black and very sedate looking crows, humped up in the frosty air, complacently watching the passing motor cars and pedestrians.

When I came to Omaha a quarter of a century ago, the crows fairly infested the city all through the winter months, perching by ones and twos and scores, on every tree and post and shed top in every door yard, or feeding on the refuse in the middle of the streets with apparently no more fear than is manifested by the tame pigeons of to-day. There was a city law then prohibiting their molestation, but it was this alone which caused these birds to frequent the very heart of the city and in fact all parts of it. I do not know whether that old ordinance was ever repealed or not, but along in the early '90s the crows began to grow shy and finally quit visiting the city almost entirely. This is something with all my familiarity with the habits of birds, I never knew to be the case in any other city in the country, and I do not believe it exists anywhere now. The crow is naturally a wild and wary bird, and the sight of even a stray one in the busy haunts of man is a rare thing indeed.

The hunters are still making life miserable for the rabbits—they are all that is left now, save an isolated bunch or so of lingering mallards. Of course it is capital sport for those who have not been educated up to the higher phases of sportsmanship, but it is getting well along toward the time now when the cottontails should be exempt from molestation. They begin to rut in February and by March 10 are heavy with young. After February 1, I do not think a rabbit should be killed, but there being no legal close time in Nebraska, improvident hunters keep after them till well on to May. They will tell you, too, that nothing can beat it—going out into the woods and fields and silent places with two or three—the more the better—good rabbit dogs. They will relate, with the most voluble gusto, what sport it is to trail bunny to some old brush pile, jump upon the same, drive poor Molly out and sic the curs after her, and as she yew-yaws through the weedy tangle, to blaze away at her with a gun. Fine sport, oh yes, fine sport.

The fate of the wild pigeons, so much talked of in your columns these days, was indeed a melancholy one, and the thought that there is but one solitary living bird left in all this big world, is truly harrowing, especially to one who has seen them as I have, back at my home in Lancaster, Ohio. The one lone bird still existing, as you probably know, is the property of the Cincinnati Zoological Gardens. It is a hen and apparently in thrifty condition. It is thirty-five years old and its mate died but one year ago, at which time there were three other birds known to be alive, the latter owned by some nature society in Milwaukee. But all three of these birds also died during the year just closed. They were all very old and highly prized, and the Cincinnati bird that remains as a sad reminder of those wonderful days in the early '70s, could not be purchased.

I was a visitor at the Cincinnati Zoo in October, 1890, and at that time there must have been a hundred or so of these birds there, but I understood at the time that, while they were apparently as vigorous and free from disease as in their native wilds, they would not breed.

Just after the war of the rebellion, the wild pigeons were most numerous in Ohio, and when I say that I have seen them, in their passage in the late afternoons from their feeding grounds in the Kettle Hills to their roosts in the big oak and hickory woods north of Lancaster, absolutely and wholly obscure the whole firmament, I am only saying what hundreds of the old residents of that section will thoroughly corroborate. On several occasions the public schools, owing to the darkness brought on by the incalculable hordes of pigeons passing over, would be compelled to dismiss an hour or more before the regular time, and we children as we ran gleefully into the open air, would have to whoop and shout to make ourselves understood in the almost deafening roar made by the flapping of billions of wings above us. Before the sun would dip behind the western horizon the birds would have all passed, and it was like the dawning of another day.

It was no trick at all for me, a small lad, to go out on the outskirts of the village, and kill all the pigeons I could tote home, with a little single-barrel toy shot gun, that wouldn't kill even a delicate song bird across the country road. I would get so close onto the birds, perched in the apple trees in an orchard, that when I drew on them the muzzle of my gun would not be more than ten or twelve feet from them. I have even killed them with small flinty pebbles I had recourse to when I had no money to purchase shot, and many a time did I strike at the passing birds with my gun barrel. Scores of times too, I saw a single gun bring down over one hundred of these birds in a single morning's shoot, and once, when I went out on the Flat Rock—a ridge running east and west just north of the town—with Cash Cannon and Amos Flood, the noted hunters of the place, to retrieve the birds, they actually killed as many as they could pile in a little old ramshackle express wagon they had taken for the purpose. I cannot now recall the number, but it must have been in the hundreds. It was a cold March morning, and the two hunters shot from daylight, when the birds always began to leave for the feeding grounds, till about half past eight.

Sandy Griswold.

More About Foxes.

Not far away are some secluded meadows shut in by rugged hills where Reynard often comes for breakfast, and tilted against the hills are acres of wild pasture where he has his home and where Madame Reynard leads forth her young in April days. This is an incentive to many of my across-lots walks, not that I am an orthodox sportsman and keep a hound, but chance meetings offer me an opportunity to balance an old account with Reynard, which I am especially ready to accept. Of late years and especially when fur is prime, I carry a single-barreled 12 gauge gun. The weight of the gun does not much interfere with walking and I like to be provided for every contingency.

One of these chance meetings of a year ago ought to be well remembered by a certain mousing fox. I had risen early, taken my gun and a handful of shells and slipped out for an hour's ramble along the creek before breakfast. A squirrel carrying a butternut tempted me to a long shot and then mysteriously disappeared. I found the butternut with a solitary shot imbedded in its sticky rind, and after reloading I thrust the nut thoughtlessly in my pocket on top of my ammunition. Still keeping to the creek bank and not more than ten or fifteen minutes after the squirrel episode, I saw a fox standing on the fence along the woods a hundred yards to my left. After a careful survey of the premises and not scenting danger, he jumped lightly down into the meadow. In a moment I was down behind a convenient stone wall and so engrossed was the fox in his pursuit of mice that he never lifted his nose from the stubble until the gun cracked at forty or fifty yards. Then he performed a remarkable acrobatic feat, jumping straight up in the air and turning more than half way around before he came down. He had not yet located me when he started to run up the hill parallel with the wall behind which I was partly concealed.

Meanwhile I had ejected the empty shell and was frantically trying to pry open my pocket which was glued tight and fast by the butternut. Before I had completed the operation and dug out a shell the fox saw me, turned sharply off and disappeared in the woods.

At first I was wroth at losing such a prize. There was certainly no excuse for missing him, and I was sure that he was hit. Then I picked up the empty shell and remembered. During the summer months we had kept a quantity of shells on hand loaded especially for English sparrows, and a few of these left over had somehow got mixed with my No. 4s. Fortunately for the fox, I had given him nothing more than a painful surprise with No. 8s.

While busy about the farm work I have had memorable glimpses of the fox. On one occasion two years ago I was plowing in a remote field. It was an Indian summer day, late in November. All that morning I had taken a lively interest in the insistent cawing of a flock of crows just over the ridge. I was on the point of making an investigation when the flock moved eastward, following a fence row and then turned down the hill along the woods to the wild pasture. The cawing continued, and mingled with the raucous cries I heard the barking of a fox. This sound, so associated

with the darkness and cold of autumn and winter nights, seemed strangely out of place. I left the plow and hurried down the hill to witness the performance.

The foxes, for there was a pair of them, were evidently not of one mind, which accounted for the commotion. They were standing two or three rods apart, facing each other. Suddenly one rushed forward, the other meanwhile standing motionless. Then I heard a succession of hoarse yelps and the advancing one wheeled and retreated to his former position. This performance was repeated several times. I could not be sure which fox was doing the barking, but thought it was the motionless one. At a distance of 175 yards they paid no attention to me.

The opportunity was not to be lost. I ran down to the house and ten minutes later when I returned with the gun they were still at their play. Screened by the clumps of witch-hazel and hardhack that dotted the pasture, I approached almost within gun shot unobserved, but the ground, honeycombed by the frost of the previous night, crunched under my feet and at last betrayed me. I caught a glimpse of the pair as they cleared the wall and a good view as they loped gracefully up the hill. One was large and dark, the other smaller and lighter in color, male and female undoubtedly.

Twice before I had heard the fox bark by day. Both times I was quite sure it was a lonely male advertising his bachelor condition; on this occasion I imagine it was the female reproving a too ardent admirer.

Will W. Christman.

Old Time Numbers of Antelope.

Albert Lea, Minn., Jan. 26.—*Editor Forest and Stream:* In the summer of 1873 with a companion I took a river boat at Prairie du Chien, and went down to Burlington, Iowa. There was a merry crowd on the boat. The scenery along the Mississippi was grand, between lofty bluffs—many wooded to the top—while on the other side were almost bald peaks of great height. One never tired of this wonderful panorama.

From Burlington I went west to Salina, Kan., on the Kansas Pacific—or buffalo route—thence I went on foot up the Salina River, a long, hot walk of about forty miles to the northward. I saw great high points of bare rock with the country rising on either side into great divides. I came to a great sheep ranch and saw herders sitting about on their horses with rifles in hand protecting the sheep from coyotes.

As I came out into the more open country I could see thousands of what I supposed were sheep, but could see no herders, and as I wondered at this I saw one of the animals running past at short range, and for the moment it looked like a small deer. Then it came to my mind it was an antelope.

For me to undertake to give numbers is useless, as there were bands of hundreds as far as the eye could survey, and here in this clear atmosphere that meant many miles. One would suppose that such numbers could never be killed off. Yet like a mist they have faded away before the white man's smoke and gone with the red man to the plains beyond. H. B.

Sane, Simple and Scientific Game Laws

Bennington, Vt., Jan. 28.—*Editor Forest and Stream:* Since the publication in your issue of Dec. 31 of my article on the importance of fish and game protection, I have received a number of inquiries from your readers, and from the tenor of several of these I am afraid I did not make myself as clear as I had thought I had. A sportsman from New York State, who is a member of the present assembly, writes me: "I was very much interested in your story, but in some respects it was rather vague, and I am sorry you did not go more into details so we could all understand just what you mean by 'sane, simple and scientific game laws.' Can you not do this in a later number of Forest and Stream?" I must confess that I had thought these matters so thoroughly understood that they needed no detailed explanation.

I must give the protectionists' ideas of scientific laws first. In framing a law to protect a certain species of fish, bird or animal, we inquire: When is the pairing or mating season? Next, what is the period of incubation or gestation? Then, how long a time do the young of this species live by the aid of the parent fish or animal, etc. This information being scientifically determined, we must insist upon an absolute close season for the fish or animal during this time, and not permit them to be molested or disturbed under any consideration. But how is the ordinary sportsman to obtain this information? We cannot all be skilled naturalists and fish culturists. It can usually be obtained from your State commission, but if you do not care to consult the commission, call upon the Federal Fish Bureau or the Biological Survey. In those departments are trained experts who will be only too glad to furnish you with the desired information at any time, and their data may be thoroughly relied upon.

The next consideration is to so arrange our open seasons with regard to the means used in taking the fish or game, and the bag limit per day and season to each individual sportsman, that, as near as we can estimate, only the normal increase will be taken from the waters or covers each year. As Mr. Burnham well puts it: "The ideal game law is one so arranged as to season and method of hunting that no more than the increase of any game variety is killed during the open season, so that a sufficient breeding stock is left over each year to maintain the supply. When this balance is seriously impaired, the extinction of the game is only a matter of time."

It ought to be plain to all sportsmen that when they see the supply growing short this extinction is being accomplished. It is difficult to get absolutely reliable and correct information upon the question of decrease, but the State commissions keep in close touch with the different localities in the State and can estimate very closely, while another source of information is to be found at the meetings of sportsmen's associations and organizations of wardens. At times the question is obscure, but we can draw in our lines from time to time and take care not to go amiss. Any law not founded upon the above principles is not a protective measure and should not be permitted to parade under the guise of such. People are always desiring to loosen the lines and let down the bars by legislation, so they can take more game or fish, and their representatives in the Legislature are prone to assist them to accomplish this end and to forget the vital principles involved. This is just where the real advocates of protection must keep constantly upon the alert and forestall such efforts.

By "sane and simple laws" I mean laws in simple and plain language, without too much legal verbiage, so that all laymen may understand them when read, and so that courts will have no difficulty in interpreting and construing them when cases come up for adjudication. By sane laws we mean those framed by practical men familiar with the field work of enforcing these laws. No lawyer, however great in his profession, can draft good working game laws unless he is familiar with the practical enforcement of such laws in the field. But this result can easily be obtained by combining the lawyer's efforts with those of the field staff of the fish and game department. A "sane" law should not contain too many technical restrictions, or the average sportsman will look upon it as ridiculous and be prone to disregard it altogether.

I believe the above embodies what the real protectionists are working for in the way of law—as far as legislative enactments will save our game and fish, and it strikes me that those legislators who desire to make a sincere effort to get good game laws upon our statute books need have no difficulty in getting accurate information upon the subject. Harry Chase,

County Warden.

The Razor-back's Work.

Hendersonville, N. C., Jan 28.—*Editor Forest and Stream:* Our State Legislature is now in session and all kinds of bills on the game question are up for consideration. The usual number of county game bills, of course. Heretofore bills for game protection and for fish protection also, but no provision has ever been made for wardens to enforce the bills passed. T. Gilbert Pearson has a good bill in view, and Mr. Dillard, of Cherokee county, has a bill that has much of good to commend it.

Without a license tax of $1 or $2 from each resident sportsman, I do not see the use of any game legislation. I sincerely hope that before all the game has been destroyed, as were the passenger or wild pigeons, our Legislature will be induced to pass proper laws. It takes money to protect game and fish, and if the sportsmen and those desirous of having game for the future do not care to pay the trifling amount of $1 or $2 each year for the proper enforcement of game laws, then we must make up our minds to have no game in the future. Remember the passenger pigeon; remember the buffalo.

The partridges (quail) are scarcer than I ever saw them in all my shooting experience of nearly fifty years. This is accounted for by the heavy and continuous rains last summer. Most of the birds found are in the uplands away from river and creek.

I have so far not shot a ruffed grouse or wild turkey this season. About a week ago I took about a fifteen mile walk after grouse in the mountains of Transylvania county, but not a grouse did I see. After a couple of hours my dog got pretty well disgusted and took little interest in the game prospects, but simply ran about in an aimless way.

The razorback hog has fulfilled his mission of

extermination, or nearly so, in those woods. Now a "no fence law" has been enacted up there, and if carried out the turkeys and ruffed grouse will still have a chance. But in much of the forest these razorbacks have gone wild, yet of course there are those who claim ownership.

It will be a grievous shame if this best of our game birds—the ruffed grouse—be exterminated. They are fast disappearing from our covers, I am very sorry to say, and "what is to be done about it?" Ernest L. Ewbank.

Rain at Last.

San Francisco, Jan. 23.—*Editor Forest and Stream:* At last after a drouth that has lasted for several weeks, a heavy rain has fallen over the northern part of California and a great change in shooting conditions has resulted. Previous to about the tenth of January the bulk of shooting that has been done has been on the various preserves and along the Sacramento and San Joaquin rivers, for other shooting grounds were without water and feed. The fall and early winter were almost without rain and ducks did not scatter out over much territory but remained on the salt marshes and on the bay, where only a limited number of hunters were able to reach them.

Now much different conditions are ruling and the birds are to be found in almost every section in the great valleys of Northern California. The rain has been exceedingly heavy, forming immense ponds and raising the rivers to a high level and already grass is growing, attracting the birds, for green food has been scarce. The marsh districts have been almost entirely abandoned by the birds and in the interior the wide expanse of flooded areas makes hunting very difficult. On this account the bags that have been secured during the past couple of weeks have been light. There has been a general scattering of the birds and even the market hunters, who are usually enabled to secure full bags, are sending but small consignments to the local commission merchants. Practically no mallards or teal are now to be found on the preserves in the salt marshes but some canvasbacks are coming in from the bay, and as a result hunters are not neglecting their regular pastime.

Goose shooting is attracting many enthusiasts from the bay cities and most of these are making the trip to Rio Vista, although there is now some sport to be had in the country around Tracy, the recent rains having brought up the wild grass. The acreage devoted to wheat growing this year has been reduced and as a result geese are not scattering as much as formerly.

One of the immediate results of the rain in the interior has been to bring in great numbers of English snipe and some fine sport is now being enjoyed with this shore bird. In the vicinity of Newman the birds are plentiful and shooters in that district failing to secure limit bags of ducks have no difficulty securing a handsome showing in snipe.

The black brant season will soon be on and already some of the experienced shooters are making preparations to go after this waterfowl. Sea brant shooting is indulged in by but few here owing to the uncertainties of the flight of the birds and the fact that their habits are known to but few. These birds are to be found principally in Tomales Bay and are usually shot from a moving boat about nightfall, a feat that is a severe test for marksmanship.

The rainy weather of the last couple of weeks has kept quail hunters from venturing forth, as a journey of no small distance now has to be made before it is possible to reach grounds where satisfactory results can be secured. During the clear days that occurred during this time the local sportsmen have been attending the aviation meet being held at San Francisco and but few sporsmen have been making long out of town trips. Those interested in quail hunting are watching with interest to see what will be done by the State Legislature in regard to stopping the hunting of this bird from automobiles. A measure to prevent hunting in this manner is to be presented to the lawmaking body, as well as one that prohibits all hunting from aeroplanes. The best quail shooting that is now to be had is in the vicinity of Folsom and in the Grass Valley.

The experiments that have been made for some time by the California State Fish and Game Commission with game birds of various kinds are not meeting with much favor with some local sportsmen. They declare that it is a waste of time and money to attempt to introduce birds that in all likelihood will never thrive here and advise that more attention be paid to the preservation of the varieties already here. They point to the fact that in most sections of the State quail are becoming very scarce and advise that urgent steps be taken toward protecting these birds and increasing their numbers. A. P. B.

Death of Samuel D. Kendall.

Tarpon Springs, Fla., Jan. 25.—*Editor Forest and Stream:* Captain Samuel D. Kendall, better known to your older readers as "Tarpon," died yesterday at his home in Tarpon Springs. He was in his seventy-second year, and had been failing for many years. His disease was a creeping paralysis, perhaps induced by a severe accident long ago, which disabled him for a time.

He was born in Pepperell, Mass., in 1838, had known Prescott, Whittier and other famous men, and was a man of very wide experience, extending from Siberia to points south of the equator.

Captain Kendall had sailed the seas for many years, and had served with credit during the Civil War, in both the army and navy of the United States.

I have often thought it a pity that he did not take the advice of Charles B. Reynolds, and write the story of his life, but although he had often had it in mind, he could never decide to take up the work.

I accompanied him on his last canoe trip, some four or five years ago, but although he enjoyed it exceedingly, he worked too hard, and at last gave out, so that I towed him some ten miles to his landing, behind my own canoe.

When in the mood for talk, he was a very interesting man to his listeners, but for a long time his powers of speech had almost entirely failed. His funeral was largely attended by those who knew him. His widow survives him.

Kelpie.

Massachusetts Legislature.

Boston, Jan. 28.—*Editor Forest and Stream:* The Legislative Committee has held hearings on several of the sixty-seven different bills referred to it. One is to open the shooting season on upland birds on October 12 (Columbus Day) instead of October 15. This was opposed by the State Association, by H. A. Estabrook, of Fitchburg, and several others, who took the ground that the present open season was sufficient, and in fact all that our supply of those birds, especially of ruffed grouse, would stand. A bill for further extending the close time on wood duck for a period of five years was supported by Dr. Field, and met with no opposition. A bill, 622, for an open season on male pheasants was advocated by several men from Lynn and Swampscott and representatives of sportmen's clubs and met with no substantial opposition.

The work of the State in rearing and liberating pheasants has not met with hearty support from the men who shoot over dogs, and wherever those birds have become plentiful complaints have been made by the farmers of damage to crops. The gunners of Essex county hold the belief that they have driven out the native birds. The witnesses before the committe stated that foreigners, without licenses, have been killing a good many and they wish the opportunity to shoot the cocks legally. There was no substantial remonstrance against the bill.

House bill 194 to extend the time for protection of the heath-hen on Martha's Vineyard met with no opposition. Dr. Field stated that the birds are increasing in numbers, there being at this time over two hundred birds of this species on the island.

The hearing on House bill 196 was one of unusual interest. This is a bill to prohibit the use of scented bait without permission of the land owners in trapping. Ex-Congressman John R. Thayer, of Worcester, the author of the bill, argued in support of it. He frankly acknowledged that his purpose was to protect the fox. He said: "I do not object to the man who runs foxes with dogs: to the man who goes out with a bottle of stinking stuff in his pocket and sets traps all around, not visiting them for a week or more I do object." He declared this a common practice in Worcester county, foxes, and sometimes dogs suffering starvation and thirst for more than a week.

The increase in the price of furs had given an impetus to this method of trapping. He declared that two employees of the Worcester and Southbridge Railway gave up their jobs and devoted a month to trapping and in that time caught twenty-two foxes, four dogs two coons, one cat and a hen. A Charlton man's pointer dog was found nearly exhausted in one of these traps. Mr. Thayer was supported by President Charles, of the State Association. Representative Washburn, of Worcester, and W. C. Adams, of the Massachusetts Gunners' Association.

In remonstrance Hon. C. M. Bryant, of Quincy, claimed that the poultry raiser should receive as much protection as the fox. He spoke in behalf of the Massachusetts Poultry Association of which he is president. He said that during the past year he had caught three

or four foxes and had lost more than 100 hens.

Our State Commission has asked for legislation on several subjects, the first being a repetition of the request of last year for authority to lease, purchase or construct one or more suitable fish hatcheries. The board claims that the State requires not less than five million fry and one million fingerling trout, and other desirable species. It is impossible to depend upon commercial sources for stocking public waters and that the hatcheries now owned by the State are entirely inadequate to meet the requirements.

I doubt if there is anyone who will deny these allegations as regards the present hatcheries or the needs of our trout streams.

Henry H. Kimball.

Seizing Game.

New Orleans, La., Jan. 20.—*Editor Forest and Stream:* Attorney Amos L. Ponder, of the State Game Commission, has instituted criminal proceedings against several express companies for receiving game for shipment that was not tagged as the law requires. Mr. Ponder says the express companies are more to blame than the hunters and they should demand that the tags be placed on all shipments of birds. However, there seems to be no evidence of a studied attempt to violate the law, and he believes it is more negligence than malice, as the shipments have come from small railway towns or stations where the agents are not as careful as they should be. From Dec. 7, 1910, up to the present time there have been 3,000 birds valued at $1,000 confiscated on account of the failure of the shipper to tag them legally. The shipments when confiscated have been sent to various hospitals and charitable institutions in this city. The law in regard to tags was passed last summer at the meeting of the Legislature, and it is certain that scores of people failed to inform themselves on this subject.

Dr. A. K. Fisher, of the United States Bureau of Biological Survey, will visit New Orleans during the coming week. He will make a special study of birds. He desires especially to get several specimens for the Department in Washington of blue geese, which only can be found at the mouth of the Mississippi River. Dr. Fisher will be granted permission to kill the birds he desires for scientific study during his stay here. He will go from New Orleans to Brownsville, Tex., to continue his investigations. Dr. Fisher will hold a conference with the game commission and make an address on the subject of birds and especially that class which destroys the boll weevil.

A large number of visitors are in New Orleans to spend several weeks, and many of them will remain for the Mardi Gras festivities in the latter part of February. Some of the visitors are taking advantage of their stay here to enjoy hunting expeditions and fishing frolics.

The hunting season is fast coming to a close with a very satisfactory record. It is thought the reports of the various wardens will show that more deer were killed this season in Louisiana than last year. Ducks have been plentiful in certain places, especially about Lake Arthur, Lake Charles and the Jump near the mouth of the river and in Plaquemines parish. Brant and wild geese were killed in large numbers. The Game Commission estimates that there are more quail in Louisiana this season than ever before and the numbers are constantly increasing. Wild turkeys were brought to the market in fairly good numbers. Muskrats have been hunted very generally, although not as many were shipped from Louisiana this season as last year.

Secretary Babington of the Game Commission has gone to inspect the former State biological station building located in Cameron parish at the mouth of the Calcasieu river. This building was deeded by the present Legislature to the Game Commission and it seems probable it will be removed to a point either in or near New Orleans and used as headquarters of the officials in charge of the fish hatcheries and game wardens. The structure is in excellent condition and originally cost $8,000.

F. G. G.

A Tagged Black Duck.

New York City, Jan. 20.—*Editor Forest and Stream:* While shooting on the marshes of the Pocahontas Fowling Club, at Munden, Va., last Monday, Jan. 16, I shot a blackduck which was in a flock of four or five others, and on retrieving the duck I found that he had a tag around his leg, both of which I inclose to you, and wish you would inform me, if possible, where I can find out anything about the person who put the tag on the duck, or whose duck it is.

Spencer Aldrich.

[The tag is a white metal band stamped with the number 703 P. In our issue of Jan. 14, 1911, there is a notice of a tagged mallard. In November, 1907, a redhead duck tagged with a band marked T. J. O. D.—49 and a canvasback with a leg band T. J. O. D. No. 48 were reported killed in New Jersey. The tags in question are not those of the American Bird Tagging Association. Who is tagging these birds?—Editor.]

Ducking at Currituck.

Waterlily, N. C., Jan. 28.—*Editor Forest and Stream:* Duck, goose and swan shooting at Currituck from Christmas day to Jan. 15 was the poorest I have seen it for many years. The birds would get up at daylight and often before and go into the ocean and never return until after dark, but they did not do this last week, and some fine bags were made. To-day they are exceedingly abundant, so I think the shooting will be good for awhile. I had some friends from Newark, N. J., Messrs. R. D. Unger and Charles Keim, who came to shoot geese and swan especially, and while they did not make any large bags any day, they took home with them several hundred pounds of geese and swans.

More Anon.

New York Legislature.

Albany, Jan. 30.—*Editor Forest and Stream:* The following bills amending the forest, fish and game law have been introduced in the Legislature:

By Senator Thomas and Assemblyman Miller, relating to suckers, eels and dogfish in Otsego county.

By Assemblyman Wende, relating to mullet, suckers, carp and catfish in Lake Erie.

New Publications.

The Powers, Duties and Work of Game Wardens, by Harry Chase. Pocket edition, paper, 50 cents. Published by the author at Bennington, Vt.

The time is passing when the position of game warden is one to be given to the man who is willing to give half-hearted attention to it, and not be too severe on those who regard their acts as above the law. Harry Chase, as our readers know, is county warden at Bennington, Vt. He is one of that little group of men who have made a study of game protection, and adopting it as their profession, have by their acts and teachings aided materially in elevating the cause to the high place it occupies to-day. Harry Chase loves the work, for it takes him abroad during all the varied moods of nature, and he is an enthusiastic leader in present-day protection, which argues for timely preventive measures rather than severe punishment. Being a graduate in law and a sportsman, he is qualified to write a treatise on the legal and moral aspects of the cause. The book is one every sportsman, as well as every protector, should read. Some of the subjects treated at length are:

If two men are hunting and both kill a deer or fox or rabbit, which does the game belong to? What is the good of a six-inch trout law? Has a warden a right to search a person for illegal fish or game? Can a man shoot a deer or other protected game to save his property? Are game laws constitutional? Must a warden show his warrant to a person whom he seeks to arrest? What is the proper way to plant trout? What is the best way to fight forest fires? How shall I prepare a deer head or fish for mounting? Does the man who steals animals from my traps commit larceny? If I am trying to arrest a man and he runs away, can I follow him and arrest him when I catch him? What is meant in law by an arrest, anyway? Can a justice take jurisdiction over a case if no formal complaint has been made to him? How is a formal complaint prepared? These and hundreds of other similar questions are all answered. The information on legal matters is culled from the best authorities in the United States. All decisions of the Vermont Supreme Court applicable to fish and game cases are cited. The best authorities on scientific fish culture are freely quoted. Several chapters on the detective work of game wardens are given. The full meaning of fish and game protection as it is understood in this country is reviewed.

Camp Cookery, by Horace Kephart. Cloth, 154 pages, illustrated, $1 net. New York, the Outing Publishing Cofpany.

Of a size to fit snugly in a corner of the camper's grub box or pack, Mr. Kephart's latest book is a mine of information on cooking and all the allied subjects leading up to a square meal in camp. There are recipes galore, while several blank pages in the back of the book are left for others the possessor may pick up here and there.

The Outing Company has issued, in its Robinson Crusoe Library, Kephart's "Book of Camping and Woodcraft," and "Camp Cookery," and Dr. Charles S. Moody's "Backwoods Surgery." The covers are flexible leather, the price of the set $4 in a durable cloth holder.

SEA AND RIVER FISHING

"Well, Sir! Once—."

V.

"A SHARK came near getting me in trouble, and with a big man, too," said the next man to the front. "At least I guess it was a shark, as I know of nothing in the water whose first rush is as savage. My wife and I were spending the winter on the west coast, fishing whenever the weather would permit. The little woman was having her first experience, and was having such good luck that she was getting quite cocky over her skill as an angler, and rather inclined to give advice and make suggestions to others. There came to the hotel a big fellow, six feet four, weighing near 300. He was a fresh water fisherman, had fished for everything from muskie to brook trout, but had never been on salt water before. He went down on the dock with me the first day and was much interested in the variety of sport offered. I was trying for channel bass with a heavy handline, and got two fish that day, one weighing nearly fifteen pounds. The big man begged to accompany me next day, and I gladly accepted his company, as he was a good fellow, college man and all round sportsman. We went after noon and our better halves were to join us later on. I took my usual outfit, and he brought a fine trolling line, such as he had been using in fresh water. I suggested that the fine line would cut his hands pretty badly if he got a heavy fish on, but he said he was used to it and would take chances. I caught a shiner for each, baited up and got the big lines out at once. For some time we had no strikes, and then I caught a small grouper. A little later my friend had a good strike, but did not hook his fish. When I got him baited up again he took his stand on the edge of the dock, holding the line firmly in both hands. A coil of slack lay at his feet, and the end was tied to a large spike in the edge of the dock. He was a 'broth of a boy' and looked fit to handle anything in or out of the water.

"'I've got a strike,' he suddenly called. 'Shall I give it time, or jerk quick?'

"'Time,' I said. 'Wait, I'll tell you when.' Just then our wives approached, and were at once interested. As the line straightened out I gave the word, and with a mighty swing the hook struck home. It must have been a five-foot shark, and the holder of the speed record that he hooked. There was a hiss, a sharp tang like the snapping of a violin string, a grunt from the big man, and it was all over. As the big fellow stood there looking down at his hands, burned to the quick, as though trying to realize what had happened, the amateur rushed in where veterans would have feared to so much as look.

"'What did you let him get away for?' she shouted. 'Why didn't you hold him? You ought to have held the line and played him—worn him out. Why, my goodness! You ought not to let such a fish as that get away!'

"She was not through, but the look he gave her caused her to pause. I thought he was going to box her ears, and while standing ready to defend her, really sympathized with him.

"'My dear madam,' he said, and his voice was like cold steel, 'may I assure you that I did not let that fish get away—that a steel cable could not have held it? Glance at my hands and see the wounds I suffered in trying to check it, and say whether you think I let it get away,' he said in a final burst of sarcastic wrath, and taking his wife's arm, he stalked off. They left that night, and I was glad of it, for I could never have felt easy in his presence again."

I was putting up my tackle, when one of the party inquired: "Did you ever see flyingfish in Indian River?" The man addressed promptly replied in the negative.

"No flyingfish in Indian River," said another. "Flyingfish are only found around the South Sea Islands."

"So I thought, until a few years ago, when I was called upon to verify a story of flyingfish in the Indian River," said the man who had asked the question. "Before the railroad was finished further than Rockledge it was a delightful trip down the east coast on one of the boats, provided you were in no hurry and did not mind getting hung up on a bar occasionally. As one known to be pretty familiar with the east coast, I was called upon by two young women, just returned from a trip down Indian River, to verify their story of flyingfish there. I thought a moment, and then felt sure I had it, the great mullet, jumping again and again with long leaps from the water. I explained that they looked like flyingfish, but were not, but wonderful jumpers. But they would not hear it. 'We know them,' was the positive reply. 'They are not what we mean. We saw fish rise from the water and fly off,' said one. 'Fly high in the air,' said the other, most positively. 'Clear out over the land, and out of sight,' said the first without batting an eye.

"I knew the young ladies were truthful, and meant what they said, and also—more marvelous—believed it, too, but what on earth they could be talking about I did not know. Fish rise from the water and fly out of sight over the land! I did not remember any harder nut than that to crack in Baron Münchausen's repertoire. I questioned and cross questioned, but never moved them. They had seen it all with their own eyes and were half inclined to feel offended because I had not seen it, too. I finally solved the puzzle. They had seen fish hawks rise from the water and fly off to the woods with their prey without having been close enough to see them distinctly, and without having observed their lightning-like dash into the water, and had identified them as flyingfish. I am pretty sure I reached the correct solution, but the young women have never been wholly satisfied, and I do not rank as high as an authority with them since they saw flyingfish in the inside Florida waters, and I did not."

LEWIS HOPKINS.

Fishing in Natal.

IN the British Sea Anglers' Society's Quarterly, C. E. Merrin writes as follows of the fishing to be had in Natal, South Africa:

In order to understand the sort of fishing we get at Durban, I must explain that practically all the sporting fishing is done from the piers, the rocks and the shore. The sea is generally so heavy that it is too dangerous to go out in a small boat, and though occasionally parties are taken out in a tug, they are made up from all classes of people, some of them very bad sailors, so that in rough weather they are miserable and make things uncomfortable for others.

In order to fish with success it is necessary to learn to cast very far, so as to get well clear of the rocks and concrete boulders at the feet of the piers and along the shore. We all use very long rods of male bamboo (about twelve feet), which we make up ourselves by whipping at short intervals so as to stiffen them, and mounting them with porcelain rings, which do not wear or cut the line so much as those made of wire. My reel is one of eight inches in diameter and has a six-inch drum, so that for every revolution eighteen inches of line is cast off or reeled up as the case may be, and I think the size of the reel is a very important matter in this class of fishing, as when a fish runs toward you, you can always keep the line tight by reeling very fast. A big fish generally makes out to sea as quickly as it can, and when it is checked usually turns back again and makes towards the pier, so that if you cannot line in quickly and keep the line taut, the fish will make a loop in it and then it gets its tail round it and snaps something. I have seen this happen with a six-inch Nottingham reel. A fish after getting 150 yards of line out turned back and came in suddenly. The fisherman thought the fish was lost and was winding in the slack line when there was a sudden jerk and the fish broke the line and departed in earnest. My reel holds about 300 yards of the usual No. 4 line, and I have had a fish on that took out about 250 yards of this before it could be stopped. My reel is held to the rod by a little contrivance of my own invention, as we find that with the large fish an ordinary holder is liable to work loose so that the reel falls off, to obviate which we have always had to tie our reels on, but with my invention there is no necessity for this. The fish we catch may be any weight from five pounds upward. The largest landed yet by a rod was a shark of 227 pounds, another of nearly the same weight took the angler three hours to land, and then he could only do so by beaching it. We find the single strand piano wire, galvanized, the best for casts and traces, and we use no booms because they would be liable to catch in the rocks in hauling in, and when the line was cast out they would merely lie on the ground and be of no practical utility. We generally cast about seventy-five yards with trace and bait, and my longest cast on shore on the flat was eighty-three yards.

As regards bait we have no great selection, but for fishing all the year round I consider the gray mullet the best. We have also the shad, which is very good and some prefer it to the mullet, but it is very soft, and small fish bite it off leaving only the skin. Sometimes we use prawns which are as large as the middle finger and very good bait. All fish take them and the Cape salmon are very fond of them. The barracuda is not only a very fine fish and a splendid fighter, but an excellent bait, as the flesh is very oily and rich. It comes at a season when all other kinds of bait are scarce. We generally cut it up and salt it over night to harden it. There is a small fish called carrantine which is a very dirty feeder. It is something like sea bream, but has yellow stripes. It is put on whole and is a deadly bait for some kinds of fish. "Cracker shrimps," which are like a miniature crayfish, are very good for the smaller fish. The Indians use them a great deal. We have what we call rock bait and the Dutch *rooihaas*. It is a shell fish something like a scallop with a red inside. We skin off the hard exterior and take out the center. We also use cuttle fish, and small octopus, and a bait called sea lice, which are caught from the beach in a wire net as the waves recede from the shore.

Now as to the different kinds of fish: To begin with the kingfish, which is very difficult to take and is hardly ever captured with a dead bait. We mount a mullet with two hooks in the tail and one in the chest and bring the wires out of the mouth to a swivel at the end of the wire cast, throw this out into the water and troll it along until the kingfish comes up and snaps at it. The water is so clear that we can see them waiting for the shoals of mullet and going for the bait. Even when hooked it is very difficult to land them, and they have been caught up to 122 pounds' weight. One of the best known and largest fishes is the Cape salmon, which is no relation to the real salmon, but a white-fleshed fish allied to the perch. It is very bright in color and looks beautiful when it comes out of the water. The Cape salmon has been described as a very game fish, but that is not my own experience, as I have found that it usually gives one good run and then comes up flat on the side and is easily killed. It bites very softly, much like the conger, so you must not strike at the first nibble or you are likely to lose the fish, and the mouth is very tender, so you must be careful in landing it.

The grunter is a splendid fish and excellent eating, and a good fighter on light tackle. It gets its name from the grunting noise it makes when it is caught. It grows up to about fifteen pounds, the mouth is very small, and small hooks must be used with prawns or shrimps for bait.

The mullet, which is a very common fish, is very shy, and is seldom caught with rod and line. The Indians, however, catch a good many, using bread or paste for bait and floating out their line with a number of little corks all along it. The mullet are eaten a good deal, but they are full of intestinal worms, and I never eat them myself.

The shad come round our shores in large numbers at certain seasons and the porpoises follow them and make great havoc. They give great sport for such small fish and they can bite through gut traces. They are rather dry in flavor unless put in the pan at once when taken.

The rock cod is a very splendid fish and excellent eating. It feeds about the rocks, and when hooked makes for some hole or crevice and plunges in, but if you hold on for a long time and keep quiet, it may come out again. This fish grows very large, though really large ones are very seldom caught on account of the difficulties with the rocks. However, one of seventy-two pounds was taken the other day. There is a well known one that lives under the Durban wharf. It must weigh between fifty and one

THE LEAPING BLACK BASS.

A 3¼-pound 19-inch small-mouth black bass on the line. Caught and photographed at Lake Cecebe, Ontario, by Fred H. Smythe. Courtesy of the Zoological Society Bulletin.

hundred pounds, and many people have tried to catch it, but though the bait has often been dangled over its nose, it has never taken the hook.

Our South African bream are not like yours, for they are white with a yellow stripe along the side. One of thirteen pounds which I caught gave me all the play I wanted. Another kind called the rock bream is not so well known. It frequents rocky bottoms in the surf and bites ravenously at rock bait, but is full of worms and we never eat it.

The barracuda is a grand fish and one of the best fighters we get on the rod. It runs out a great deal of line and jumps frequently from the water. It is caught from a boat by using a piece of red flannel instead of a rubber bait, but it does not take dead bait unless by spinning. The barracuda is excellent eating when served with egg sauce. I got a thirty-pounder one day when fishing in the channel on a very strong tide, and had to play it for half an hour before it could be gaffed.

Another local fish is called the "prodigal son," or Portuguese salmon, and it somewhat resembles the barracuda, and is also very hard to catch and runs out the line so fast as to burn the fingers in trying to brake the reel.

The mussel cracker is quite a different fish from all the others, both in its shape—which is short and stout built—and also in its habits. It lives on crayfish and other crustaceans and is only caught right among the rocks when it comes to feed on them, so that when hooked it has to be steered through the narrow channels among the rocks, which is a very severe test of the fisherman's skill. On account of its diet it has an excellent taste, and it is, I think, the best fish in the colony.

There are three kinds of sharks which are pretty common: the man-eater, the hammer-head and the sand shark. The man-eaters are, I believe, the same as the blue sharks known in Europe. They are very numerous and we catch a great many of them and would catch more if they were not rather too big for us. The largest that has been caught on rod and line weighed 227 pounds, and it was landed in the dark. My own largest weighed 156 pounds. They run out so fast when hooked that they burn the fingers and even a coat sleeve in trying to brake the revolutions of the reel, and they often leap out of the water.

The hammer-head is also a very fast swimmer and fights splendidly, rushing all over the place, and in and out of the rocks. It is called a hammer-head because the head is shaped like that of a hammer, with the eyes at the ends.

The sand shark is not often caught, as it has a smaller mouth even than the man-eater. In shape it is between a shark and a skate. It has two large dorsal fins, and when being brought in, these two fins and the tail stand out of the water and look like three sails of a boat. When caught it always comes in sideways, working all its flappers and fins as hard as it can. The largest yet caught weighed 208 pounds, and the man who caught it was quite dead beat with the hard work.

We also have our skates, which are quite different from those in this country; the largest caught was 156 pounds. One day the Indians caught a large eagle ray, which took about 150 of them all they could do to haul it up the beach. It was taken on a truck to the place where the coal wagons are weighed, and its weight came to about ten tons. We also got a large sunfish one day near the wharves, and it had to be hauled up with the derrick of a ship, as it weighed over a ton.

There are many other kinds of fish which I have not space to describe, such as "black-tail," "soldiers," "springers," "slingers," "scavengers" and "ribbon-fish." At times shoals of sardines come round our coasts, followed by all sorts of large fish, which is very good for sport. Occasionally a turtle is caught. A man saw one one day near the pier and threw his line over it with bare hooks. It was caught in the turtle's flapper and with a great struggle it was landed on the beach and it weighed 120 pounds.

Big Fish.

New Orleans, La., Jan. 27.—*Editor Forest and Stream:* A. B. Sabine, residing in this city, sent to the Daily States a picture of a swordfish which he caught off Horn Island in the Gulf, near the Mississippi State line. This monster weighed 1,000 pounds and was caught from the deck of a schooner about four years ago with a rod, reel and line by Mr. Sabine, and it is claimed it is the largest fish ever landed with rod and line. The Daily States some days ago published a picture of a sawfish weighing 800 pounds, caught recently by a rod and line off the Florida Keys, and the claim was made that it was the biggest fish on record caught in that manner. Mr. Sabine now claims this honor and produced the picture to substantiate his claims.

E. A. Tulain, the State superintendent of fish hatcheries, has arrived and will at once begin his work. Mr. Tulain says that his first work will be devoted to saving the fish and spawn in the various streams of this State. He asserts that fish often lay their eggs along the banks of a stream, and when the water recedes, the eggs or young fish are devoured by birds or otherwise destroyed. He proposes to save as much of this spawn as possible by placing it in deep water. Mr. Tulain will bring a great many black bass from the North and place them in the streams in Louisiana. For the next fortnight he will devote most of his time to the office work of the game commission, and after that will make a tour of this State for the purpose of selecting a suitable location for several fish hatcheries. Mr. Tulain is regarded as an expert on fish subjects, having had many years' experience in the employ of the United States Government. He spent several years on the Great Lakes, various portions of this and other countries. His home is in Florida.

Fishing has not been so good in the past fortnight and very poor luck is reported. A severe cold snap lasting several days recently seems to have hurt fishing to a great extent. The waters were chilled and the fish failed to bite. It is expected that the waters along the Louisville and Nashville road near New Orleans will improve, and fishing will be more popular.

Commissioner Frank M. Miller and E. A. Tulian, superintendent of fisheries, have gone on an inspection trip for the purpose of determining the value of Lake Catherine as the proper place for a black bass hatchery. They will also inspect Lake Borgne. It seems probable that Lake Catherine will be selected, as a good many bass flourish in these waters. The lake is comparatively shallow. A great deal of interest is being taken by the fishermen in this tour. The sentiment seems to favor Lake Catherine, which is only about twenty miles from New Orleans. Mr. Tulian will make a tour of the State for the purpose of inspecting the various streams and the location of fish hatcheries.

The warm weather of the past two weeks has been favorable to the fishermen and not a few of the lovers of the reel and rod went over to Lake Catherine, the Rigolets, Chef Menteur, Waveland, the Barataria section and other fishing places and report very fair luck for this season of the year. A number of green trout, speckled trout and red fish were landed, but not in very great abundance. The waters are getting warmer and it is thought in the next few weeks fishing will be excellent, provided a cold snap does not intervene. At the present time there are a large number of winter visitors in New Orleans and these numbers will be augmented as the time for the annual Mardi Gras approaches. The clubs on the Louisville and Nashville road have had as their guests a number of visitors who are enjoying fishing in the salt waters.

The Game Commission is experimenting with catfish skins as material for leather goods such as purses and gloves. Recently the skin of a large catfish from Berwick Bay was tanned by the commission and proved satisfactory. It is predicted that this experiment will open up a big commercial enterprise. Catfish are very abundant in Louisiana, and if the skins can be made into purses, gloves, etc., successfully, it is certain that a company will finance the scheme. The tanned catfish skin is on exhibition in the exhibit of the Game Commission in the new courthouse building, and has attracted considerable attention and caused no little comment.

F. G. G.

Striped Bass Scarce.

San Francisco, Jan. 23.—*Editor Forest and Stream:* Trout fishing in California during the season of 1910 was the best that had been experienced for a great many years owing to the fact that streams were well stocked and there was but little trouble with high water. This fish afforded the best sport of any of the finny tribe and many other kinds of fishing have proved very mediocre. Striped bass usually afford fishermen excellent sport in the vicinity of San Francisco Bay and the Sacramento river, but this season but few fish have been taken, notwithstanding the fact that great crowds of anglers have visted the fishing grounds, and attention is being turned from this fish, as a result, to steelheads and salt water fish. Just why such poor striped bass fishing has been the rule had not been explained, for the market fishermen have been fairly successful, but the fact remains that the bait casters have had the poorest success in many seasons. The old fishing grounds have been practically deserted by the fish and the best sport is now to be had in some of the small lagoons in the vicinity of Napa Creek.

Some excellent steelhead trout fishing is now being enjoyed in tide water in the vicinity of Point Reyes, although the fish are running largely to small sizes. The recent rains have opened the bar across the mouth of the Russian River and that stream is now fairly swarming with steelheads. The freshets that have come down the streams have attracted the fish and where these streams empty into salt water some fine sport is being enjoyed. Prominent among the local steelhead enthusiasts is Dr. L. T. Cranz, who has just made a special fly that bears his name and which has proved to be one of the best ever used in these waters.

Salt water fishing has been excellent in the vicinity of Moss Beach and anglers hope that the railroad that has been constructed down the coast touching at all the beach points will be put in operation at an early date, for this will open a territory that is now reached only in a very roundabout manner and which is therefore but little visited.

A. P. B.

Some News and a Little Gossip.

The Rochester Y. C. has sent the following challenge to the Royal Canadian Y. C.

"We hereby challenge the Royal Canadian Y. C. for the Fisher cup, races to be best two out of three under conditions similar to those which obtained in 1907 for the Canada's cup. We ask you to waive the time limit for challenging and expressly stipulate that the competing yachts shall be selected from those which were built for the Canada's cup race in 1907, the contest to be held during the exhibition at Toronto on dates that may be mutually agreeable."

At a recent meeting of the Rochester Club, Eric Moore, owner of Seneca, placed that yacht at the disposal of the club as a challenger for the Fisher cup if a race could be arranged.

The Canadians have Eleanor, Aileen and Crusader with which to defend the cup. These yachts were built for the last Canada cup series which was won by Seneca. The Canadians have been expecting a challenge and are anxious to arrange a race. It is possible that as they want an international contest, they may agree to conditions as named by the Rochester Club. There is, however, rather a strained relationship between the two clubs which has grown out of differences of opinion relating to the Canada cup.

According to reports from Toronto, the Canadians are delighted that the Rochester Club has challenged, and they are confident that they will successfully defend the cup with one of the older boats. They point out that last summer Crusader defeated Seneca, but they admit that Seneca was not handled as well as she was when Addison G. Hanan sailed her for the Canada cup. A reply will be sent to the Rochester Club in a few days, and it is thought that this race will be the means of clearing the atmosphere and result in races being arranged again for the Canada cup which stands for the championship of the Great Lakes. Æmelius Jarvis will sail the defending yacht.

There is every indication now of the yachting world seeing some lively times. According to Stanley Seaman, a broker, business is improving and yachtsmen are making inquiries about yachts for the coming season. It is usually dull until February, and then those yachtsmen who have postponed ordering new craft find that they cannot have a yacht built in time for the season, and they begin to look about for one to suit their wants. The inquiries just now are for cruising craft, sailing and power, and the power boats are mostly in demand. There is a demand, too, for auxiliaries of all sizes, and during the winter several large boats of this type have changed hands.

The Larchmont Y. C., through Horace E. Boucher, chairman of its regatta committee, is trying to arrange a race around Long Island for the three-masted schooners Atlantic and Karina. Mr. Boucher last week received a cable from Commodore Leonard Richards offering a $1,000 cup for the race. The cable said:

"Offer a $1,000 cup for a race around Long Island between Atlantic and Karina. Finish off the Larchmont Y. C. Richards."

A match between the two schooners recently was suggested, but no club has as yet taken any steps toward bringing the big fellows together. The contest undoubtedly would be one of the most interesting fixtures of the yachting season and would do much to help along the sport. The two schooners are of a similar type, and although Karina is the larger, any advantage in sail spread that she might have would be offset by the lighter displacement of the Atlantic. Both boats are owned by keen racing yachtsmen who have often met in important contests. Atlantic was the winner of the transatlantic race for the German Emperor's cup, and in that famous struggle Robert E. Todd, then commodore of the Atlantic Y. C., sailed his schooner Thistle.

Speaking of the contest, Chairman Boucher said: "The offer of a cup by Commodore Richards for a race between Karina and Atlantic came as a decided surprise. I knew that the contest had been suggested, but had not thought seriously of including the struggle on the racing fixtures of the Larchmont Y. C. Now that Commodore Richards has offered so valuable a cup, I intend to see both Commodore Marshall and Commodore Todd, and find out if it is possible to arrange the match. The contest undoubtedly would be the most important event of what promises to be an exceptionally interesting season.

"Of course it is too early to decide upon the conditions, but if the owners are satisfied I would suggest that the race start off Sandy Hook and end off the Larchmont Y. C. The course is an ideal one for big schooners. It is the right length to give them a fine test and one that could be covered in a reasonable length of time.

"As Commodore Todd formerly was the senior flag officer of the Atlantic Y. C., and as Commodore Marshall once held the same office in the Larchmont Y. C., I think it would be a good idea to ask the Atlantic Y. C. to co-operate with the Larchmont Y. C. in the management of the start of the race. These points, however, would have to be decided after the yachtsmen have signified their willingness to race."

At the annual meeting of the Boston Y. C. last week the election of officers resulted as follows: Commodore, Alfred Douglas, schooner Shiyessa; Vice-Commodore, A. W. Chesterton, sloop Elaine; Rear-Commodore, Arthur Merritt, schooner Delma; Secretary-Treasurer, Walter Burgess; Executive Committee, two years, Chas. A. French, Charles E. Lauriat, George W. Williams, Arthur W. Moody; Membership Committee, two years, L. B. Goodspeed, chairman for one year, Walter Burgess, Edward E. Fowler, William L. Barnard; Regatta Committee, B. S. Permar, chairman for one year; two years, H. Lundberg, P. Wolcott Powers, Norman L. Skene, Charles W. Chapin.

The following section was substituted in the by-laws:

"The membership of the club shall be limited to 700, exclusive of honorary and life members and members of all other divisions, but in cases of yacht owners applying for membership, the committee is authorized to admit them in excess of the limit."

The forty-first annual meeting and election of officers of the Bunker Hill Y. C. was held at the club house recently. The following named officers were elected: Commodore, Joseph W. Callahan; Vice-Commodore, Fred Barret; Fleet Captain, William Foster; Directors, John E. Hayes, John W. Devine, Ralph Dorman, James T. Murphy.

The result of the election of the Albany Y. C. was: Commodore, Matt McCarty; Vice-Commodore, William L. Martin; Fleet Captain, C. R. Butler; Fleet Surgeon, Dr. B. E. Rinne, M.D.; Measurer, George C. DuBois; Secretary, A. M. Barto; Treasurer, F. W. Froelich; Board of Governors, Charles Munsell and Charles W. Bentley (two years); Inspectors of Election, E. L. Houston, Paul Hourigan and R. H. Miller.

The City Point Y. C., of New Haven, at its annual meeting elected: Commodore, H. E. Carlisle; Vice-Commodore, R. P. Christian; Rear-Commodore, James Swift; Secretary, R. J. Bennett; Treasurer, George Adams; Measurer, John Guest. Thomas McClusky was re-elected trustee for a second term of three years. The new commodore reappointed George Baldwin, fleet captain. He also appointed T. Plunket chairman of the regatta committee, R. P. Christian, chairman of the entertainment committee and Edward Manville, chairman of the auditing committee.

The Winthrop Y. C. has elected these officers: Commodore, David M. Wisely; Vice-Commodore, Harry W. Farquar; Secretary, Charles T. Bird; Treasurer, Joseph J. Deacon; Measurer, F. H. Byrne.

The Lakewood Y. C. at its annual meeting elected these officers: Commodore, Alexander Winton; Vice-Commodore, C. W. Kelley; Rear-Commodore, A. Y. Gowan; Secretary, H. B. Anderson; Treasurer, R. C. Herig; Directors, H. W. Card, E. C. Botten, E. L. Manning; Delegate to American Power Boat Association, Robert Deming; Delegate to Great Lakes Power Boat League, R. E. Power. The alternate delegates chosen are H. B. Anderson and M. H. Moffatt. There were two tickets in the field, but there was no opposition to Com. Winton.

The annual meeting of the Inter-Lake Racing Association will be held at Cleveland on Feb. 18.

The Toledo Y. C. has awarded the contract for the erection of a handsome new club house near the Bay View Park lagoon. The club has leased from the board of park commissioner, for a term of nineteen years, two acres of land surrounding the proposed club house.

The new officers of the Illinois Valley Y. C. are: Commodore, A. T. Griffith; Vice-Commodore, Robert Scholes; Rear-Commodore, H. E. Chubbuck; Secretary, Guy Goodfellow; Treasurer, J. N. Gift; Directors, S. L. Nelson, A. D. Campbell, Warren Cowles, E. H. Gower, J. P. Brady, J. M. Baillie, Walter B. Wilde, M. M. Baker and W. E. Persons.

American Y. C. House.

The American Y. C. at its annual meeting recently elected Joseph M. Macdonough, Commodore; Stuyvesant Wainwright, Vice-Commodore; Hobart J. Park, Rear Commodore; Dr. Carl F. Wolff, Fleet Surgeon, and William Porter, Secretary-Treasurer.

The club is to erect a new house on the site of the old one at Milton Point. Plans for this new home were approved and the directors were authorized to issue bonds for $100,000, the cost of the new structure. Work will be started at once, and it is expected that the new building will be ready for occupancy by the time of the opening of the season. The plans were drawn by M. Don Barber, a member of the club. The new building will be of stone and wood. There will be thirty apartments in it, fifteen baths, a drawing room, reception hall, billiard room, retiring room and a large veranda commanding a fine view of the Sound. The improvements will also include a swimming pool, new tennis and squash courts, and a brilliantly illuminated promenade about the grounds. A garage capable of accommodating forty-five automobiles will replace the present sheds.

Yachts Change Hands.

The following sales and charters have recently been made through the agency of Messrs. Cox & Stevens, of this city.

The 227-foot yacht, Kanawha, has been sold for the estate of H. H. Rogers to Abram Baudouine, N. Y. Y. C., who has sold the 170-foot steam yacht Hiawatha to J. B. Ford, of Detroit. Both these vessels are being overhauled at the yards of the builders the Gas Engine & Power Company, of Morris Heights.

The 170-foot steam yacht Lydonia has been sold for W. A. Lydon, of Chicago, to a prominent New York yachtsman. Lydonia is now at Chicago but will proceed to New York as soon as navigation opens in the lakes.

The 90-foot cruising motor boat, Kalmia, chartered for Hobart J. Park to H. I. Hosford, who is using her in southern waters.

The 110-foot auxiliary schooner yacht Haida, chartered for M. C. Fleischman to E. Mapes, who is now cruising in Southern waters.

Gasoline cruiser Shur sold for George Lane, Rochester, N. Y., to Thomas W. Jackson for cruising on Lake Ontario.

Day cruising power boat Dollie Bowen, sold for A. Laurence Kerker, of New York to William L. Mellon, of Pittsburg for use on Lake Muskoka, Canada.

Day cruising launch Silver Heels sold for J. Roger Maxwell, of New York, to H. C. Smith for service on Long Island Sound.

Express launch Dorodel sold for John G. Stuart, of New York, to Alfred G. Vanderbilt for lake use among the Adirondacks.

Auxiliary yawl Farfalla sold for Prosper L. Senat, of Philadelphia to T. D. Poucher, of New York.

Auxiliary sloop yacht Vayu, sold for Lucien Antoine, of New York, to Frank S. Evans, of Philadelphia, for cruising in Maine waters.

Raised deck gasoline cruiser Myth sold for Howard C. Smith, of New York, to Edward Van Dam.

Raised deck cruiser Julugra sold for Fred A. Mabbett, of Rochester, to H. L. Waterhouse, of New York.

Hunting cabin gasoline cruiser Barbara, sold for William M. Duncan, of New York, to L. A. Bampton.

Power boat El Vago, sold for Orient C. Pinckney, of New York, to W. P. Howes for service at Coatzawalcos, Mexico.

The following transfers of yachts are reported through the agency of Tams, Lemoine & Crane:

Motor yacht Tekla II., sold by Alessandro Fabbri, New York Y. C., to A. V. de Giocouria. Tekla II. was built by Lawley in 1909 and is 90 feet over-all, 17 feet beam and 3 feet 6 inches draft. She is equipped with two Craig motors of 60 horsepower each. Mr. de Goicouria will change the name to Vencedor, the name of a schooner he owned for several years.

Houseboat Nirodha, sold by W. P. Clement and J. E. Childs to Hugh D. Auchincloss. Nirodha was built for the late Pierre Lorillard and is 125 feet over-all. She is a steel built vessel and is fitted with two Craig motors of 75 horsepower each.

Houseboat Roxana, 114 feet long, chartered by Larz Anderson to C. K. G. Billings, who is using her at Miami.

Auxiliary ketch Savalo, chartered by H. E. Tuttle, to Richmond Talbot. Savalo is 67 feet over-all and is equipped with a 25 horsepower Standard motor. Mr. Tuttle will use the yacht for tarpon fishing.

Stories About Capt. Barr.

No yacht skipper was better known on both sides of the Atlantic than Charlie Barr. "Wee Charley" he was often called by his friends. He won fame in British waters with small craft, brought the Minerva to this country and raced her here. He looked on this land and found it fair, and while here he became the foremost skipper in the world, thrice sailing the defending yacht in races for the America's cup to victory.

It was just two years ago since Capt. John Barr, elder brother of Charley, died. John was more than twenty years older than Charley and many thought the elder Barr was father of the man who has just died. The ancestors of the Barrs were followers of the sea, and John when very young took to sailing small boats and while Charley, who was born in 1864, was serving an apprenticeship to a grocer Capt. John was winning fame as the skipper of a ten tonner named Ulerin. Young Barr left the grocer's business as soon as possible and took to the sea and from that time he steadily forced himself to the front and won in his career through life because he was plucky and skilful, loved his boat and the sea and because when he started to do anything he did it well.

Of course he began in the forecastle and served as a deck hand, as all good sailors have to do, but it was not long before his skill was recognized. He was engaged first with his brother, and when the summer season was over instead of returning to the grocer's shop he engaged to go flounder trawling on the middle reaches of the Clyde in an eight-ton smack, the wettest, coldest, dirtiest work to which man can doom himself, so that he might the quicker and better perfect himself in the difficult art of sailing a cutter rigged vessel.

Young Barr had not been long on board the smack when it became apparent that Fate for once wasn't blind when she beguiled this man to the sea. With the exception of himself the men in the smack were comparatively elderly men, and one bitter cold winter morning the little boat was caught in a shrieking nor'-easterly gale off Portincross on the Ayrshire coast three or four miles south of Fairlie. Millport was the natural harbor to make for but after several gallant attempts to sail the smack there it was apparent that she could not make port. The elder men had become enfeebled and disheartened when Barr, who had been working splendidly, quietly took the tiller and assumed command. Having seen how hopeless it was to attempt to beat the boat to a port of safety, he boldly put her before the wind and started to run to Androssan. The boat was only half decked and he had an awful time to keep her from being pooped by the bigger seas. Off the entrance to the harbor in spite of all his skill, she nearly foundered and he had to give up the idea of making Androssan and headed her for Troon, a harbor lying in the deep open bay a few miles to the south. The weather was becoming wilder and the outlook more desperate. He made that harbor but neither he nor his mates could ever coherently tell how it was done. The owner of the smack, a fine old Clyde fisherman named John Campbell, never wearied of telling, however, that 'there was nae doot whate'er they would a' hae been droon't but for young Charlie's pluck an' skill."

That was the training of this genius. A Scotchman by birth, a sailor by nature, a grocer by early training and navigator and helmsman of imperishable fame by dint of indomitable will, unequalled skill, infallible judgment and an irrepressible love of boats and all that pertains to them.

It was not very long after this experience that the two Barr brothers crossed the Atlantic in the cutter Clara, a 40-footer owned by Charles Sweet. Capt. John was skipper, and the voyage across the Atlantic was a long one. Next they were together on the Scotch challenger Thistle in 1887. Charlie was a sailor on that yacht, and it was his first experience in a contest for the America's cup. He returned to Scotland, and in 1888 brought across the 40-footer Fife designed cutter Minerva and for three years raced her successfully in these waters. Eighteen 40-footers were built here before Gossoon was turned out to defeat the crack Scotch cutter. Charley next commanded the Burgess cutter Oweenee and then handled the Wasp, owned by Archibald Rogers. It was on this craft he said he had the worst voyage in his experience. The Wasp was one of the first of the spoon-bowed yachts and in going around Cape Cod she was caught in a hard blow and pounded so that Captain Barr said he thought she would pound to pieces.

In 1893 he took the cutter Navahoe across the ocean, but did not stay the season with that yacht, which was practically a failure. In 1895 he had his next experience in cup racing. He sailed the Vigilant for George J. Gould in the trial races with the Defender. In 1896 Barr had charge of the schooner Colonia, and then followed the Columbia for two seasons, and Reliance. In 1904 he took the Ingomar across the ocean and raced her there for Morton F. Plant. The next year he had command of the Atlantic in the race across the ocean for the Kaiser's cup, crossing the ocean in 11 days, 16 hours, 22 minutes. He sailed the 70-footer Mineola and last summer finished his glorious record with the Westward, which won every race except one, and that was a handicap.

Many yachtsmen are of opinion that it was Barr who kept the cup here when Shamrock II. came after it. He had charge of Columbia that year and Columbia outsailed Constitution in the trial races. She went to the line in the cup races in the pink of condition and Captain Barr knew every mood of that yacht. The races were all close, but Barr's cleverness and skill were worth minutes to the Columbia. In the first race Shamrock was first at the weather mark, but Barr nursed Columbia home and she won by a few seconds. In the last race of the series Shamrock had a lead of some minutes when Barr stood away from the challenging yacht and held over toward the New Jersey shore in the hope of getting a better slant there. He found what he wanted and was able to finish so close to the Shamrock that Columbia won the race on corrected time. He afterward said that had Shamrock won that race she would probable have won others and the cup, as Columbia's sails had all blown out and were useless for such racing.

Barr was only five feet five inches tall. He had black hair and black mustache and black eyes that saw everything. When racing a big yacht he had a habit of talking to himself while at the wheel. He would roll his wheel over and keep his eyes alternately on his head sails and his opponent. Those on board while the yacht was turning to windward would be lying down at the weather rail and the little skipper would talk in this way:

"Wonder what he's going to do now? What's he sanding off there for? Don't he know better? He'd better come about."

Then as if asking for advice he might say: "Shall I tack now or hold on?" Some one on board might venture an opinion on this if he did not know Barr, but it made no difference with the skipper. He had his campaign all planned and worked it out to his own liking and generally to success.

He was not always popular with skippers of other yachts because when he had worked his own vessel into a winning position he never let up, but made the victory as complete as possible. He was popular though with his men because he would never ask a man to do what he would not do himself and he never declined responsibility or allowed others to take blame for what he had ordered.

Once when the Reliance was rounding up to her mooring she was caught in the tide and the tip of her bowsprit struck the end of Constitution's boom and smashed it. A quartermaster was at the wheel and he came in for a storm of abuse from the managing owner. The man was told he could leave the ship. Barr quietly remarked, "If any leaves the ship, I will. I caused the accident." He didn't leave.

An example of his nerve and daring is shown in the race across the ocean, when he sailed the Atlantic. The weather on May 25 had been hard. The yacht was driving before a westerly gale under a square sail. It was getting toward night and things looked bad. Many on board were nervous. The seas were running high and the yacht was working. Captain Barr called Wilson Marshall, the owner, and asked his advice, telling him that he owned the yacht. Mr. Marshall listened to Captain Barr and was shown how the storm was affecting the yacht, and Captain Barr told him to remember too, that they were racing. He asked whether they would drive on, hoping the weather would moderate, or take in the sail and lay to. Some were for taking in the sail, but it was finally left to Captain Barr's judgment and he drove on. The weather moderated at midnight. Had he taken in sail the Atlantic would have been beaten, as the Valhalla was only twelve miles astern and driving along under topsails in weather to her liking.

One season Captain Barr handled the 70-foot sloop Mineola, and racing against him was the Yankee, sailed by Harry L. Maxwell. In a steady breeze on the Sound without any flukes Yankee won. The race was a hot one from start to finish. After the yachts had reached their moorings Barr went ashore and was asked how Mineola came to be beaten. "Why," replied the canny Scot, "Maxwell simply outsailed me. That was all." He never made excuses for defeats.

The schooner Ingomar was built by Herreshoff in 1904 for Morton F. Plant and Captain Barr was given charge of the yacht. She crossed the ocean in fast time, fitted out on the other side and then went through the campaign winning prizes in German and British waters. At Kiel Ingomar raced against the Emperor's yacht Meteor and as is usual a member of the home club was put on board Ingomar, the visiting yacht, because Mr. Plant was not a member of the club.

Ingomar and Meteor were maneuvering for position at the start on one big race. A quartermaster had the wheel on Ingomar, Captain Barr standing near and directing things. The Kaiser had the wheel on his own yacht Meteor. The Ingomar was on the starboard tack, standing for the line and had right of way. The Meteor was on the port tack and under the rules had to keep clear. The two yachts were drawing together on opposite tacks and the German representative, taking in the situation, turned to Captain Barr and said:

"Captain, the Kaiser."

Barr looked at the Meteor, looked again at his own yacht and made no reply. The two yachts drew nearer and the German got excited. "Captain," he said, "captain, the Kaiser, tack."

Barr then realized what he meant, and turning quickly to the visitor he said: "The Kaiser ceases to be the Kaiser when he steps on board a racing yacht." Turning to the quartermaster, he said: "Hold your course." The next minute the two yachts came together, but fortunately no damage was done.

That evening the Kaiser sent for Captain Barr. He talked yacht sailing with him, and when the captain left gave him a souvenir. The next day the Emperor kept the Meteor far away from the Ingomar.

Captain Barr always took as good care of himself as he did of his boat and never lost a race through not being in proper condition physically. This was never better instanced than in the first race between the Reliance and Shamrock III. in 1903. The first leg of the course was to windward and for nearly an hour and a half it was a mighty battle between these two boats, so that supporters of the Reliance began to the think that the Shamrock, a much smaller boat, was going to win. Even on the Reliance there was much worrying being done. The Shamrock had the weather position and she held it in spite of all Captain Barr could do with the Reliance. The two yachts would split tacks for a short period, but when they came together again Shamrock still held her advan-

tage. It is a severe strain on a skipper in a race of this kind. Wringe was the skipper of the Shamrock and finally after 90 minutes of close, hard work Barr succeeded in getting the Reliance clear of Shamrock, and after that she increased her lead every minute. Wringe while in this country had been dined and feted and he was not in condition for such a hard race. The strain told on him and Barr was better able to stand it.

His skill as a navigator was wonderful. No matter how thick a fog might shut down Barr could always find his way to the marks and home and he was so accurate that his skill became almost proverbial. Once when sailing the Columbia off Newport a thick fog shut down and screened everything. Some skippers quit the race and made for home. A steamer with the reporters on board was close to the Columbia and the skipper remarked, "If you wish to keep on I am going to stay by the Columbia." He did. Columbia picked up the second mark just as if it had been in Barr's eye all the time and then heading for home made the finish line as accurately as if the whole course had been in view. This skill was again demonstrated in the last race sailed by Reliance and Shamrock III. The fog closed down at the outer mark. Vessels could be heard all round. Their skippers felt their way back to the lightship. The Shamrock missed the line and could not finish. Those who had gathered at the finish suddenly heard a flapping like the sound of some big yacht's sail. The next instant a ghostlike form was seen rising out of the fog and then Reliance sailing fast, for there was a nice breeze, crossed the line a winner and was saluted. She had sailed a perfect course and Barr had in spite of tide and wind brought her home to the finish accurately.

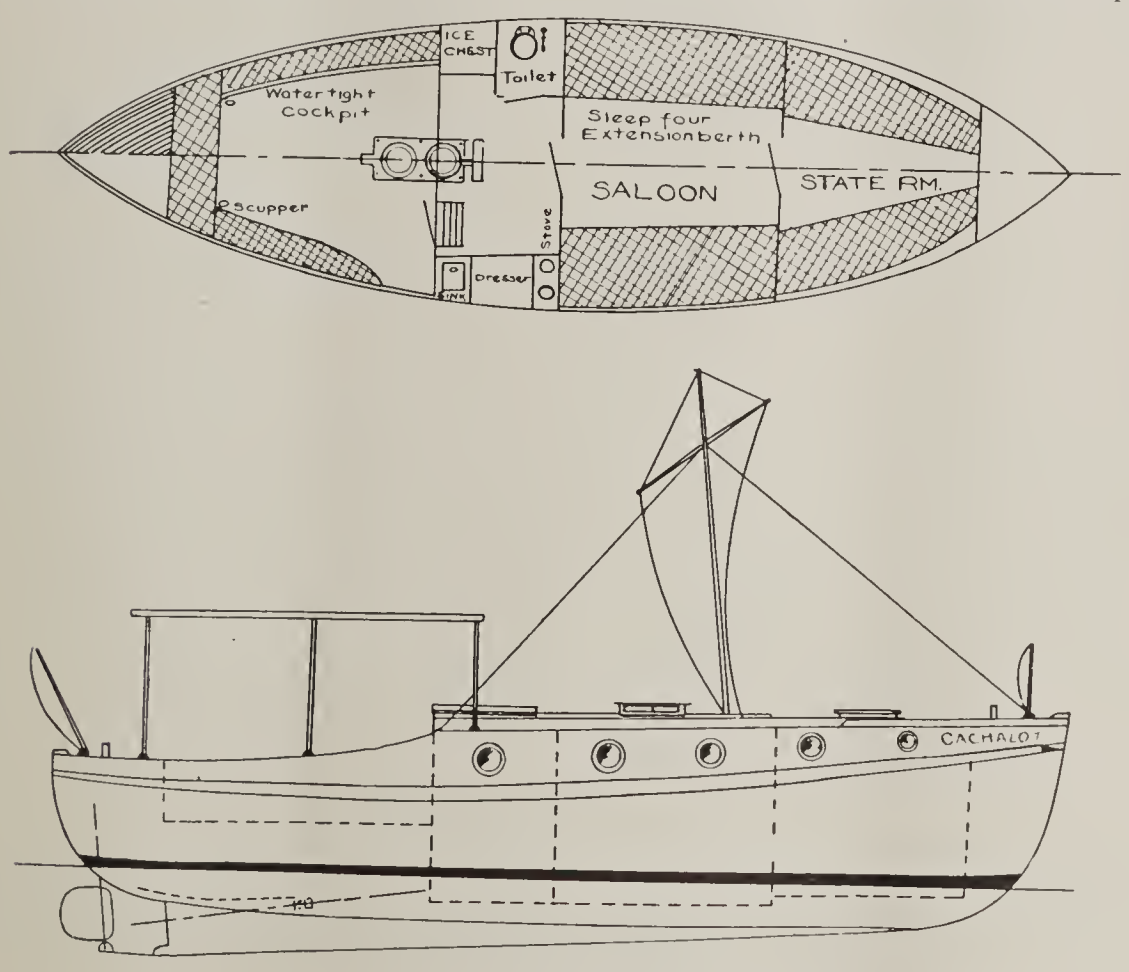
Motor Boating.

Whaleboat Cruiser Cachalot.

THEODORE K. HASTINGS, a member of the Sheepshead Bay Y. C., who last year had a motor dory in which he did some long cruising, is this year having a whale boat cruiser built by the J. M. Casey Company, of New Bedford. The model shows a boat of good, wholesome type and with fair accommodation. The dimensions are length over-all, 30 feet; extreme beam, 9 feet. There is three feet of deck aft, a cockpit 8 feet long, a cabin 19 feet long with head room 5 feet 9 inches to 6 feet. This cabin is divided into a stateroom at the forward end which has two transom berths, a cabin with berth to sleep for four, a toilet and a galley. The saloon and cabin will have locker under the transoms on the port side and a bath on the starboard side under the transoms. The interior finish will be mahogany and white enamel and leaded glass doors will separate the engine room and galley from the cabin. The galley will have an alcohol stove, dish locker and dresser and the usual fittings.

The boat is to be staunchly constructed. The keel is of native oak, sided 4 inches and started from 6 inches deep forward increasing in depth clear to the stern. The timbers are of oak 1½ by 1½ inches and spaced 10 inches on centers. The planking is ⅞ inch white cedar. The floor timbers along each side of frame are 1 1/3 inches selected oak. The stem and stern are of selected oak moulded. The raised deck and combing are of mahogany.

This yacht, which is to be named Cachalot, will be driven by a 14 horsepower jump spark heavy duty Stanley motor, fitted with Stanley reverse gear and Thermax silencer. All controls are to be at the wheel.



PLANS OF T. K. HASTINGS' WHALEBOAT CACHALOT.

Rules for Bermuda Race.

THE members of the Motor Boat Club of America have great hopes that the next race to Bermuda, which will be started June 17, will be the most successful in the history of that event. Thomas Fleming Day thinks there will be at least six starters, and James Craig says that two new boats he knows of will take part in the contest.

The regatta committee will shortly issue the conditions to govern this race and announce the prize list, which is a liberal one.

The sub committee appointed to consider changes in the rules governing the motor boat race from this port to Bermuda has gone thoroughly into the questions raised and has made its report. This report, which is signed by Henry R. Sutphen and James Craig, says:

"The racing rules, time allowances, endurance tables, etc., which include the revised horsepower

Canoe Handling and Sailing.
The Canoe: History, Uses, Limitations and Varieties, Practical Management and Care, and Relative Facts. By C. Bowyer Vaux ("Dot"). Illustrated. Cloth, 163 pages. Price, $1.00. New and revised edition, with additional matter.
A complete manual for the management of the canoe. Everything is made intelligible to the veriest novice, and Mr. Vaux proves himself one of those successful instructors who communicate their own enthusiasm to their pupils.
FOREST AND STREAM PUBLISHING CO.

My Friend The Partridge.
S. T. Hammond. A delightful reminder of crisp autumnal days in the covers. It tells of sport with the noblest of game birds, the habits and habitat of the ruffed grouse, with just the right touch of reminiscence and personal experience. Cloth. Illustrated, 150 pages. Postpaid, $1.00.
FOREST AND STREAM PUBLISHING CO.

FOREST AND STREAM
A JOURNAL OF OUTDOOR LIFE
TRAVEL, NATURE STUDY, SHOOTING, FISHING, YACHTING.

CORRESPONDENCE.
The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. The editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.
Subscriptions may begin at any time. Terms: For single copies, $3.00 per year; $1.50 for six months. Rates for clubs of annual subscribers:
Three Copies, $7.50. Five Copies, $12.
Remit by express money-order, registered letter, money-order or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canada and Great Britain. Canadian subscriptions, $4.00 a year, $2.00 for six months.
Foreign Subscriptions and Sales Agents—London: Davies & Co., 1 Finch Lane; Sampson, Low & Co. Paris: Brentano's. Foreign terms: $4.50 per year; $2.25 for six months.

ADVERTISEMENTS.
Inside pages, 16 cents per agate line. Special rates for three, six and twelve months. Eight words to the line, fourteen lines to one inch. Advertisements should be received by Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money, or they will not be inserted. Reading notices, seventy-five cents per line. Only advertisements of an approved character inserted.

Display Classified Advertising.
Hotels, Summer and Winter Resorts, Instruction, Schools, Colleges, etc. Railroad and Steamship Time Tables. Real Estate For Sale and To Let. Seeds and Shrubs, Taxidermists. The Kennel. Dogs, etc. Wants and Exchanges. Per agate line, per insertion, 13 cents. Three months and over, 10 cents per line.

Solid Classified Advertising.
For Sale. Kennel. Property For Sale. Real Estate For Sale or To Let. Wants and Exchanges. Per agate line, 10 cents. Absolutely no display. No advertisement of less than three lines accepted. Cash must in every case accompany order.

FOREST AND STREAM PUB. CO.
127 Franklin St., New York.

rating as adopted by the American Power Boat Association for 1911, are to be followed with the exceptions as noted below:

"The midship section of a vessel to be expressed in square feet and obtained as follows: With the boat in the same trim as when measured for load waterline length, divide the load waterline length into five equal parts or stations. At each of these points obtain the area of the section in the following manner:

'Divide the beam (B) into five equal parts or stations, and at the first inboard station from either end measure the perpendicular from the water surface down to the under side of the boat's planking (C). Then C and D multiplied will give the area of the section.

"Integrate the areas thus obtained by Simpson's rule obtaining the volume of displacement (in cubic feet). This result multiplied by 64 for salt water will give the displacement of the boat in pounds. Then the (arbitrary) midship section shall be ascertained by multiplying the displacement in pounds by a constant, and dividing the product by the load waterline length in feet. The constant for salt water shall be .0284."

Boston Motor Boat Show.

The annual exhibition of motor boats, marine engines and accessories was opened in Boston last Saturday, and in a measure it gave some idea of what might be seen in the annual exhibition which will open here in the Madison Square Garden on Feb. 21.

It is the fourth annual exhibition that has been held in Boston, and it has grown wonderfully in popularity in that time. This indicates, too, how popular the motor boat has become with those who are fond of living on the water as much as possible during the summer. The marine engine and the motor boat has, however, outgrown the stage where it is used only for pleasure, and now both are used for commercial purposes and are fast driving the old-time sailing craft and the small steamer out of existence.

From a general inspection of the Boston show it appears to be the largest and most complete collection of power boats, engines and all the thousand and one component exhibition of power craft ever gathered together in one building.

In 1908, the first year of the independent power boat show, that is, the first time it was divorced from the automobile show, there was a total of 101 separate exhibitors. In 1909 this was increased to nearly 180, last year it was 220, but this show has a number in excess of that figure, judging from the official program. This shows best how great has been the increase in engine and power boat manufacturing in the last three or four years. Again as in the last three years the space given over to the exhibitions is the north hall, balconies and basement.

The engine exhibit shows a greater variety of types and designs than ever before. Accessories as usual is correspondingly large; in fact, everything that helps to make an engine "mote" is on display. Both evidence of the growth of the trade, while scrutiny of the goods gives ample evidence of the great strides being made toward perfection of the combustion engine.

The Western boat manufacturers, who take large space, showing stock designs—that is, one boat or a number of different types of boats, from the molds of which any number of craft can be constructed at a moderate price—pay a high compliment to the New England market. This is a line of the trade the local manufacturers and yards, with the exception of one or two concerns, have not taken up, preferring to have a separate design for each boat built.

As to the cost of power boats, there are boats shown this year that will fit almost every pocket book. This sport is not for the wealthy sportsman alone, but is largely taken up by men and women of moderate means who find that they can enjoy power boating quite as much as the wealthy, though on a much more moderate scale.

Thus the trend in the last few years has been toward popular prices, and a great number of the exhibits show this class of boat. Thus any man who has $75 or more to spare for a power boat can enjoy the sport to his heart's content.

Development of the Marine Gas Engine.

Coincident with the development and perfection of the automobile for commercial service, the same strides have been made in the adaptation of the marine gas engine to a similar service on almost all of the principal waterways of this country as well as many of the South American and European countries and in the far East.

Whereas only a few years ago the marine gas engine was considered largely as a toy to be used by the wealthier class of pleasure seekers, it has developed to such an extent that it is now a "money maker" instead of a "money spender" for a very large class of people both in poor and moderate circumstances, who depend upon the sea for their living, engaged in various occupations such as fishing, freighting, passenger service, towing and the like.

On a trip through Europe and various other foreign countries the tourist is surprised to note the extent to which the American-made marine gas engine has been put for commercial service. On the canals of Holland, Belgium, Germany and France are seen hundreds of canal boats propelled by heavy duty American-made motors, where a few years ago a very familiar sight to be seen at these same points was a combination team of a woman, a horse, and a dog as a slow and decidedly inhumane means of propelling the heavy canal boats.

In the harbor of the ancient town of Mounichia, Greece, near Piræus, seaport of Athens, and lying in the shadow of Mt. Hymettus, famous for its honey, the traveler may see launches and vessels of various kinds and of no mean proportions equipped with American-made internal combustion engines.

In Denmark, American motors are found in use in various types of boats employed in the Government service—notwithstanding legislation favoring home products—such as revenue cutters, pilot boats, custom house boats, and in harbor service as well as in private passenger and freight boats.

They are used not only for trips of short distances, but in making long continuous runs, where absolute dependence upon the power installed is of paramount importance. It is a thing of regular practice to use such a motor for making the run between Rangoon, India and the Nicobar Islands, which is a distance of a thousand miles, mostly in the open sea.

Coming nearer home, to Central and South America, the tourist opens his eyes in wonder at the large numbers of American motors installed in heavy duty boats and lighters plying between the steamers in the outlying harbors and the banana plantations located up the rivers.

One might question the reason for this continual and increasing supplanting of the steamboat, once monarch of the seas, by the gas engine boat. The reason is not far sought—economy. Economy in the use of fuel and in the amount of labor necessary to be employed. In a steam engine it is necessary to fire up some five to six hours before the start is made, which means a consumption of fuel while the boat is lying positively idle. In the gas engine the fuel is turned on at the moment of starting, and all fuel consumption is positively cut off at the moment of stopping and on laying up for the night. With a steam engine it is necessary to carry a licensed crew; with a gas engine two men and a boy, with ordinary intelligence, can handle a good-sized boat successfully.

A few years ago gasolene was the only fuel used in this type of engine. To-day they have been so perfected and developed that some of the American-made motors will use without diffifulty, developing their full power, gasolene, kerosene, alcohol and even some of the very crude oils particularly such as are found on the Pacific coast to be bought at a price of five or six cents per gallon.

In very recent years some considerable success has been obtained with producer gas in connection with the marine gas engine; in fact, some of the American-made motors will use this fuel with the same degree of satisfaction as with any of the other mentioned fuels. On the canals of Belgium there are a number of hulls in sizes up to 1,400 tons dead weight equipped with producer gas engines, operating with perfect satisfaction.

Work at Luder's Yard.

Port Chester is the scene of considerable activity at this time in the motor boat line. The Luders Marine Construction Company of that place is rushing work on a number of boats for extreme early spring delivery. The 60-footer Kathmar II. is now planked and having the joiner work installed. This craft is being built for Robert T. Fowler, of the New Rochelle Y. C. The boat is powered with a 6-cylinder 20th Century engine that will drive the boat about thirteen miles per hour, and the gasolene capacity is sufficient for a continuous run of not less than 500 miles.

Ample accommodation is provided for four or five persons in addition to a crew of two. The crew, engine and gasolene are entirely isolated from the owners' quarters. All conveniences possible will be installed, such as bath tub, electric lights, call bells, etc.

The 45-foot 21-mile shelter cabin boat recently designed and built for Schuyler Schieffelin, of New York, by this firm, powered with a 100 horsepower Jencick motor, is being overhauled and a few alterations made.

Alterations have been completed on Augustus G. Chesebrough's Wistaria, greatly increasing the comforts of the boat.

Albert Chesebrough, of Northport, has just placed an order for a 32-foot 30-mile runabout to be equipped with a 100 horsepower Sterling motor.

The 106-footer building for John H. Flagler is now being pushed to secure an early completion. This boat with a clipper bow and counter stern, with two funnels, schooner rigged, with a speed of sixteen miles, with a 300 horsepower Standard engine, will present quite a unique appearance among gasolene craft.

Two 36-foot raised deck cruisers are now near the the finishing touches preparatory to launching as soon as the river is clear of ice.

Canoeing.

A. C. A. Membership.

NEW MEMBERS PROPOSED.

Atlantic Division.—Douglass Cummings, 73 South Clinton street, East Orange, N. J., by George P. Douglass; George G. Richards, Sixth and Chestnut streets, Philadelphia, Pa., by Frank T. Wilson; Daniel J. Finn, 2174 Amsterdam avenue, New York City, Henry R. Berning, Jr., Marble Hill, Kingsbridge, New York City, Alexander Wright, Jr., 3404 Barker avenue Williamsbridge, New York City, and Peter H. Morgan, 1263 Washington avenue, New York City, all by Fred W. Baldwin; William A. Rogers, 1317 H street, Washington, D. C., by Henry D. James; Charles R. Swart, 2026 Ruscomb street, Germantown, Philadelphia, Pa., Albert E. Svenson, 2637 West Lehigh avenue, Philadelphia, Pa., Edward S. Duffey, 4619 Germantown avenue, Philadelphia, Pa., Victor D. Abel, 608 North 13th street, Philadelphia, Pa., and H. Le Roy Walker, 1704 Tioga street, Philadelphia, Pa., all by E. R. Coleman.

Central Division.—W. Edward Davis, 5635 Rippey street, Pittsburg, Pa., and F. H. La Baume, 922 Commerce street, Roanoke, Va., both by H. D. James.

IMPORTANT ANNOUNCEMENT

The REMINGTON ARMS COMPANY and The UNION METALLIC CARTRIDGE COMPANY, heretofore allied in fact but not in name, will hereafter be known directly to the public as

REMINGTON ARMS - UNION METALLIC CARTRIDGE CO.

and all dealings will be conducted under this new title.

The main office will be at **299 Broadway, New York City.**

The famous trade marks

Remington UMC

will be combined into one, and hereafter represented by this device

REMINGTON UMC

The purpose of these important changes is that the associated interests of REMINGTON-UMC may be more directly represented to the trade and the shooting fraternity in all the progressive plans and activities outlined for the future.

Remington-UMC — the perfect shooting combination.

REMINGTON ARMS-UNION METALLIC CARTRIDGE CO. :-: 299 Broadway, New York City

Trapshooting.

July 9-10.—Fargo, N. D.—Gate City G. C.—Albert E. Rose, Sec'y.
July 18-20.—Wilmington, Del.—The Interstate Association's sixth Eastern Handicap tournament, under the auspices of the Du Pont Gun Club; $1,000 added money. Elmer E. Shaner, Sec'y-Treas., Pittsburg, Pa.
July 26-27.—Butler (Pa.) R. and G. C. Geo. J. Elliott, Sec'y.
Aug. 16-17.—Pawnee, Okla.— Big Four League's tournament. Dave Elliott, Sec'y.
Oct. 25-26.—Kansas City, Mo.—Big Four League's tournament. Dave Elliott, Sec'y.
Sept. 4-5.—Lynchburg, Va.—Virginia State tournament, under the auspices of the Lynchburg G. C. J. D. Owen, Sec'y.

DRIVERS AND TWISTERS.

Thirty-nine shooters took part in the shoot of the Hudson Gun Club, Jersey City, on the first day of last week. D. D. Engle was high for the day with 86 per cent. The team contest, Clarendon Gun Club vs. Hudson Gun Club, was won by the Clarendons, 130 to 118. Each club is now one and one. The deciding match will be shot on the Clarendon grounds at an early date. The third shoot of the prize series will be shot on Feb. 12.

Clarence G. Stone, Secretary, informs us that at a meeting, held Jan. 26, of the gun section of the Siwanoy Country Club, Mt. Vernon, N. Y., the following officers for the section were named: Chairman, C. W. Schedler; Secretary, Clarence G. Stone; Captain, W. Thorpe; Vice-Captain, Geo. A. Wylie; Supplies, Harry V. Morgan; Handicap, G. A. Wylie, C. G. Stone and E. W. Valentine; Trophies, C. W. Schedler, John Wintjen, Gus. Kolb; Executive Committee: C. W. Schedler, C. G. Stone, W. Thorpe, H. V. Morgan and E. W. Valentine.

The country place of the Crescent Athletic Club, at Bay Ridge, Brooklyn, may have a change of ownership, if the club members decide to purchase a fine piece of land on Hempstead Harbor, near Sea Cliff, L. I. The Bay Ridge property is assessed at $390,000. It was said that the money that could be obtained from the sale of this land would easily finance the proposed new athletic field, which would give the club a much larger area for sports than it now enjoys in the Bay Ridge property. The Sea Cliff property contains 100 acres, and is on the water front. Here the club would have a fine opportunity for yachting and water sports.

Secretary-Treasurer Elmer E. Shaner writes as follows:

PITTSBURG, Pa.—Please announce to the readers of FOREST AND STREAM that the Twelfth Grand American Handicap tournament, that of 1911, will be held at Columbus, O., June 20, 21, 22 and 23, on the grounds of the Columbus Gun Club. There will be $1,500 added money, and the winner of first place in the Grand American Handicap proper will be guaranteed $1000 in cash in addition to a handsome trophy.

The Columbus Gun Club was the lowest bidder for conducting the G. A. H. tournament this year, its bid

being $5.75 for each 1000 targets trapped, as shown by the official score sheets of the tournament. At the figure named, the Columbus Gun Club will furnish traps, targets, referees, scorers, squad hustlers, trappers and trap-pullers.

Secretary-Treasurer Elmer E. Shaner, Pittsburg, Pa., writes us as follows: "We have received several inquiries as to whether gun clubs holding registered tournaments under our new policy were privileged to schedule other events in connection with the regular program furnished by us. For the benefit of all concerned, we would state that gun clubs and State associations holding registered tournaments may schedule, in connection with the regular program furnished by us, any and all events they want, such as championship events, handicap events, double target events and extra events of any nature. They may also apply part or all of their own added money, if any is contributed, to said events, charge two cents for each target trapped and retain all of the proceeds. In other words, the Interstate Association's contribution and the Squier money back system applies only to the ten 15-target events of the regular program furnished by us."

BERNARD WATERS.

Hell Gate Gun Club.

NEW YORK, Jan. 28.—The eighteenth year of this active live-bird organization was inaugurated by the first contest on Jan. 25, at their usual shooting grounds. Instead of shooting three monthly contests, each member now shoots at an aggregate of 30 birds, and the handicapping, both distance and point system, is figured in excess number of points made, the possible being 9 points, the member with a handicap of 21 must score 30 straight to obtain the maximum. Mr. Jos. Selg, at the minimum of 12, scored 21, which gave him the highest total of 9 points, thus winning the first prize for the day. The weather was delightfully mild and clear, some wind when the first-named five members shot their allotment, clouding up in the afternoon and becoming misty and dusk, denoting the approach of a storm.

The birds were as fine a lot as ever were trapped, and the scores showed rather mediocre ability on the part of all the entries, though it must be noted that each man shot one yard back of his handicap, as the distance marks were so obliterated by the weather. The first squad shooting behind the mark, it was decided to continue it to the end to make it fair for everybody.

The evening before, when the pioneer contingent arrived, they repaired immediately to Lucky Straub's sportsmen's resort, where a menu of Chesapeake oysters, beans, Lehigh county sausages, ham and eggs, oyster pie and stews, steaks and mineral waters were severed with great eclat.

On arrival at the Duck Farm Hotel the rest of the evening was spent in studying astronomy and pinochle, for it was a beautiful, clear night.

Charley Lange ran out poorly on the club score, but his fifth, a double-back-action twisting-driver, was stopped with a well judged and long first barrel, and his 6th, a long second, was commendable.

Bandy's 3d and 14th, and Schorty's 3d, 5th, 6th and 15th were fast.

Jos. Selg's 8th and 14th, Voss' 1st, 9th and 24th—particularly the latter—were beautiful stops.

Dannefelser's 10th, 11th and 29th, Pete Garm's 11th, 19th, 21st and 28th, Wellbrock's 2d, 10th, 12th, 16th and 19th; John Hughes' 8th, 14th, 15th and 27th were clever kills, and some of them at long distances, as John shoots slow.

Phil Woelfel shot exceedingly well for the first attempt in three years; his 2d, 12th, 14th, 23d and 26th were good ones.

John Klenk also appeared, the first time in a year, and he certainly made a record on drawing good birds, having no less than 6 hurricane drivers well negotiated and 2 marked with an asterisk.

The three best kills for the day were Lange's 6th, Voss' 23d and Woelfel's 14th.

Capt. Binnacle Scheubel, of the king-fishing motor smack Ha Ha, was official bushwhacker; and he certainly stopped a number outside the boundary and augmented the potpie.

Our guest, Mr. A. T. Meckel, made his first attempt at the birds and occasioned considerable excitement and fun among the members.

Big apples, etc., were wagered galore on the result of each bird, and when he scored, a whoop went up from the winners that nearly stopped the town clock.

Schorty's score created much hilarity in the extra event, particularly when he dropped 4 in a row, and he was advised to "sell your gun," "getting old," "get good shooting glasses," "back number" (which he acknowledged), John Wellbrock handing him a few of Dannefelser's good shells to improve his score, etc.

Messrs. Garms, Wellbrock and Klenk were high in this event, with 12 scored.

The average scored to-day of the 545 shot at was low owing to the excellent quality of the birds supplied by Landlord Schaffer, and the extra yard handicap, only 379 being scored, an average of less than 70 per cent.

Our next shoot takes place in March.

A. T. Meckel (guest) shot at 5 and scored 2.

MANHATTA.

The Fred Macaulay Business Men's Gun Club.

NEWARK, N. J., Jan. 28.—More than three hundred gunners and their admirers and lovers of the trapshooting sport were on hand at the traps of the Fred W. Macaulay Business Men's Gun Club, at the Speedway yesterday afternoon to see the match between Frank Mihlon and Henry C. Koegel. The latter came out victor in the 100 bird handicap event by defeating Mihlon by an actual score of 91 to 75. The latter, however, had an 8 bird handicap, and the final score read: Koegel 91, Mihlon 83. Although the day was not an ideal one for trapshooting, thirty-six gunners faced the traps and turned in some good scores.

The match was shot in strings of 25 birds, and the first quarter of the match was shot in the tenth squad that faced the firing line for the day, while the rest of the match was shot in the eleventh, thirteenth and fourteenth squads. In the first part of the match Koegel killed 22 birds out of 25, while Mihlon killed all but 6. In the second string, Koegel increased his lead by smashing 23, which was 3 more disks than his rival succeeded in breaking. Mihlon smashed 22 bluerocks in the third string, but Koegel went him one better, while in the last 25 the captain of the club missed eleven times, while Koegel hit all but two of the saucers thrown from the traps. Besides winning the match, Koegel tied with Firm Bissett for high individual average, while Phil Coffin was third high man of the day. Neaf Apgar was high gun among the professionals, smashing 95 out of a possible 100 birds.

The local gunners will go to South River on Thursday, Feb. 2, to shoot an eight-man match against the South River Gun Club. The match calls for each man to shoot at 100 birds. The local marksmen will make the trip in automobiles. The scores follow:

Fred Macaulay	21	..	..	..	..	..	..	..
James J Quinn	15	13	16	..	..	..	..	..

*14 out of 15, first trial.

In the match between James E. Wheaton and Peter Bey, Wheaton was to shoot at 100 targets and Bey at 50, Wheaton allowing Bey 50 dead birds to start with. The outcome was that Bey was the victor by 10 birds. The scores out of each 25 were as follows:

Wheaton	18	19	19	17—73
Bey	25	25	17	16—83

President Fred Macaulay, the standard-bearer of the club, while at the traps with several other members the following morning after the shoot was surprised at the appearance of a beautiful full-grown deer, coming on a full run down Speedway avenue toward the gun club; its tongue was hanging out of the side of its mouth and its tail was whipping up and down at every jump. It looked frightened to death as it saw us. It stopped and jumped the 6ft. sword-pointed fence of the Speedway, crossed just south of the judges' stand and bounded the fence on the other side with apparently as much ease as a boy would throw a stone over a house. It rested a few moments in the brush, while people who saw it ran for ropes and other things to try and capture it with, when along came a dozen boys, following the track in the snow, and they had with them setters, pointers, fox-terriers and muts of all kinds. They started the deer again, and he went over fences, through back yards and up through the fields toward the Orange Mountains. A man on a wagon for the Public Service Company said that he had seen four different deer in the neighborhood of South Orange that morning. It was afterward reported that there was a reservation in the Orange Mountains, where 104 deer had been kept and that a number broke out, and that is where this one came from and seemed to be heading back that way.

Hudson Gun Club.

JERSEY CITY, N. J., Jan. 29.—There were thirty-nine shooters who took part in to-day's program events at the Hudson Gun Club regular bi-monthly club shoot, and they kept banging away at the bluerocks until the rain put a stop to the game. The only straight score to-day was made by Billy O'Brien, who also shared high gun honors, with D. D. Engle with 86 per cent. and won the trophy that our baker friend, L. Gille so generously donated at our club shoots.

Jim Leary and Harry Burlington had it out at the traps this morning, to decide which was the best shot. Leary had 6 birds the best of it on the 43d round, and Burlington withdrew from the race, vowing vengeance on a certain trade representative, who had taken his sausage machine in mistake for his own at a shoot that they both attended the day previous. There was also a team race between three members of the Clarendon Gun Club and three members of the Hudson Gun Club. The Secausus boys were the victors by 12 birds, and as each club has a victory won, this being the second match shot between them, it was decided to shoot the deciding race at the Clarendon grounds in Secaucus, N. J., at an early date.

Young Thoben and young Williams started in the game to-day, and made a good impression on some of the older shooters, as to their abilities to become "target busters." Their daddies, who were watching them perform, had better practice up a bit or the kids will in a very short time be able to put it all over them in a shooting match.

The third shoot of our prize series will take place on Feb. 12. This will be the last chance to enter, to shoot four scores, as we will not allow shooting up any past scores in the prize events.

We start to shoot at 9:30 A. M. every other Sunday morning, and to reach the grounds take the Turnpike car from the P. R. R. Ferry to the west side of Hackensack River Bridge and walk north along the river bank to the club house, where the Stars and Stripes will be flying to welcome any man that can use a scatter gun.

Don't forget the date, Feb. 12. Hot lunch served gratis.

Northern Kentucky Gun Club.

DAYTON, Ky.—An impromptu live bird shoot was held on Jan. 19, five members participating. The birds were an average lot, and furnished good sport. The weather conditions were not ideal. John Schreck was high man, missing but one bird. Irwin was allowed a handicap of 4, which put him in second place with Gould and Payne.

Twenty-five live birds, 28yds., extra bird handicap; $7 entrance, trophy to winner:

Schreck	0 24	Irwin	4 23
Gould	0 23	Walker	0 22
Payne	0 23		

The Little Miami Gun Club was organized in the East End, Cincinnati, O., this month, with a membership of fifty. The officers are: L. Watkins, President; W. Roeder, Vice-President; G. Langsdorf, Treasurer; H. Johnson, Secretary; A. Kramer, Field Captain. Committee on Grounds, Messrs. Meyer, Kramer and Westerman. For the present the club headquarters will be at the Little Miami House, on the Interurban Traction Line. The club shoots on Sunday afternoons, and will begin as soon as the weather is suitable.

DAYTON, Ky.—Arrangements had been made for a big crowd at the grounds on Jan. 22, but the interference of the Weather Clerk kept all but four of the greatest enthusiasts from putting in an appearance. The day was cloudy and cold, and the ground was covered with snow and slush, making outdoor sport anything but a real pleasure. Holaday, Jr., was high man with 80 out of 100 targets. Schreck and Holaday, Sr., were shooting with borrowed guns, and in spite of this drawback they both broke a larger per cent. of their targets than either of the others, and beat them in a team race by a score of 86 to 73. Shooting at 25 pairs of doubles, Holaday, Jr., broke 43 and Payne scored 32.

The Kentucky State shoot at targets will be held under the auspices of the club on May 23 and 24, and this is to he under the Squier money-back system. A large attendance is expected. The Crystal Lake Gun Club will celebrate Washington's Birthday with a big live-bird shoot on their grounds at Ryland, Ky., for which programs will soon be out. The affairs of this club are always enjoyable, and an effort will be made to make the coming event a record-breaker.

Holaday, Jr.	80	Schreck	45
Payne	71	Holaday, Sr	41

Team match, 50 targets per man:

Holaday, Sr.	41	Payne	36
Schreck	45—86	Holaday, Jr	37—73

Three 10-bird events at live birds were shot on Jan. 26, five shooters taking part. The day was cloudy, with a stiff wind blowing. Birds were an average lot. John Schreck was high man for the afternoon, missing but 2 out of 30 birds shot at. In the first event he tied on 9 with Mason, and shot off the second event, winning by a score of 10 to 8, and capturing both trophies.

In the last event Gould and Walker tied on 9, and as the latter could not stay for a shoot-off, the trophy was not awarded.

Payne and Gould each shot at a pair of doubles, the former killing both his birds and the latter missing his.

Event No. 1, 10 birds, $3 entrance, trophy silver spoon:

Mason, 28	9	Walker, 31	8
Schreck, 32	9	Payne, 31	8
Gould, 31	8	Schreck, 33	10

Event No. 2, 10 birds, $3 entrance, trophy silver spoon:

Gould, 31	9	Mason, 29	8
Payne, 31	9	Walker, 31	6

Event No. 3, 10 birds, $3 entrance, trophy silver spoon:

Gould, 32	9	Payne, 32	8
Walker, 32	9	Schreck, 32	8

On Jan. 29 it rained heavily until the middle of the afternoon, and there was nothing doing in consequence. Payne is arranging for a live-bird event to be held on the Cincinnati Gun Club grounds on Feb. 16. It is up to the members to back him in his efforts to start something on the grounds once more, and there ought to be a good attendance.

Frontier Rod and Gun Club.

BUFFALO, N. Y., Jan. 22.—The weather was quite favorable at the shoot of the Frontier Gun Club to-day. The scores were not up to average. One of the new members tied with Eichberg on 23 in the handicap gun event. He also won in the shoot-off with 15. In the cup race, Kamman, Utz and E. Bidell won Class A, B and C points. In the match contest, Dewald's team defeated Eichberg's.

NEW WORLD'S RECORD MADE IN INTER-CLUB MATCHES

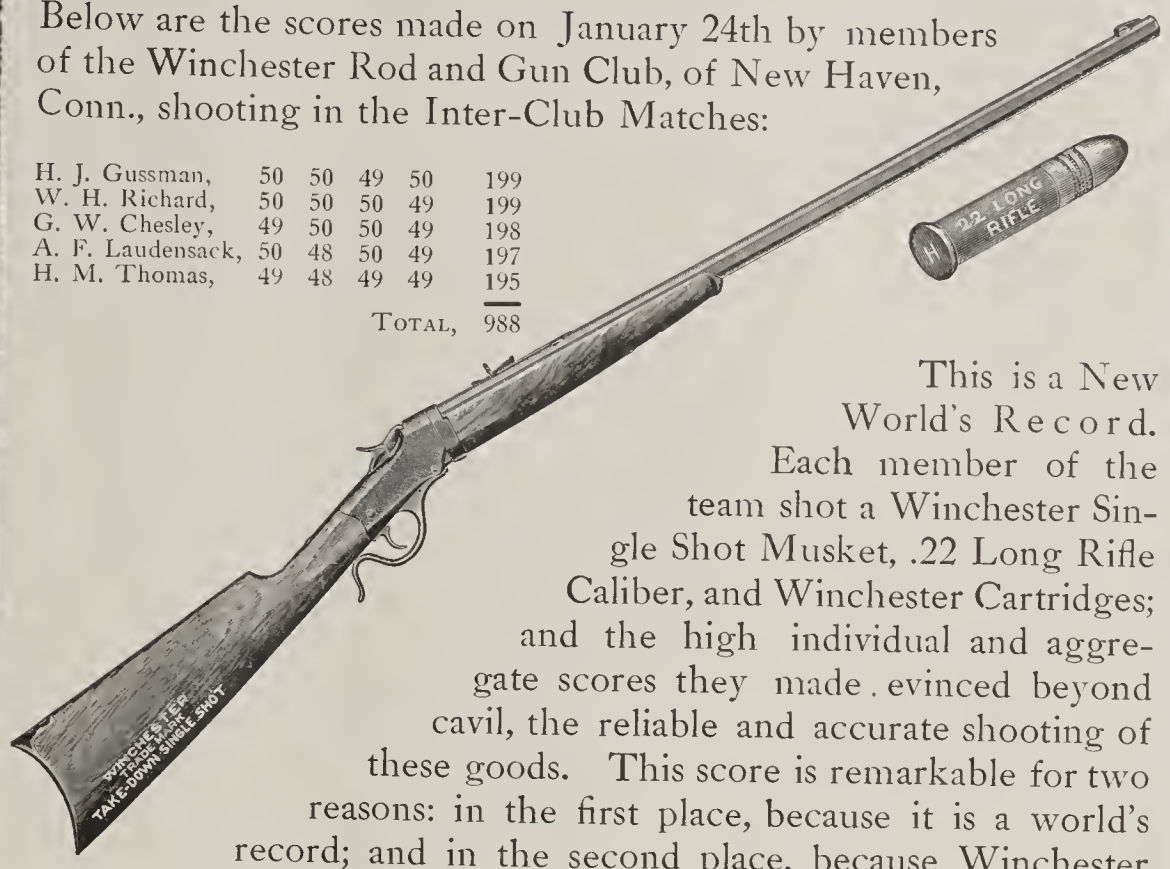
With

WINCHESTER

Rifles and Cartridges

Below are the scores made on January 24th by members of the Winchester Rod and Gun Club, of New Haven, Conn., shooting in the Inter-Club Matches:

H. J. Gussman,	50	50	49	50	199
W. H. Richard,	50	50	50	49	199
G. W. Chesley,	49	50	50	49	198
A. F. Laudensack,	50	48	50	49	197
H. M. Thomas,	49	48	49	49	195
				TOTAL,	988



This is a New World's Record. Each member of the team shot a Winchester Single Shot Musket, .22 Long Rifle Caliber, and Winchester Cartridges; and the high individual and aggregate scores they made evinced beyond cavil, the reliable and accurate shooting of these goods. This score is remarkable for two reasons: in the first place, because it is a world's record; and in the second place, because Winchester rifles and cartridges were used by every member contributing to it. However, this is not so remarkable, as Winchester goods have been for years the choice of the best shots.

FOR HIGH SCORES SHOOT WINCHESTER RIFLES AND CARTRIDGES

Manhasset Bay Y. C.

PORT WASHINGTON, L. I., Jan. 22.—Bright sunshine and a snow covered country greeted the gunners of the Manhasset Bay Yacht Club this morning. The glare of the sun made shooting difficult, but some good scores were made. Jack Fanning, the trade representative, paid us a visit and shot along.

Owing to the large number of entries for the championship shoot next Saturday two sets of traps will be used.

Ten-bird scratch, sweepstakes:

J W Alker	8	C M Gould	7
E Roesler	7	W Roesler	5

H Funke	10	E Roesler	6
C M Gould	8	H F Clark	4

*Professional.

Columbus Gun Club.

Columbus, O., Jan. 26.—There was a sure shooting match at the Columbus Gun Club Thursday, Jan. 26. Fifty-six shooters were in attendance, and forty-six shot in the program of 150 birds. Every one seemed to have a good time. E. M. Stout was high with 141. J. B. Cromley 140, Jones, Heikes and Squier 137; Fisher, Cooper and Spangler got fourth place with 136.

Circleville team won the team match by 2 birds, 423 to 421. Columbus goes to Circleville on Feb. 9. Then there will be another tale to tell, we hope.

There was a smile on every one's face when they heard that the Columbus Gun Club will get the Grand American Handicap, the one shoot of all shoots. The shooters of Ohio can make up their minds to attend this year's G. A. H., for it will be close to home. They can thank the Columbus Gun Club for getting this grand shoot, for they have sacrificed all the profits on targets to get it.

The next shoot of the Columbus Gun Club will be held Feb. 22-23, on the money-back system. There was no average money for the shoot of Jan. 26, as it failed to pay the losses by $125, the only time it has ever failed to pay out. The club paid all losses, and will do so at the next shoot. The club thanks one and all for their attendance and hopes to have you all with us many times this year.

The State shoot will be held on these grounds June 6, 7, 8, 9, 1911.

Eleven shooters were out to the traps on Saturday afternoon, Jan. 28. Most of the regulars got shot out at the regular monthly shoot, Jan. 26. Capt. Carson won a point on the Dupont trophy; he and Guy Smith tied with 43 out of 50; on the shoot-off the Captain won. Capt. Bunker was a welcome visitor and shot a few. He still knows how. Hope to have you often, Captain. Messrs. Holstein, Green and Day were also more than welcome. Don't forget the number. Shepherd is to have a new gun club. Success to you. Like to have you with us.

Du Pont Gun Club.

Wilmington, Del., Jan. 28.—Here we are again with another shoot that would make an ordinary two-day tournament look like a bob-tailed straight on a show-down, and that would please a manager of a State tournament.

We have had eight regular club shoots since the Du Pont Gun Club started, also two Thursday afternoon shoots, and here we are again with 107 entries. Now I call that a real crowd.

Remember as well, that there were over twenty rifle and revolver cranks out, all blazing away at the 75yd. targets, and as you will note from the scores, they were doing some good shooting.

The club has started something that will be of interest to your readers; that is, they have turned over to the Police Department of Wilmington, their galleries, and the Du Pont Company has tendered the service of Capt. Casey and Lieut. Harkins of the Rifle and Smokeless Division, to coach them; and what is more, knowing that the Police Department is thinking of adopting a new revolver as standard, we, the Dupont Gun Club, have ordered two revolvers, Colts, and will have them at the disposal of the Department until they adopt the gun they are considering. We are awake in Wilmington, and it will be a long time before the "sand man" strikes us again.

The scores which follow do not show the practice and extra events shot off Saturday. We devoted one trap to those desiring to get in some extra shooting, and with the help of Lloyd Lewis the trap was kept hot.

Something interesting Saturday—that match between A. B. Richardson, of Dover, Del., the present State champion, and Billy Foord, of Wilmington. If it is pleasant, we will have several thousand people out to the grounds, as there is a great deal of interest manifest.

Although the wind was unusually high, the weekly shoot of the members of the Dupont Gun Club was featured by some exceedingly high scores. The gallery was one of the largest yet assembled at the club house, and the shooters were all pleased with the workings of the three traps.

The sensation of the day was the display made by H. Winchester, who broke 12 pairs straight, this being his first attempt at doubles. This score was exceptionally good, and Mr. Winchester received the congratulations of his many friends.

H. A. Lobb was high man in Class A, having a perfect score of 25 straight; in Classes B, C and D, ties resulted. These will be decided on Saturday next.

The championship trophy, which is valued at $100, will be placed on exhibition during the coming week in the windows of Darlington & Toadvine, No. 831 Market street.

The scores made on the rifle range were also good, considering the wind.

The complete scores made yesterday were, out of a total of 25 shot at:

H W Bush	18

Hyde Park Gun Club.

Cincinnati, O., Jan. 28.—On Jan. 28, for the first time in several weeks, the club drew a pleasant day for its regular shoot, and the attendance was very good. The selection of Columbus for the next Grand American Handicap is having an effect in reawakening the interest of the shooters in this vicinity, and from now on a lot of them will get busy, so as to have a fighting chance to land the big plum guaranteed by the Association.

At to-day's shoot Welsh, who was quite prominent in the game ten years ago, showed that he had not forgotten how to point a gun, and that a little practice will put him several notches nearer the top than when he finished to-day. Irwin was trying out a new gun, and shot very consistently, though not quite up to his mark, breaking 80.5 per cent. Milt Johnson did nice work after a rest of several months. He is surely going after the prize next June, and he won't be a 100 to 1 in the betting, either. Uncle John Dea improved in each event, after making a bad start; 50 more targets would have got him warmed up to the work, and put him in his right class. Dr. Leighner had time for only two events; he fell down in the first, but in the second string he found all but one target. De Mar led the bunch and was the only one to go straight in any of the events. He shot a nice race, accounting for 92 per cent. of his targets. His new gun seems to fit him about right. Holaday did not do as well as usual, but claimed he was too near the traps. When he went back to 20yds. for the last few targets, he smashed them clean.

Irwin	20 21 20 20 20	101
De Mar	22 23 22 25 ..	92
Johnson	21 23 24 23 ..	91
Dea	16 19 21 22 ..	78
Welsh	20 14 21 15 ..	70
Holaday	21 20 18	59
Leighner	19 24	43

The Forest and Stream may be obtained from any newsdealer on order. Ask your dealer to supply you regularly.

Long Island Sound Championship.

Port Washington, L. I., Jan. 28.—Probably conditions were never more unfavorable than they were at the Long Island championship shoot, held to-day. The wind blew a gale from the west. This the shooters had to face with the consequent erratic flights so disconcerting to even the best of shooters. Only two men beat 75, which did not indicate bad shooting at that.

The winner was George K. Kouwenhoven, of the Bergen Beach Gun Club, of Sheepshead, L. I., who duplicated his performance two years ago. Of course, the real skill of the contestants could not be measured on account of the adverse weather.

The competition was held under the auspices of the Manhasset Bay Yacht Club, Port Washington. Out of the sixty-one contestants who entered, forty-one competed for the three individual prizes and team trophies. Competition was open to clubs of Long Island Sound and adjacent waters, and also to the Garden City Gun Club, Hillside Rod and Gun Club and the Crescent Athletic Club. The conditions were 100 targets, 16yds. rise.

H. L. Hoyt, Jr., took the gold medal for second place, scoring a total of 76. Stuart Scott, of the Larchmont Yacht Club, came next with 68. The field strung out all the way to some exceedingly small percentages. The summary follows:

Long Island Sound championship, strings of 25:

G W Kouwenhoven, Bergen Beach	17 22 23 16—78
H L Hoyt, Jr, Manhasset Bay Y C	19 19 20 18—76

Hart cup, 10 pair douhles:

Wm Pearsall	9
J F Taylor	8
E W Heller	11
W E Stewart	9
P S Ross	11

Won by E. W. Heller.

C H Daly	11
J A Hart	10
A L Headley	6
Peter Hauck	10

Crescent Athletic Club.

BAY RIDGE, L. I., Jan. 28.—It was a typical March day, though somewhat ahead of the season. A 50-mile gale blew from the west, making good scoring a matter of extreme difficulty at the Bay Ridge traps to-day. As was to be expected, scores averaged lower than usual, no full scores being made. With an allowance of 1, D. T. Leahy, in the contest for the J. F. James trophy, scored a leg with 24 from scratch. Leahy also scored a leg on the January cup with 24. The best three scores for the month were made by F. B. Stephenson, 24, 24 and 19, a total of 67, while J. F. James was second with 19, 20 and 18, a total of 57. James also scored a leg on the Stake trophy with 23. For the C. R. James trophy James was high with 23. The two-man team shoot was won by F. B. Stephenson. A. E. Hendrickson scored a leg on the Lockwood trophy with 22. In the event at 10 pair three tied on 11. Scores:

January cup, 25 targets, handicap:

D T Leahy	1	21	A E Hendrickson	2	12
G H Piercy	0	19	C R James	1	11
F B Stephenson	0	19	Dr Atkinson	5	9
L C Hopkins	5	17	A G Southworth	1	9
J F James	1	16			

Stake trophy, 25 targets, handicap:

J F James	1	23	G H Piercy	0	17
F B Stephenson	0	22	C R James	1	16
A E Hendrickson	2	20	Dr Atkinson	5	12
L C Hopkins	5	20	A G Southworth	1	12
D T Leahy	1	21			

C. R. James trophy, 25 targets, handicap:

C H Pulis	3	20	A E Hendrickson	2	16
D T Leahy	1	18	G H Piercy	0	13
F B Stephenson	0	19	A G Southworth	1	12
L C Hopkins	5	17			

J. F. James trophy, 25 targets, handicap:

D T Leahy	1	24	C R James	1	18
F B Stephenson	0	23	L C Hopkins	5	18
C H Pulis	3	23	A G Southworth	1	16
G H Piercy	0	20	Dr Atkinson	5	10
A E Hendrickson	2	20			

First prize won by Leahy. Shoot-off for second prize, same conditions: Stephenson 20, Pulis 17.

Team shoot and trophy, 25 targets, handicap:

F B Stephenson	0	19	C R James	1	15
J F James	0	19	C H Pulis	3	13
D T Leahy	1	19	G H Piercy	0	11
A E Hendrickson	2	19			

First prize divided between Stephenson, J. F. James, D. T. Leahy and A. E. Hendrickson.

Lockwood trophy, 25 targets, handicap:

A E Hendrickson	2	22	L C Hopkins	5	18
D T Leahy	1	20	C H Pulis	3	17
F B Stephenson	0	20	G H Piercy	0	15
J F James	1	19	Dr Atkinson	5	13
C R James	1	19			

Trophy shoot, 25 targets, handicap:

D T Leahy	1	23	L C Hopkins	5	20
F B Stephenson	0	23	J F James	1	18
G H Piercy	0	22	A E Hendrickson	2	16
C R James	1	21	Dr Atkinson	5	10

Leahy and Stephenson divide.

Trophy shoot, 25 targets, handicap:

F B Stephenson	0	22	C R James	1	18
D T Leahy	1	21	G H Piercy	0	15
J F James	1	18			

Ten pair doubles, Westly Richards gun:

D T Leahy	11	A E Hendrickson	9
C H Pulis	11	G H Piercy	7
Medler	11	F B Stephenson	7
C R James	7		

Shoot-off: Leahy and Pulis divide.

New York Athletic Club.

TRAVERS ISLAND, N. Y., Jan. 28.—The weather was far from pleasant at the Travers Island traps to-day, the high wind making all kinds of irregular flights. Competition for the monthly cup ended to-day with the strange result that no shooter scored more than one win, there thus being five wins. Fred Hodgman won without a shoot-off. The other winners were: A. M. Jones, G. J. Corbett, E. A. Wilson and F. H. Schauffler. As these shooters, Mr. Hodgman excepted, were not at Travers Island yesterday, Mr. Hodgman won by default.

O. C. Grinnell, Jr. and B. M. Higginson won two events, the former taking a leg on the Haslin cup after a shoot-off with W. B. Ogden. B. M. Higginson won the tournament cup. The Travers cup is a new trophy and will be in competition throughout the season. B. M. Higginson secured the first win on it after a shoot-of with Grinnell. In the challenge round for the tournament cup, Higginson won from Hodgman.

Trial shoot, club special, scratch, 10 targets:

O C Grinnell	8	W B Ogden	7
G F Pell	8	J M Hamilton	7
J G Battison	7	P Beale	4
B M Higginson	7	A P Walker	4

Haslin cup, 25 targets, handicap:

O C Grinnell	1	24	B M Higginson	2	20
W B Ogden	3	24	J M Hamilton	0	18
P Beale	3	23	W M Willford	1	18
G F Pell	1	23	J G Battison	2	18
F A Hodgman	0	22	A P Walker	0	12

Trial shoot, club special, 15 targets, scratch:

W B Ogden	15	O C Grinnell	12
B M Higginson	13	P Beale	11
G F Pell	13	A P Walker	11
J G Battison	12	J M Hamilton	11

January cup, 25 targets, handicap:

F A Hodgman	0	23	W B Ogden	3	19
O C Grinnell	0	23	G F Pell	1	18
G M Thomson	2	22	P Beale	3	18
J M Hamilton	0	20	J G Battison	2	17
B M Higginson	2	20	A P Walker	0	13
W M Willford	1	19			

Tournament cup, 25 targets, handicap:

B M Higginson	2	24	W M Willford	2	20
O C Grinnell	1	22	P Beale	3	20
G F Pell	1	22	J M Hamilton	0	18
W B Ogden	3	22	J G Battison	2	17
F A Hodgman	0	21	A P Walker	0	13
G M Thomson	2	21			

In challenge shoot-off B. M. Higginson, challenger, defeated F. A. Hodgman, holder, 25 to 19, after two ties.

Travers Island trophy, 25 targets, handicap:

B M Higginson	3	25	J G Battison	2	18
W B Ogden	3	25	W M Willford	2	18
F A Hodgman	0	24	J M Hamilton	0	16
G F Pell	2	23	A P Walker	0	16
O C Grinnell	1	20	G M Thomson	3	10
P Beale	3	20			

Distance handicap special trophy, 25 targets:

W B Ogden	18	18	J M Hamilton	18	16
O C Grinnell	20	18	B M Higginson	19	15
G F Pell	19	18	G M Thomson	19	13
F A Hodgman	21	18	P Beale	18	13
J G Battison	19	18	A P Walker	18	11
W M Willford	19	17			

Shoot-off of tie was won by O. C. Grinnell with a total of 20 hits.

Club special trophy, handicap, 25 targets:

W B Ogden	3	24	G F Pell	1	20
P Beale	3	23	F A Hodgman	0	20
J M Hamilton	0	22	J G Battison	2	19
O C Grinnell	1	21	A P Walker	0	18
B M Higginson	2	21			

Atlantic City Gun Club.

ATLANTIC CITY, N. J., Jan. 27.—The week-end shoot of the Atlantic City Gun Club was well attended and some good shooting was recorded.

In the challenge event for the "Western" trophy, Harrison Cook defended his win of the week before. He now has two wins, five necessary for ownership. Next week he goes up with Powers as opponent, and there should be a very close race.

In the event for the club prize, a watch fob, Adams, Deemer each received 3 points; Gladney 2 points, and Algar 1 point. This was the first shoot in this event, 15 points necessary to win. Contests to be held every week.

Targets:	25	25	25	25	25	25	Trophy event		
H B Cook	25	21	20	20	20	21	25.25	H. T'l

Keystone Shooting League.

LEBANON, Pa., Jan. 27.—Some of the best-known wing shots in the State participated in a sweepstake match at 20 live birds, which was held at Lebanon, Pa., last Thursday. Geo. M. Hansell, of this city, missed his first bird, then scored straight, dividing first money with three others. Scores: Hansell 19, Trafford 19, Yingst 19, Simmers 19, Dinger 18, Buckwalter 18, Tyson 18, Van De Sande 17, Coleman 17, Levan 16, Rader 16, Earhorn 15, Nettles 15, Zellers 15.

Coleman, from Pottsville; Dinger, from Harrisburg, are considered Class A wing shots, but were not in shape to do themselves credit to-day.

A. K. LUDWIG.

Concordia Blue Ribbon Gun Club.

CONCORDIA, Kans., Jan. 25.—Lewis and Caldwell were high men for the program of 130 targets with 125 each. Wilder second with 124. Following were the scores made:

*Professional.

Montclair Gun Club.

MONTCLAIR, N. J., Jan. 28.—The targets to-day cut some very peculiar antics, owing to the high winds prevailing. Many seemed to do their best to dodge the shot sent after them. Frazee seemed to be the only man who was on to their antics.

The leading event of the day, event 2 for the monthly trophy, 25 targets, the Kickers' handicap, easily went to Frazee, who already had one leg on the trophy, and he became the possessor of the January cup.

Event 3, 25 targets, Kickers' handicap, was tied for by Messrs. Batten and Winslow. Batten winning out on the shoot-off of the tie at a miss-and-out.

The Orange Gun Club shoot a return match at Montclair on Lincoln's Birthday, Feb. 13.

Events:	1	2	3	4
Targets:	25	H. 25	H. 25	25
Geo Batten	14	5 12	10 25	..
I S Crane	16	4 18	7 23	..
J C Atwater	14	5 22	6 22	17
Ed Winslow	18	6 22	7 25	..
Y T Frazee	19	3 25	2 21	23

Event 5, pick-up team race, 10 targets each: Frazee and Crane 19. Batten and Winslow 14.

E. WINSLOW, Sec'y.

Bryden Gun Club.

CATASAUQUA, Pa., Jan. 28.—One of the most interesting events of the year took place on Thursday. It was a 25-live-bird race between John L. Englert and Arthur Walker, $25 a side, to determine the champion wing shot of this town. Considerable side betting was going on. Englert used exceptional skill and proved the superior shot; he killed 21 out of 25 birds, while Walker killed 19.

Congratulations came to John from many of the Bryden Boys. Englert, it is said, will be a strong figure in the Harrisburg shoot on Feb. 22, and very likely he may win the State challenge trophy.

An interesting meeting was held in the club house Sunday, and July 7 and 8, 1911 was selected for the holding of the annual registered tournament. This will be a banner shoot this year. Neaf Apgar missed but 1 target out of 300, scoring 236 straight, while J. M. Hawkins scored 216 straight as high professionals. John L. Englert scored 141 straight, while J. W. Rahn, of the Hercules Gun Club, Temple, Pa., was high with 145 out of 150 the first day. Application for registration has been forwarded to E. E. Shaner, for consideration and approval.

It was voted to have our regular monthly shoots on the last Saturday of each month. All shooters are granted the courtesy of our grounds and club house.

A. K. LUDWIG.

97.28%

1910 High Amateur Average

Won by MR. J S. DAY, of Midland, Texas, using

97.28%

Peters Factory Loaded Shells

Mr. Day shot at **4280** targets in Registered Tournaments, breaking **4164**, an average of **97 28%**, exceeding by over **2%** the highest official amateur average of any previous year. During the season Mr. Day made many long runs, among which are the following:

Gorman, Texas, and Walnut Springs, Texas, August 15-17—**245** Straight
Walnut Springs, Texas, - - - - - " 17-18—**266** "
Midland, Texas, - - - - - - - " 8-9 **133** "
121 "
Big Springs, Texas, - - - - - - " 10-11 **175** "
152 "
Cisco, Texas, and Gorman, Texas, - - " 12-15—**190** "

PARTICULAR ATTENTION

is directed to the fact that all of Mr. Day's shooting was done with PETERS REGULAR FACTORY LOADS, purchased from dealers where the various tournaments were held. His shells were not special in any sense, but were regular stock goods such as can be procured from any PETERS dealer. YOU can get this SUPERIOR AMMUNITION as easily as ordinary loads. You may not always score 97.28% but you will average better than with any other make.

Shoot the shells that have established another World's Record—97.28%—the kind that do not have to be used in any special make of gun to give best results.

THE PETERS CARTRIDGE COMPANY, CINCINNATI, OHIO

San Francisco: 608-612 Howard Street. J. S. FRENCH, Manager

Registered Tournaments.

PITTSBURG, Pa.—The tournaments registered with the Interstate Association during the week ending Jan. 28 are as follows:

April 10-12.—New Orleans, La.—Louisiana State tournament, under the auspices of the City Park G. C. E. F. Leckert, Secy.
April 11-12.—Beaver Crossing, (Neb.) G. C. J. C. Evans, Sec'y.
May 23-25.—Lincoln, Neb.—Nebraska State tournament, under the auspices of the Capital Beach G. C. T. C. Brownfield, Pres.
May 24-25.—Dayton, Ky.—Kentucky State tournament, under the auspices of the Northern Kentucky G. C. Dr. I. P. Gould, Sec'y.
May 30.—York, Pa.—York City G. C. N. M. McSherry, Sec'y.
June 7-9.—Columbus, O—.Ohio State tournament, under the auspices of the Columbus G. C. Lon Fisher, Secy.
June 13-15.—Syracuse, N. Y.—New York State tournament, under the auspices of the New York State S. A. W. E. Hookway, Sec'y.
June 14-15.—Montpelier, Vt.—Vermont State tournament, under the auspices of the Montpelier G. C. H. B. Moulton, Pres.
July 9-10.—Fargo, N. D.—Gate City G. C.—Albert E. Rose, Sec'y.
Sept. 4-5.—Lynchburg. Va.—Virginia State tournament, under the auspices of the Lynchburg G. C. J. D. Owen, Sec'y.

ELMER E. SHANER, Sec'y-Mgr.

Haddonfield Gun Club.

HADDONFIELD, N. J., Jan. 23.—The Haddonfield Gun Club held an irregular or bi-monthly shoot on Saturday, Jan. 21. The shoot was the best attended and most enthusiastic of any club shoot held on the grounds for months. The scores will show the importance of the Haddonfield gunners getting busy. They should remember the adage, "practice makes perfect," and get down to work at once, or they will be tail-enders in the Philadelphia Trapshooters' League when the season is over.

James Logan won first prize. M. Manning won second. The shoot was at 25 targets, target allowance:

Fred Holloway	0	20	H Pierce	6	18
M Manning	6	21	S Bergen	3	20
Jas Logan	3	23	C Garrett	4	19
Humphreys	6	16	J Peacock	1	20
F Bogarth	6	16	Eyster	5	16
J Dungan	3	15	J Heiss	1	16
H Tompkins	4	19	C Holloway	3	16

Meadow Springs Gun Club.

PHILADELPHIA, Jan. 21.—Ties were numerous at the shoot of the Meadow Springs Gun Club to-day. There were twenty-three entrants. Eight tied out of the 23, there being some liberal allowances out of the 25 possible. Those in the tie were Hogan, Chandler, Pierce, Gideon, Hewlett, Clegg, Fry and MacAlonan. Six dropped out in the first and second shoot-offs. When it was drawn to shoot-off miss-and-out, Chandler missed his seventh target, Hogan scoring his and winning. Chandler won second place.

In addition to the high scores counting for the weekly prize, each 25 man also was given one point apiece to go to his credit on the club's yearly trophy. Next Saturday the club has arranged a special prize event, which is open to all.

Club event, 25 targets, handicap rise with added targets to score:

Pancoast, 16	8	18	Gideon, 17	4	25
Sloan, 19	2	21	Lindeman, 16	5	19
George, 17	4	24	Hewlett, 16	7	25
Hogan, 18	3	25	Mack, 16	0	17
Murdock, 17	4	24	Warren, 16	4	22
Turner, 17	4	18	Moore, 16	0	18
Gothard, 18	4	19	Fry, 16	7	25
Clegg, 18	4	25	Serfass, 16	8	22
Kernan, 16	8	23	Craig, 16	0	12
Chandler, 18	5	25	Torpey, 18	3	23
Roland, 16	5	23	MacAlonan, 16	8	25
Pierce, 17	3	25			

Shoot-off, 10 targets:

Hogan, 18	1	10	Hewlett, 16	2	8
Chandler, 18	2	10	Clegg, 18	1	0
Pierce, 17	1	8	McAlonan, 16	3	8
Gideon, 17	1	9			

Second shoot-off:

Hogan	10	Chandler	10

Miss-and-out event:

Hogan	7	Chandler	6

Chenango Fish and Game Gun Club.

NORWICH, N. Y., Jan. 29.—The Chenango Fish and Game Gun Club held its annual meeting on Jan. 27, and elected its officers for the year as follows: President, L. H. Burnside; Vice-President, Oscar Harrington; Secretary, E. D. Borden; Treasurer, Fred L. Ames. The club will hold its first shoot on Feb. 22, and its yearly registered shoot some time in the last of May or first of June. The club is in a very healthy condition, with about one hundred members on its books.

E. D. BORDEN, Sec'y.

Indianapolis Gun Club.

INDIANAPOLIS, Ind., Jan. 28.—An ideal spring day at the end of January and a good attendance marked the day at the gun club. In practice Smoke, a bit out of form, broke 49 out of his last 50 targets. Barr, a so-called professional, was admitted to the competition for the president's cup, and at once found he was in a dilemma. Consideration due the club under such circumstances demanded that he do the best he could, while on the other hand, his old friend Dixon—still without a cup—stood to win unless beaten by him. The right thought prevailed, and the summary of scores showed Barr 47, Dixon 46.

Practice:

	Shot at.	Broke
Hillis	110	87
Rising	160	135
Moller	110	97
Barr	110	98
Lewis	110	98
Britton	60	44
Clark	135	117
Dixon	85	73
Hymer	85	70
Neighbors	40	30
Osenbach	40	13
Smoke	70	67

President's cup, 50 targets:

Hillis	45	Hymer	41
Moeller	43	Osenbach	33
Lewis	45	Barr	47
Britton	42	Neighbors	35
Dixon	46	Wise	43

SECRETARY.

Newmanstown Gun Club.

NEWMANSTOWN, Pa., Jan. 23.—The shoot held by the Newmanstown Gun Club, at 20 live birds, resulted as follows:

Rader	18	Lutz	12
W W	18	Fred Wertz	16
Hanselle	19	Hendricks	17
Weik	16	Steis	16
Snow	18	Buckwalter	19
Trafford	15	Rohrig	15
Englert	18	Snyder	14
Ehrhorn	13	Patton	20
Levan	17	Murphy	16
Zellers	14	Daubert	16
W Miller	16	Lamb	14
Hoffman	16	Fulton	16
Paill	19	Budd	20
Coleman	18	Sands	16
Summers	20	Sholan	15
Lee Wertz	12	Bollman	15

Thirty-two participants in this event. Great credit is due these men, as the birds were all fast flyers.

Many of the boys will figure in the Harrisburg shoot of Feb. 22.

The great success of this shoot is due to Secretary F. S. Rader, the renowned crack shot. LUDDY.

North Caldwell Gun Club.

NORTH CALDWELL, N. J., Jan. 21.—Event No. 3 was special prize event and was won by Wm. Kussmaul, box of cigars; second Samuel Fischer, whiskbroom holder; third, Fred Sindle, shaving set.

On Feb. 4 we will hold a shoot for prizes and sweepstakes, and Feb. 13, Lincoln's Birthday, will hold a shoot for several prizes.

Targets:	11.	15	10	25	25	25	25	15	Broke.

American Duck Shooting

By GEORGE BIRD GRINNELL

NO single gunner, however wide his experience, has himself covered the whole broad field of duck shooting, and none knows so much about the sport that there is nothing left for him to learn. Each one may acquire a vast amount of novel information by reading this complete and most interesting book. It describes, with a portrait, every species of duck, goose and swan known to North America; tells of the various methods of capturing each, the guns, ammunition, loads, decoys and boats used in the sport, and gives the best account ever published of the retrieving Chesapeake Bay Dog.

About 600 pages, 58 portraits of fowl, 8 full-page plates, and many vignette head and tail pieces by Wilmot Townsend.

Price, *edition de luxe* on hand made paper, bound in buckram, plates on India tint paper, each copy numbered and signed by author, $5.00. Price, library edition, $3.50.

FOREST AND STREAM PUBLISHING COMPANY
127 Franklin Street, New York

WOODCRAFT

By "Nessmuk." Cloth, 160 pages. Illustrated. Price, $1.00.

A book written for the instruction and guidance of those who go for pleasure to the woods. Its author, having had a great deal of experience in camp life, has succeeded admirably in putting the wisdom so acquired into plain and intelligible English.

FOREST AND STREAM PUBLISHING CO., NEW YORK

YOU know mallards—wisest and wariest of all ducks—Solomons of the air. You can't knock down mallards with a paddle nor can you get them with a gun that plasters its shots all over the face of creation.

A mallard shot is generally a long shot, and long shots require a hard-shooting, close-shooting gun.

That's why the long-headed man who goes to a mallard country takes a Lefever. When he swings it on a towering pair of mallards he does not question the result. He know it—

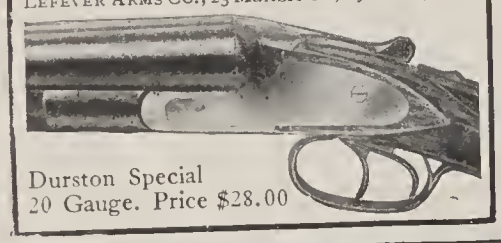
TWO CLEAN KILLS

The reason a Lefever kills clean and sure and far is **Lefever Taper Boring.**

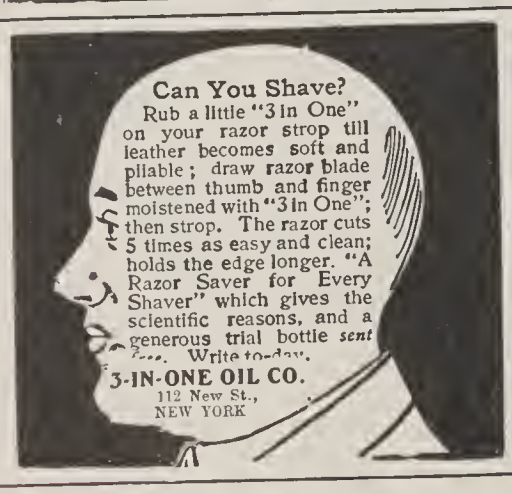
But if you buy a Lefever for the taper boring alone, you will get more than your money's worth. For instance, you will never be handicapped with looseness at the hinge joint. The exclusive Lefever screw compensates for a year's wear by a trifling turn that you make yourself with a screwdriver.

LEFEVER SHOT GUNS

Sixteen other exclusive Lefever features and Lefever simplicity and strength make the $28 gun the peer of any $50 gun on the market. Upwards to $1,000. Send for free catalog and get Lefever wise. LEFEVER ARMS CO., 23 Maltbie St., Syracuse, N.Y.



Durston Special
20 Gauge. Price $28.00



Dixon's Graphite for Sportsmen

A lubricant and preservative; for fishing rods and reels; for gunlocks and barrels; for row, sail and motor boats. Booklets "Graphite Afloat and Afield" and "Dixon's Motor Graphite" free on request.

WILDFOWL SHOOTING.

WILDFOWL SHOOTING.
Containing Scientific and Practical Descriptions of Wildfowl; Their Resorts, Habits, Flights and the Most Successful Method of Hunting Them. Treating of the selection of guns for wildfowl shooting, how to load, aim and to use them; decoys and the proper manner of using them; blinds, how and where to construct them; boats, how to use and build them scientifically; retrievers, their characteristics, how to select and train them. By William Bruce Leffingwell. Illustrated, 373 pages. Price, in cloth, $1.50; half morocco, $2.50.

FOREST AND STREAM PUBLISHING CO.

There can't be **"one shell wrong"** when they're loaded with Dead Shot. A mountain of powder comes through the mill chemically tested in each stage of its manufacture.

Dead Shot Smokeless

Trade Mark Reg. in U. S. Pat. Off.

Stability Guaranteed.

After the powder is finished, the tests continue in the shooting range. It must have a light recoil, low bursting pressure and uniform sound.

The powder in one shell must be like that in any other.

If your dealer hasn't it, we will refer you to one who has.

AMERICAN POWDER MILLS
Chicago St. Louis Boston

Columbia University Rifle Club.

NEW YORK, Jan. 24.—On Tuesday evening, Jan. 24, the Columbia rifle team shot their regular weekly shoot. The schedule would seem to indicate that we shot against Delaware College, but the reports in the newspapers seem to show that Princeton University was put in Delaware's place. The score was 1888, several points better than the previous Intercollegiate record. The individual score of 197 out of 200 made by Ehrlich was 2 points better than the record of last year, which was also made by a Columbia man, A. P. Lane. Three possibles, or 100 out of 100 were made in the prone position by Lane. Ehrlich and Krefeld. The scores follow:

	Standing.	Prone.	Total.
J Ehrlich	97	100	197
A G Hanke	94	96	190
J A Baker, Jr, captain	95	98	193
A A Leach, Jr	87	98	185
W Steinbruch	87	95	182
W J Krefeld	93	100	193
J H Northrop	93	91	184
A P Lane	94	100	194
H Saalberg	87	99	186
J R Guiteras	87	97	184
	914	974	1888
M J Cohen, substitute	95	96	191

Du Pont Rifle Club.

Revolver and pistol qualification scores, 50yds.: K. K. V. Casey 86, 83, 83, 76; E. G. Ackart 83, 76, 74, 74; John Bancroft, Jr., 69, 69, 67, 65, 62, 62; Willard Young 24, 15.

Revolver and Pistol practice scores, 50yds.: F. B. Harkins 84, 81, 71, 67, 66; E. H. Lambert 50, 49, 39; J. T. Skelly 46; William Coyne 36; Willard Young 13, 9; Carroll Coyne 12.

Rifle qualification scores, .22cal., 50yds.: C. W. Pierce 77, 75, 75, 75, 73; D. Appleby 75.

Rifle practice scores, .22cal., 50yds.: D. Appleby 75, 70, 61; J. I. Burrell 63, 59, 54; J. T. Birch 55; F. M. Whitehead 45, 39, 38; L. C. Weldin 44, 40; James R. Owens 41, 37, 37; G. E. Lambert 33, 31, 11; F. J. Gibney 21; H. C. Latimer 16; J. Thornton 15; W. S. Harkins 14.

The ties in the different classes were:

Class B: I. Turner, J. McKelvey, W. H. Neely, Stanley Steel, Clayton Leedom tied on 17.

Class C: Dr. Bedford, J. A. MacMullen, N. K. Smith, W. L. Wardell, tied on 14.

Class D—E. E. Handy, O. E. Pyle, L. J. Gibbons, tied on 9.

St. Louis Revolver Club.

JAN. 28.—Following are the unofficial scores made by the St. Louis Revolver Club:

Match 9, St. Louis vs. Spokane:

W C Ayer	44	44	46	42	45	—221
C C Crossman	37	42	44	47	43	—213
Paul Frese	46	47	37	37	45	—212
Dr M R Moore	43	41	44	42	41	—211
Geo C Olcott	35	35	41	41	43	—195—1052

Match 10, St. Louis vs. Seattle:

Dr M R Moore	47	47	43	46	46	—229
C C Crossman	47	48	43	39	42	—219
W C Ayer	44	42	47	41	37	—211
Paul Frese	40	40	44	42	44	—210
Geo C Olcott	42	40	43	39	36	—200—1069

Eastern League.

WASHINGTON, Jan. 28.—The Winchester Rod and Gun Club of New Haven, Conn., leads the teams of the Eastern League in the Intercluh series to shoot for the indoor civilian rifle club team championship of the United States against the winning team of the Western League. Results of the sixth week's shooting show the New Haven team to be the only one of the fourteen contestants with six victories and no defeats. Bridgeport, Warren, Pa., and New York city have five victories and one defeat. Savannah and Atlantic City have lost all six matches.

The scores of the week were: New Haven, Conn., defeated Atlantic City, N. J., 988 to 866; Bangor, Me., defeated Erie, Pa., 956 to 926; Birmingham, Ala., defeated Butler, Pa., 941 to 902; Warren, Pa., defeated Bridgeport, Conn., 980 to 977; New York city defeated Savannah, Ga., 976 to 817; Pittsburg, Pa., defeated Washington, D. C., 959 to 905; Portland, Me., defeated Providence, R. I., 974 to 908.

PUBLISHERS' DEPARTMENT.

It is time to think of angling. In taking stock of your tackle, if you fish with live bait, look up the Crescent bait box, made by the Geuder, Paeschke & Frey Company, 207 Fifteenth street, Milwaukee. 'Tis said to be an ideal bait box.

Hildebrandt spinners are known everywhere, but as they are being constantly improved, it is well to send for the new catalogue "C," which will be mailed on request by the John J. Hildebrandt Company, Drawer 6, Logansport, Ind. This is a 64-page booklet of rods, reels, lines, flies and spinners.

Few men possess real skill in making the highest grade split bamboo rods, but Hiram Hawes is one of them, and he has been making such rods for a great many years. If a dependable rod for fly or bait fishing or for tournament casting is wanted, ask H. W. Hawes & Co. for particulars. The address is Canterbury, Conn.

SPORT IN NEW MEXICO.

LATE in August three men came to camp with us, who were very anxious to engage in a hunt and see a live bear in his natural state and proper place in front of the hounds. We took a preliminary canter over the mountains in search of tracks, which were found about four miles from the main camp on a small stream. Owing to the scarcity of rain the so-called stream had degenerated into an insignificant water-hole and held only just enough *aqua impura* for ourselves, our horses, three donkeys and the bear. However, we could do no better, so here we camped. The river being only about a mile and a half below, we took our rods, as well as the guns and nine dogs. On our arrival the first evening it was too late to hunt with hounds, so C. and I went after grouse, while E. and J. took a turn at the trout. A., who was out for his health, remained in camp, promising to attend to the culinary department. We were not very successful, for although C. had an excellent pointer, the brush was so thick and the traveling so rough that our shooting was certainly faulty; we called it "bad powder." Be that as it may, we only got a brace of birds out of at least twelve that were flushed. The other two did not do much better, for J. was unaccustomed to the ways of the wily trout, and the big fish were for the most part higher up the stream. He did, however, hook one of about two pounds and tried to throw him out over the back of his head, with the usual heart-rending result. They brought back plenty for supper and breakfast.

Early next morning we started with the hounds through fallen timber, stumps and thick undergrowth. The dogs were all coupled except Spot, a reliable old hound, who hunts like a pointer and rarely ranges out of sight until he strikes a fresh trail. We rolled, fell and stumbled along in this way for a mile or more, having to go back every now and then to loosen the dogs, who have a wonderful knack of tying themselves up in all kinds of sailor's knots and other fantastic intricacies. Two will run in opposite directions around a bush; the rest jump over them, dive in between each others' legs and come up on the other side; and the thing is done, which takes ten minutes struggling and puzzling to undo. During this performance a puppy will usually escape, with one or two couples dangling from his neck, and go bawling through the wood as if on a hot trail, until caught and replaced.

After a mile and a half or less had been traversed, we came to a creek with very steep

ascent on either side. Here the old dog began to yell with all his might and we let the rest loose. In another three minutes the whole pack were in full cry, going up the worst side of course. They ran up for about half a mile and bayed in some quaking asp, but we were all too far behind to see anything; and they soon went on upward. All the time the rocks were getting rougher and the way more precipitous, but on we toiled. G. and C. were left in the dim distance. E. was ahead and J. and I a few yards behind, were not a little interested in the mineral we continually passed. However, he being better versed in mineralogy than myself, was sooner satisfied as to its intrinsic value and waddled on; thus it came about that I was left behind toiling slowly but surely. When I arrived near the summit, E. and J. were about 300 yards in front; on getting there I shouted and received no answer; they had gone! dogs and all, goodness knows where. Thus I reflected, "Any animal doubling on the hounds will have to come down the pass I have just come up; and if he does not double I have no chance on earth of ever seeing him or my dogs till sundown." So I lit a pipe and while taking in the situation, a fine pair of elk horns caught my eye. They were lying on a rock at the edge of the cliff, probably having been placed there by some Indian. A short examination satisfied me that I had not come all this way for nothing. Accordingly I shouldered them, with the intention of hiding and getting them at a future date. But, alas! when I was well coiled up in them something rushed past me about 50 yards to my left through the brush, and made for the pass. I cannot tell what possessed me, but for some reason or other, or no reason at all, I thought it was a deer, so I took my time getting to the brink of the precipice, for we were not hunting deer. When I did get there I heard a "yap" behind me, and here was a hound in close pursuit; and about 300 yards below, disappearing into some scrub, was a cinnamon bear with two tiny cubs. I fired two or three random shots without effect. Then G. fired three times from the opposite hill, but the bear was too fast and too far off. The old hound went on, and then came a pup, both were tired and footsore, not having been out before this since early in the spring. The rest being young dogs and wild from want of exercise, overran the trail; anyway, they did not put in an appearance until late that evening.

Having satisfied myself that the tired old hound and pup would never overhaul that bear with her two cubs to protect, I again shouldered my elk horns and rifle and began my descent, soon to meet C. and J., the latter somewhat excited at having seen and shot at his first bear. "It was a buster," he said, but I thought it was rather small. Below we met J. and E., who had gone round and come down ahead of us, having seen nothing.

But the tale of the day has yet to be told, for shortly after we had left in the morning the Mexican tending the stock had run in to acquaint G. with the welcome fact that a bear was within 50 yards of his tent and had not yet seen him. Out he went with his little .44, and there sure enough was our old cinnamon, minus her cubs, taking a bath in our drinking water to cool off a bit after her run. This was too much for G.'s nerves, and up went his gun. Snap! There was no cartridge in. She heard the click and was gone. Oh, mortifying moment for G.! He fired into the brush, but that was the last time the old lady visited the locality. That night the cubs came around camp to hunt their mother and caused an awful commotion among the stock.

The next day we had another unsuccessful run, I think after the same bear; but she had been traveling all night and we ran all day without overhauling her. An amusing incident occurred to C. and G. They were again left behind, sitting on a log in the road indulging in the fragrant weed, when G. suddenly jumped up and shouted, "There's a bear!" C. fell backward over the log in his hurry to rise; and his gun flew over his head. He gained his feet, however, in time to take part in the roar of in-

The PARKER GUN Again a Winner!

On January 11-13, 1911, The "OLD RELIABLE" PARKER GUN, shot by Howard D. Bates, of Ridgetown, Ont., again won the Grand Canadian Handicap at live birds, killing 25 straight and 9 in the shoot-off, from the limit distance of 31 yds. Mr. Bates shot at 54 birds during the tournament and killed them all. THIS IS SOME SHOOTING!

Marlin Big Game REPEATING RIFLES Model 1893

The Special Smokeless Steel barrel, rifled deep on the Ballard system, creates perfect combustion, develops highest velocity and hurls the bullet with utmost accuracy and mightiest killing impact.

The mechanism is direct-acting, strong, simple and perfectly adjusted. It never clogs. The protecting wall of solid steel between your head and cartridge keeps rain, sleet, snow and all foreign matter from getting into the action. The side ejection throws shells away from line of sight and allows instant repeat shots, always.

Built in perfect proportion throughout, in many high power calibers, it is a quick handling, powerful, accurate gun for all big game.

Every hunter should know all the *Marlin* characteristics. Send for our *free* catalog. Enclose 3 stamps for postage.

THE NARRATIVE OF A SPORTSMAN

INTER-OCEAN HUNTING TALES

EDGAR F. RANDOLPH

A series of hunting reminiscences of rare charm for the sportsman and for the wider circle which delights in true tales of outdoor life. With none of the high coloring and exaggeration which give a false note to so many hunting stories, Mr. Randolph's book is never lacking in interest.

He covers the field of sport with the rifle, east and west, drawing a vivid word picture of life in the open, subordinating his own exploits to the main incidents of outdoor experience, giving much valuable information on camp life, hunting and the habits of wild game, and continually delighting the reader with the freshness of his viewpoint.

This book will strike a sympathetic chord in the memory of every big-game hunter of experience and will prove of real value to the novice who is planning an excursion into the wild.

A Classic for Sportsmen

AMERICAN BIG GAME IN ITS HAUNTS

Boone and Crockett Club Series

Edited by GEORGE BIRD GRINNELL

An invaluable work not alone for the sportsman, but for the student and lover of wild life. Treats of big game preservation and protection in the broader sense; tells of the habits, habitat and life history of the larger wild animals; touches upon the problem of the public forest domain, and is rounded out by interesting hunting reminiscences by such leaders in the fraternity of big-game hunters as Madison Grant, Paul J. Dashiell, George Bird Grinnell, Jas. H. Kidder and W. Lord Smith. Bound in cloth, library edition, heavy paper, richly illustrated, 497 pages.

Postpaid, $2.50

FOREST AND STREAM PUBLISHING CO., 127 Franklin Street, NEW YORK CITY

effectual shots that followed the intruder. It was a small brown bear, and was walking steadily toward them about 25 feet away when first observed, doubtless having been frightened out of its midday slumbers by the distant baying of the hounds.

However, a great part of our object was achieved; and if we had not been able to kill a bear for our friends, we had shown them four in two days, running about wild in their native woods. They were pleased, and so were we, for the bears were thin and the hides poor; so there was not much lost.

The next day we parted, J., G. and C. to their gold mine abouty thirty miles distant, and we to Stinking Lake, so named from its sulphuric properties. Here we brought to camp plenty of ducks, mostly canvasbacks, 18 coyotes, 2 Canada geese, which E. shot right and left with his 12-bore. Those ducks must have had a rough time, for the day before we left a large party from Denver arrived with boats and decoys. But there were plenty for all, and more too. We prefer driven birds, for ducks flying over a hide on a narrow strip of land, from one water to another, go very fast and afford rare sport, besides requiring a certain amount of practice, as any of your readers are well aware who have tried it.

Having all the smoked birds we wanted for winter, we wended our way in the direction of Señor Patricio Chavez's ranch at the head of the Galena Cañon. We met him on the road, and he told us where one of his steers had been recently killed by a bear. The following morning the dogs were off again; we soon found the bear's fresh track. Away they went, and after five miles scrambling and crawling over hill and dale, we came to a fine old cinnamon treed about 500 feet below us. The dogs were all there, yelling lustily at the foot of the gigantic pine, in which he considered himself safe. A glance showed that there was nothing for it but to run a mile or more around the cañon before commencing the descent, so stumbling over anything and everything we rolled to the bottom amid a shower of loose earth and rocks. The first man who arrived within shot was Charlie, who fired at once, as the old fellow showed signs of coming down to make a firmer acquaintance with us; but this we did not at all desire. He fell, shot through the brain, and proved to be a beauty, with a long coat and a hundred pounds of lard on him. The meat was also very acceptable, for he had fed chiefly on the sweet little nut known as the piñon, with the addition of the prime beef he so lately brought to his larder.

The next day we got two black-tailed deer; but seeing no more bear sign we moved into the Chama Cañon with two inches of snow outside and six turkeys inside. There were more turkeys killed, but unfortunately the boys hung them up with the intention of fetching them next day; the wild turkey has a strong scent and the cats and coyotes got there first.

A. C.

STILL PLENTY OF BEAVER FUR.

"SEVERAL years ago the beaver was becoming rare in Ontario," said Lieut-Gov. John M. Gibson of the province of Ontario. "But the beaver has so multiplied that steps have been taken that will permit his capture, the revenue for the hide being used for park purposes. In Algonquin Park, where no shooting of fur animals is allowed, they are simply tumbling over one anothter. So it is with some of the other smaller animals.

"In the far north there are a few herds of buffalo left, but the buffalo hide is no longer an article of commerce. The musk ox, which seems to be an excellent substitute for the buffalo, appears capable of furnishing a long, continuous supply of comfortable robes, but I rather think the Indian has disposed of a great many and that the animal is not to be found as extensively in northern Canada as was supposed.—Washington Herald.

BECKING FOR GROUSE.

On the Scottish moors, where for many years it has been customary to drive grouse to the guns, it is supposed that the number of birds left over for the breeding season can to a greater or less extent be regulated by this method. In many instances this is not so, for the birds have changed their habits since the days of our forebears, when shooting over dogs was the customary plan.

Years ago, when driving was first instituted, the birds were content to crouch down and hide in the long heather for safety, but continual driving has changed their plans entirely, and now, if the ground shot over be at all hilly, they take to the higher stretches, from which they can easily keep an eye upon the advance line of the beaters.

On ground which is low-lying they may, as a rule, be out-maneuvered, for if they can be well flanked and turned by the stops left at certain places for the purpose they are obliged to go right on to the guns stationed in the line of butts ahead.

Among the hills and higher ground these driving tactics are impossible, and at the season's termination it will be found that far too many of the young birds have been shot on the low ground, leaving a too numerous quantity of old cocks who are wise, and hie them early to the tops, where they find sanctuary. There they remain until the commencement of the breeding season, when they descend from their mountain fastnesses and take possession of the best breeding sites, driving away all the younger and healthier cocks from their chosen domain. These old customers allow no others of their kind to come near them, and, though quantities of them are thus left, they are practically useless for breeding purposes, as all other birds move off and leave them.

There is but one sure and certain method of getting rid of these troublesome old birds, which years ago was a common practice, but which of late has fallen almost into disuse, and that is the art of "becking." It consists of calling them up to within range of the hidden gunner, just as the turkey-hunter of America does with the wild gobblers of the woods. To learn this method of calling it is best to take the grouse themselves as teachers and try to imitate their voices, which resound on all sides in the early morning hours. A tobacco pipe used scientifically is as good as any other instrument for successful reproducing the cry of the cock grouse, though a good deal of practice is necessary in order to become an adept at it.

In the early mornings the wary old cocks challenge each other, fluttering straight up into the air as they sound their battle-cry. Late in the season this challenge is seldom accepted, for by then all differences of opinion between the old fellows has been satisfactorily settled. When the keeper or shooter, however, arriving on the ground before laybreak gets hidden in some peat-bog or other convenient shelter and utters his challenge, then the air resounds with the cries of all the cocks within hearing, eager to do battle with the new intruder who has dared to set foot upon their chosen domain. As the hidden gunner perforce must remain stationary and under cover, the birds have to seeek for the intruder, and thus approach within range of his gun.

The gun is mercilessly leveled upon him as he struts upon the heather, and just as mercilessly is the trigger pulled, which completes the old cock's downfall. Previous to the custom of driving, this method was the only successful way of getting birds after they had imbibed the spirit of winter mildness, and was practiced simply as a means of securing birds for the larder. Had it been carried out more systematically, in order to thin out the ranks of the worthless old cocks, moors would have generally benefited thereby. It was not looked upon as sport, but only as a necessary practice; but whenever it can be managed a small-bore rifle changes it from mere slaughter into something closely akin to sport while yet accomplishing the vital object.

Big Hunters Talk To You In The Outer's Book The world's foremost gun sportsmen contribute regularly to its pages practical, snappy articles telling about the new kinks and tricks in all kinds of shooting. Their suggestions on marksmanship, stalking and firearms will help you bag more game, big and little. We pay these men a high price for their articles because they furnish LIVE, inside information from unquestioned authorities.

SNAP UP THIS SPECIAL OFFER THREE MONTHS FOR 25 CENTS

To prove its practical value and intense interestingness, we will send you The Outer's Book, (regular subscription price $1.50 a year) three months for 25 cents.

The cherished secrets of the world's best shots, live stories of thrilling experiences with gun and rod, ripping pictures from outdoor life—are spread out for you in its pages. Get your quarter into the mail today and see for yourself how valuable and fascinating THE OUTER'S BOOK really is.

Rhymes of The Stream and Forest

FRANK MERTON BUCKLAND

One of the freshest, most delightful collections of outdoor verse offered for many a day. They are the outpourings of a spirit which loves nature, the woods and streams and growing things, and appreciates its charms.

Mr. Buckland's verse has a charm that is at once rare and delightful. This book will appeal to every outdoor man or woman, and particularly to the "Brethren of the Angle."

Its form is as attractive as its pages, closely simulating the appearance of the standard fly-book, printed on heavy laid paper with ornamental border designs of trout flies, pocket for clippings, and blank pages for copying or individual composition. It is just the thing for the den, for the pocket, or for a gift to the friend who loves the big world out of doors.

Postpaid, $1.25

Nursing vs Dosing.

A Treatise on the Care of Dogs in Health and Disease. By S. T. Hammond ("Shadow"), Author of "Training vs. Breaking." 161 pages. Cloth. Price, $1.00.

Mr. Hammond believes that more dogs are killed by injudicious doctoring than by disease, and the present work is a protest against the too free use of medicine when dogs are sick. The author has given especial attention to many of the troubles which especially afflict small dogs kept in the house, and likely to suffer from lack of exercise and from over-feeding; and boys and girls owning dogs—as well as children of larger growth—may profitably study and ponder this volume.

Contents: Importance of Nursing. Cleanliness. Out-of-Sorts Dam. Puppies. Diet. Other Foods. Kennel and Exercise. Common Ailments. Teething. Diarrhea. Convulsions. Epilepsy. Distemper. Eczema. Need of Proper Care. Sour Stomach. Vermin. Canker of the Ear. Mange. The Nervous System. Abscesses. Colic. Worms.

A Problem's Solution

LOG CABINS & COTTAGES;

How to Build and Furnish Them.

A seasonable book when all minds are bent on the problem of getting close to nature. Mr. Wicks in this delightful book offers timely advice to every one who wants to build a simple summer home at one with its surroundings of wood or stream or shore.

This is a thoroughly practical work, treating of the how, the where, and the with what of camp building and furnishing. It is helpful, too, in regard to furnishing, and withal a most beautiful work.

Cloth, profusely illustrated, $1.50 postpaid.

FOREST AND STREAM PUBLISHING CO.

Where, When and How to Catch Fish on the East Coast of Florida

By Wm. H. Gregg, of St. Louis, Mo., assisted by Capt. John Gardner, of Ponce Park, Mosquito Inlet, Fla. With 100 engravings and 12 colored illustrations. Cloth. Illustrated. 238 pages. Map. Price, $4.00.

A visitor to Florida can hardly make the trip without this book, if he is at all interested in angling. It gives a very complete list of the fishes of the East Coast of Florida, and every species is illustrated by a cut taken from the best authorities. The cuts are thus of the most value to the angler who desires to identify the fish he takes, while the colored plates of the tropical fish shown in all their wonderful gorgeousness of coloring, are very beautiful. Besides the pictures of fish, there are cuts showing portions of the fishing tackle, which the author uses. A good index completes the volume.

FOREST AND STREAM PUBLISHING CO.

The Pistol and Revolver.

By A. L. A. Himmelwright, President U. S. Revolver Association, Director New York State Rifle Association.

A handy pocket-size volume of 157 pages of practical information, covering the entire subject of Pistol and Revolver Shooting. This work is strictly up-to-date, including the latest development in smokeless powder; the 1908 Revolver Regulations and Practice of the United States Army, the United States Navy, and the National Guard; the Annual Championship matches and Revised Rules and Regulations of the United States Revolver Association, etc. Besides being a useful, practical handbook for the experienced marksman, the work will also prove particularly valuable for beginners.

Contents: Historical: Arms—Military, Target, Pocket Ammunition; Sights; Position; Target Shooting; Revolver Practice for the Police; Pistol Shooting for Ladies; Clubs and Ranges; Hints to Beginners; Selection of Arms; Manipulation; Position and Aiming; Target Practice; Cleaning and Care of Arms; Reloading Ammunition—primers, shells, bullets, powders, reloading. Appendix—Annual Championship Matches of the U. S. Revolver Association; Rules Governing Matches, etc. Records of the U. S. Revolver Association.

In three styles: Paper, 60 cents. Cloth, $1.00. Full morocco, $1.50. A liberal discount to military organizations and shooting clubs on orders of ten or more copies.

FOREST AND STREAM PUBLISHING CO.

The Indians of To-day.

By George Bird Grinnell. Demi-quarto, 185 pages, buckram. Price, $5.00.

It describes the old-time Indian and the Indian of to-day, and contrasts the primitive conditions and ways of living with those of the present. It contains over fifty full-page portraits of living Indians from photographs.

Contents: The North American Indians. Indian Character. Beliefs and Stories. The Young Dogs' Dance. The Buffalo Wife. A Blackfoot Sun and Moon Myth. Former Distribution of the Indians. The Reservation. Life on the Reservation. The Agent's Rule. Education. Some Difficulties. The Red Man and the White.

FOREST AND STREAM PUBLISHING CO.

The Story of the Indian.

By George Bird Grinnell, author of "Pawnee Hero Stories," "Blackfoot Lodge Tales," etc. 12mo. Cloth. Price, $1.50.

Contents: His Home. Recreations. A Marriage. Subsistence. His Hunting. The War Trail. Fortunes of War. Prairie Battlefields. Implements and Industries. Man and Nature. His Creation. The World of the Dead. Pawnee Religion. The Old Faith and the New. The Coming of the White Man. The North Americans—Yesterday and To-day.

FOREST AND STREAM PUBLISHING CO.

Sam Lovel's Boy.

By Rowland E. Robinson. Price, $1.25.

Sam Lovel's Boy is the fifth of the series of Danvis books. No one has pictured the New Englander with so much insight as has Mr. Robinson. Sam Lovel and Huldah are two of the characters of the earlier books in the series, and the boy is young Sam, their son, who grows up under the tuition of the coterie of friends that we know so well, becomes a man just at the time of the Civil War, and carries a musket in defense of what he believes to be the right.

FOREST AND STREAM PUBLISHING CO.

Gas Engines and Launches.

Their Principles, Types and Management. By Francis K. Grain.

The most practical book for the man or boy who owns or plans to own a small power boat. It is motor launch and engine information boiled down and simplified for busy people, and every line of it is valuable. Cloth, 122 pages. Postpaid, $1.25.

Trap-Shooters' Ready Reckoner.

For ascertaining at a glance the Division of Moneys in trapshooting. Paper, 25 cents.

FOREST AND STREAM PUBLISHING CO.

Becking was, of course, in most cases limited by the capacity of the larder, for once this was filled it was sheer waste to go on shooting, and in those days cold storage was a thing unheard of. To-day we can keep birds from season to season, and can choose young birds for the purpose instead of the tough old cocks.

When the broods are packed together calling is of little avail, for in answer to the gunner's challenge so many replies will be heard that the birds refuse to walk out and do battle, being content to simply reply and remain where they are. Becking is the only sure method of regulating the supply of cock grouse on a moor, and probably the huge bags obtained in the 70's were the result of this automatic selection. Whenever the practice can be carried out it is wise to do so, and will most certainly benefit any moor to a tremendous extent by getting rid of many tough and ancient birds not worth their keep.—Richard Clapham in the Shooting Times.

AERIAL SPECULATION.

The American sportsman who proposes to shoot ducks from his aeroplane appears to be unnecessarily troubling himself by taking with him his 20-bore gun. In the current number of the Review of Reviews Mr. Stead suggests the better way. It is to drop bullets on the ducks instead. Incidentally, this simple plan has the additional advantage that it will abolish warfare. It is pointed out that, "If he (the airman) is 1,000 yards aloft, each bullet will have a velocity of 400 feet per second when it strikes the earth." Further, it is said that "it will be of no avail firing at them (the aeroplanes), for the bullets fired up into the air will come down again on those who fired them in quite as deadly a shower as those discharged by the enemy."

One supposes that bullets or shot fired up into the air always do come down again. As was remarked by the poet who shot an arrow into the air, the arrow fell he knew not where. That usually happens with bullets or shot. Wherever bullets fired at an aeroplane might fall, they certainly would not fall on the firer. A bullet dropped from a given height, and a similar bullet fired upward and falling from the same height would reach the ground with the same velocity in foot seconds. The velocity would be that accelerating velocity which the text books call *g*. In vacuo it represents about 32 feet for each second of fall, i. e., 16 feet in the first second, 16+32=48 feet in the next second, 48+32=80 feet in the third second, and so on. Against that there is the resistance of the air, which stops a rifle bullet with 2,600 f.s. velocity, to be allowed for. There is no simple law connecting the resistance of the air to a projectile with the velocity at which it is moving, and, in addition to any question of velocity, the weight of the dropped bullet would need to be considered in determining the energy it would be able to expend in hitting the man, or the duck, beneath. The calculation of 400 f.s. indicates distinctly the advisability of providing troops with steel umbrellas.—County Gentleman.

SALMON LEAPED INTO BOAT.

A curious thing happened at Dunfallandry, Pitlochry, during the night a few days ago. The Tummel was in high flood and Stewart Fergusson's oversman went down early in the morning to see to the safety of one of the boats, riding in the river at the end of a long pole and about fifteen feet from the bank.

There had been a lot of rain during the night and the boat had about nine to ten inches of water in her, in the middle of which floated a fine, almost clean, salmon of about twenty pounds. It was still alive, though much exhausted, as the water had become quite deoxygenized. It had leaped into the boat during the night. The sides of the boat are quite fifteen inches above the water line. The salmon soon revived and swam away after being put into some clear water.—London Globe.

For Sale.

Small-Mouth Black Bass

We have the only establishment dealing in young small-mouth black bass commercially in the United States. Vigorous young bass in various sizes, ranging from advanced fry to 3 and 4 inch fingerlings for stocking purposes.

GUNNER GUMPTION'S
LANTERN LECTURETTES ON

GREENER GUNS

The Greener Treble Wedge Fast Action.—Many methods of uniting the top of the standing Breech and upper portion of the gun barrels have been introduced, but none are so strong and thorough as the Greener Treble Wedge Fast Cross Bolt, which has been proved by actual experiment to add enormously to the safety and wear of a gun.

At the famous London *Field* explosive trials of 1878, a special experimental gun was prepared by the editor of the *Field*, and the following extracts from his report are a remarkable testimony to the strength and efficiency of this device.

"to this action we had a little apparatus fixed as shown in this sketch. by this arrangement a piece of silver paper can be strained between the hook and the screw clip. attached to the barrels so that when any separation takes place during an explosion the paper breaks. We found that in Mr. Greener's action no breakage occurred. using any charge of powder which the cartridge case could be made to hold with the bolt in position the paper remained intact up to the last"

In these experiments a charge of 65 grains of Schultze powder and 2 ounces of shot was used without causing the breech to "give" in the slightest degree

See that your new gun carries the Greener guarantee—Life-long satisfaction.

American Duck Shooting

By GEORGE BIRD GRINNELL

No single gunner, however wide his experience, has himself covered the whole broad field of duck shooting, and none knows so much about the sport that there is nothing left for him to learn. Each one may acquire a vast amount of novel information by reading this complete and most interesting book. It describes, with a portrait, every species of duck, goose and swan known to North America; tells of the various methods of capturing each, the guns, ammunition, loads, decoys and boats used in the sport, and gives the best account ever published of the retrieving Chesapeake Bay Dog.

About 600 pages, 58 portraits of fowl, 8 full-page plates, and many vignette head and tail pieces by Wilmot Townsend.

Price, library edition, $3.50.

Price 10 Cents

HERE'S ONE FROM TEXAS

"Some time ago I wrote you, requesting you to send me your catalog of guns. I received the catalog all right, and right away ordered a No. 525 grade gun through my dealer.

I received the gun in due time and I want to congratulate you for manufacturing the best guns for the trap-shooter that were ever devised. As soon as I got my gun, I went straight to the trap ground to try it out, and I broke 49 out of 50 the first time that I ever shot it.

I made better scores from that time on than I ever made before. I finally wound up the season by winning the championship medal of our club, with a score of 98 out of 100.

I have tried lots of different makes of guns but the STEVENS for me every time.

I thank you very much for your kind advice regarding trap-shooting. It has been a great benefit to me and I would be glad if you could give me some more points".

If a man can improve his score at the traps like this, he certainly can do just as well in the field.

The No. 520 Field Grade is the king of Repeating Shotguns.

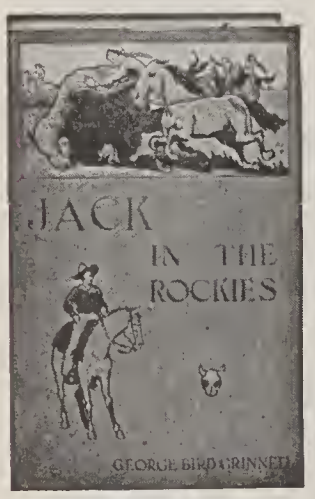
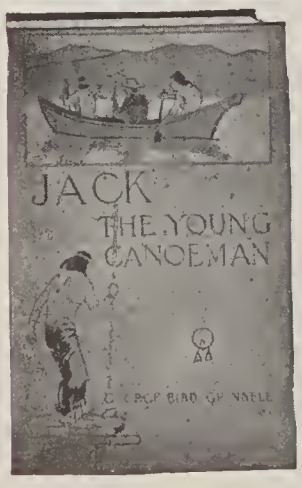
THE JACK SERIES

Best Books For Boys

By GEORGE BIRD GRINNELL





THE solution of the parents' problem of providing for the growing boy reading at once healthy and satisfying to his craving for action and adventure. In the Jack Books the longing of the normal boy for Western stories is gratified, the interest is absorbed and the mind is unconsciously led to phases of life that are elevating and instructive.

The books are the story of a young New York lad, sent to Stillwater ranch in the Rockies for his health, who becomes the companion of a veteran of the frontier. For each of six succeeding years he is led through new territory and experiences, accumulating much of the lore of plain and mountain, enriched with tales of the old West.

Ranch life, travel and hunting on the lonely plains, Indian camps, mountain climbing, trapping and canoeing are described. There is not a dull page, and the author manages to put much of the spirit of the West into his books. Jack is a real boy, and the books are stories for live boys—not lectures in disguise.

$1.25 per volume, postpaid. $7.50 per set

American Game Bird Shooting

By George Bird Grinnell

This new book covers the whole field of upland shooting in America as this field has never before been covered, and is intensely interesting and useful to everyone who uses the shotgun. It deals with the birds followed with dog and gun by the upland shooter, and describes the habits of the woodcock, snipe, all the North American quail, all the grouse and the wild turkeys.

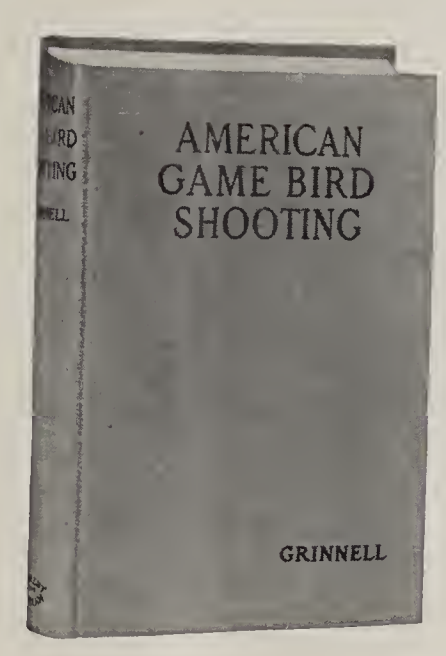
The completion of this book was a large task, requiring exceptional qualifications, knowledge and experience, and was never before accomplished by any other author.

It is the companion volume to Mr. Grinnell's book, "American Duck Shooting." Thus the two books cover the entire field of game birds taken with the shotgun, with complete description of their natural history features.

"A very complete monograph for sportsmen and naturalists....with anecdotes, of his own and others....the book will be enjoyed not only by sportsmen but by the general reader."
—The Sun, New York.

"An important, thoroughly reliable and well written book; a work that will be read with interest and pleasure by sportsmen. The work is the first complete one of its kind."
—The Boston Globe.

"No book as good as this on the subject treated, nor so fully covering the field, has been produced." **—The Salt Lake Tribune.**



"This volume is especially welcome—a treat to every man who loves to tramp the uplands with dog and gun." **—Inter-Ocean, Chicago.**

"Each bird is taken up in turn, the best methods to hunt, the selection of guns and loads, clothing and dogs are set forth simply and fully."
—Baltimore American.

"It is, I think, a model of what such a book should be—but so seldom is. It is, indeed, much more than a treatise on field sports, for it furnishes such full and excellent life histories of the birds of which it treats that it should find a place in every library devoted to pure ornithology."
—William Brewster, Cambridge, Mass.

PART I. Describes in detail the ways of life of all the American Game Birds; woodcock, snipe, bobwhite, mountain quail, California quail, Gambel's quail, scaled quail and Mearn's quail; dusky grouse, Franklin's grouse, Canada grouse, ruffed grouse, all the ptarmigan, pinnated grouse, sharp tail grouse and sage grouse, and the wild turkeys.

PART II. Is devoted to upland shooting. Here are described at length and in detail all the various methods of taking all the birds mentioned above, and the various aids to shooting, such as guns and loads, dogs and clothing.

PART III. Deals with the shooting of the past and future; tells of the efforts to introduce foreign and native game birds to restock our covers, and of the successful attempts by Dr. Clinton F. Hodge to rear in captivity the ruffed grouse and bobwhite.

The volume is handsomely illustrated. There are colored plates of the ruffed grouse and the quail, made by America's greatest bird painter, Louis Agassiz Fuertes, and 48 other full page plates, most of them photographs from life, showing portraits of different species of birds and interesting shooting scenes. In the text are a number of useful and interesting line cuts. Everyone who delights in the outdoor life and rejoices in tramping the field and woods with dog and gun should possess this handsome volume, which speaks the final word on upland shooting, as its predecessor in this field did on wildfowl shooting.

Cloth. About 575 pages. Price $3.50 net. Postage 25 cents.

Uncle Lisha's Shop.

By Rowland E. Robinson. Life in a Corner of Yankeeland. The shop itself, the place of business of Uncle Lisha Peggs, bootmaker and repairer, was a sort of sportsman's exchange, where, as one of the fraternity expressed it, the hunters and fishermen of the widely scattered neighborhood used to meet of evening and dull outdoor days "to swap lies." Cloth. 187 pages. Price, $1.25.

Sam Lovel's Camps.

Rowland E. Robinson. Another charming story of life in innermost Yankeeland. Quaint and delightful stories of a delightful life. A splendid book for boys and scarcely less pleasing to their elders. Cloth. Illustrated. Postpaid, $1.00.

American Big-Game Hunting.

The Book of the Boone and Crockett Club. Theodore Roosevelt and George Bird Grinnell, editors. Narratives of white goat hunting, elk hunting, old times in the Black Hills, prong-buck coursing, nights with the grizzlies, buffalo days, blacktails in the Bad Lands, notes on forest reservations and game refuges. Contributors: Theodore Roosevelt, George Bird Grinnell, Owen Wister, Winthrop Chanler, Col. Geo. S. Anderson, Col. Roger D. Williams, Archibald Rogers, F. C. Crocker, Dean Sage, and others. Cloth. Illustrated. Postpaid, $2.50.

Trail and Camp-Fire.

The Book of the Boone and Crockett Club. Editors: George Bird Grinnell and Theodore Roosevelt. Illustrated. Like its predecessors, the present volume is devoted chiefly to the great game and outdoor life of Northern America; yet it does not confine itself to any one land, though it is first of all a book about America, its game and its people. Cloth, 353 pages. Price, $2.50.

American Big Game in Its Haunts.

The Book of the Boone and Crockett Club for 1904. George Bird Grinnell, Editor. This is a fourth and by far the largest and handsomest of the club's books. It opens with a sketch of Theodore Roosevelt, founder of the Boone and Crockett Club, and contains an extremely interesting article from his pen descriptive of his visit to the Yellowstone Park in 1903. Other papers are on North American Big Game; Hunting in Alaska; The Kadiak Bear; Moose, Mountain Sheep; Game Refuges, and other big game topics. 490 pages and 46 full-page illustrations. Price, $2.50.

American Duck Shooting.

George Bird Grinnell. With 58 portraits of North American Swans, Geese and Ducks. Plans of Boats and Batteries. Fifty Vignettes in the text and a chart of the topography of a duck's plumage. Cloth, 630 pages. Price, $3.50. Edition de luxe, price, $5.00.

The Art of Shooting.

Charles Lancaster. An illustrated treatise on the art of shooting. Illustrated. Cloth. Price, $1.25.

The Gun and Its Development.

W. W. Greener. With Notes on Shooting, Breech-loading Rifles, Sporting Rifles, Shotguns, Gunmaking, Choice of Guns, Choke-boring, Gun Trials, Theories and Experiments. "The Gun and Its Development" is the standard work of the age on projectiles and all relating to them. Fully illustrated. Cloth. 770 pages. New edition. Price, $4.00.

Domesticated Trout.

Livingstone Stone. Contents: Trout Breeding Works, Ponds, Buildings, Hatching Apparatus. The Nursery, Taking the Eggs, Hatching, Care of Alevins, Rearing the Fry, Growing the Large Trout, General Observations. Cloth. Illustrated. Postpaid, $2.50.

Modern Fishculture in Fresh and Salt Water.

Fred Mather, author of "Men I Have Fished With." with a chapter on Whitefish Culture by Hon. Herschel Whitaker, and a chaper on the Pike-Perch by James Nevin. Illustrated. Price, $2.00.

Familiar Fish and How to Catch Them.

Eugene McCarthy. A Practical Book on Fresh-Water Game Fish. With an introduction by Dr. David Starr Jordan, President of Leland Stanford Junior University, and numerous illustrations. Price, $1.50.

Training the Hunting Dog for the Field and Field Trials.

B. Waters. This is the latest and best manual on the subject. As an owner and handler of field trial dogs, and one having had an exceptionally wide experience in the field and at field trials, Mr. Waters was admirably equipped to write such a work. It has already taken its place as the standard authority. Cloth. 281 pages. Price, $1.50.

Log Cabins and Cottages.

William S. Wicks. This book covers building for the woods from the simplest shelter to the most elaborate cottage, cabin or house, and their furnishing and fitting. The details and directions are at once simple and comprehensive, and the illustrations are numerous and illuminative. Cloth. Illustrated. 44 full-page plates and numerous text illustrations. Postpaid, $1.50.

Pocket Kennel Record.

A handy book for immediate record of all events and transactions, relieving the owner from risk of forgetting important kennel matters by trusting to memory. Morocco. Postpaid, 50 cents.

Diseases of the Dog.

By Hugh Dalziel. A handbook for amateurs. Treats of the causes of disease in dogs, symptoms and treatment, modes of administering medicine, treatment in cases of poisoning, etc. Paper. Postpaid, 40 cents.

The Spaniel and Its Training.

F. H. Mercer. To which are added the American and English Spaniel Standards. Cloth. Illustrated. Price, $1.

Pheasants; Their Natural History and Practical Management.

W. B. Tegetmeier. New, enlarged edition. 16 plates. Cloth. 237 pages. Price, $3.50.

Woodcraft.

Nessmuk. No better book was ever written for the help and guidance of those who go into the woods for sport and recreation. It is simple and practical, and withal a classic, written with a rare and quaint charm. Cloth. 200 pages. Illustrated. Postpaid, $1.00.

Houseboats and Houseboating.

Albert Bradlee Hunt. The book contains forty specially prepared articles by owners and designers of well-known houseboats, and is beautifully illustrated with nearly 200 line and half-tone reproductions of plans and exteriors and interiors. A most interesting chapter is devoted to houseboating in England. Extra heavy paper, buckram. The price is $3.00 net. Postage, 34 cents.

How to Build a Motor Launch from Plans.

Charles G. Davis. A thoroughly practical guide for the amateur. Shorn of all blind technicalities, it considers displacement, good construction and faulty, stability, setting up the keel, framing and planking, with careful explanations. Each step is followed up to the care and running of the gas engine. Cloth, 9 folding drawings, 8 full-page plates, 40 smaller diagrams, 170 pages. Postpaid, $1.50.

Manual of the Canvas Canoe.

F. R. Webb ("Commodore"). Many illustrations of designs and plans of canvas canoes and their parts. Two large, full-sized working (24x38) drawings in a pocket in a cover. Cloth, 115 pages. Price, $1.25.

Canoe and Boat Building.

W. P. Stephens. Contains plan and comprehensive directions for the construction of canoes, row and sail boats and hunting craft, directions that the amateur with tools can follow. Fifty plates and working drawings in separate envelope. Cloth. Illustrated. 264 pages. Postpaid, $2.00.

Canvas Canoes and How to Build Them.

Parker B. Field. The book gives very precise instructions by which a man with ordinary mechanical bent may build a serviceable canoe at slight cost—a plan and all working directions. Paper. Postpaid, 50 cents.

No. 6
KEEPING POSTED

1. As you read Forest and Stream through each week, you are frequently reminded of one thing or another that you desire to purchase. Such and such must be supplied to make your Shooting, Fishing, Camping or Cruising outfit complete.
2. Possibly you need waterproof shoes, or waterproof clothing. Or a new tent? It is your intention to take a much longer trip this time, than usual. And you may be located where you do not have access to sporting goods houses where all of your wants can be filled. In fact, even the best of us are often in doubt when it comes to knowing **where** to get the **thing** we want at the **right** price. You wish you had a friend at your elbow to suggest.
3. **Our** experts are right at your elbow. It does not cost you a penny (except your postage) to take advantage of their knowledge. They know **where** to **buy** and **how.** It is their business—and your advantage.
4. Glance carefully over our advertising columns. If you don't see what you want, write in to our Information Department. You will receive a full detailed reply—post haste—we're always on the job.

Isn't this worth while, if for no other reason than to get the **right** information on **how** to reach your destination by the quickest and surest routes—what railroads or steamship lines to take?

Don't put this off. Co-operate with us by telling your relatives and friends, what we can do for them.

Keep posted. Write to

Life and Sport in Labrador

NAPOLEON A. COMEAU.

In "Life and Sport on the North Shore of the Lower St. Lawrence and Gulf," Mr. Comeau has made a valuable addition to the literature of rod and rifle—and more. It is a book of engrossing personal interest to the sportsman or general reader, and of rare value to the student of wild life.

The author describes the events and experiences of fifty years, spent in the cause of humanity and science in one of the most interesting and least known sections of Canada. He writes as one sportsman to his fellows, detailing his experiences with the wild things of wood, shore and sea, with plenty of stirring experiences with big game and gamy fish.

Illustrated, 450 pages. Paper. Postpaid, $2.50.

FOREST AND STREAM PUBLISHING CO.

GOVERNMENT INTRODUCES ANTELOPE INTO OKLAHOMA.

WASHINGTON, Feb. 1.—Game Warden Rush, of the Wichita Game Refuge in the State of Oklahoma, has informed the Department of Agriculture of the receipt in good condition of eight head of antelope, which came from the National herd in the Yellowstone Park. Through the generosity of members of the Boone and Crockett Club, of New York, funds were furnished for capturing and transporting these animals from Wyoming to Oklahoma. The news of the arrival of the antelope at their destination has been received with satisfaction by the Department officials, who are much interested in the attempt to preserve this interesting game animal.

The pronghorned antelope, formerly existing by thousands on our open Western plains, has now been so reduced in numbers that its absolute extinction is certain in the very near future unless protection is given to the few remaining. It does not do well east of the Mississippi River, and cannot be successfully bred in captivity; but it thrives under conditions closely approaching the natural ones.

In 1908 the Biological Survey estimated that the total number of antelope in the United States had been reduced to 17,000. Of these about 10,000 were in Montana, Wyoming and the Yellowstone National Park, and the remaining 7,000 were distributed in 12 other States.

On the Wichita Game Refuge it is hoped that the antelope will find themselves in surroundings suited to their increase. The Wichita is really a National forest, and Game Warden Rush acts as its supervisor and attends to all the business involved in its administration. But on the Wichita, which was set aside by Act of Congress as a National Game Refuge because of its especial suitability as a breeding place for the wild creatures of the plains and lower Rocky Mountain regions, the importance of the game work has overshadowed the ordinary uses of a National Forest. There are 150 National forests, but only two National Game Refuges.

This does not mean that outside of these refuges the game in the National forests is not protected, for the National forest officers are uniformly instructed to see that the game laws of the various States are observed in their forests in so far as they can do this in justice to their other duties. Many of the forest officers are regularly appointed deputy State game wardens, and it is the policy of the Department of Agriculture to encourage their acting in this capacity when they can do so without prejudice to their work as forest officers. Ordinarily, game matter pertain to the States, and not to the National Government. The State prescribes when and under what conditions game may be killed.

In the Wichita and the Grand Canyon Game Refuges the Government has not left the matter of caring for game protection wholly to the States, but has established National reservation on which an attempt will be made to breed game. The Wichita is notable for the fact that it has a small herd of buffalo upon it, which the game warden regards as the apple of his eye. They were donated by the American Bison Society and shipped from the New York Zoological Garden in 1908. They then numbered 15, and have since been increased by the addition of 10 calves; two of the original herd, however, died in the first year. To the buffaloes are now added the antelope.

The antelope shipped from Yellowstone Park, and liberated in one of the buffalo yards which had been prepared for them, will be given more and better range as soon as a proper wire enclosure can be made.

All the game laws of the United States and Canada, revised to date and now in force, are given in the Game Laws in Brief. See adv.

Book Exchange.

Advertisements of old books which are out of print, or of second-hand books, for sale, exchange or wanted, will be inserted in FOREST AND STREAM at 13 cents a line, 7 words to the line, 14 lines to the inch.

KENNEL LEDGER

Complete, Compact, Pocket Size.

Specially arranged according to the directions of an experienced kennel manager. Full printed headings for receipts, experience, data, etc. Ruled pages. Memoranda spaces. The most complete and handy small kennel record yet devised. Smooth, heavy paper, 100 pages, 6½×4. Cloth covers.

Postpaid, 80 cents.

FOREST AND STREAM PUBLISHING CO.

HITTING vs. MISSING

By S. T. Hammond ("Shadow"). Cloth. Price, $1.00.

Mr. Hammond enjoys among his field companions the repute of being an unusually good shot, and one who is particularly successful in that most difficult branch of upland shooting, the pursuit of the ruffed grouse, or partridge. This prompted the suggestion that he should write down for others an exposition of the methods by which his skill was acquired. The result is this original manual of "Hitting vs. Missing." We term it original, because, as the chapters will show, the author was self-taught; the expedients and devices adopted and the forms of practice followed were his own. This then may be termed the Hammond of system of shooting; and as it was successful in his own experience, being here set forth simply and intelligently, it will prove not less effective with others.

FOREST AND STREAM PUBLISHING CO.

My Friend The Partridge.

S. T. Hammond. A delightful reminder of crisp autumnal days in the covers. It tells of sport with the noblest of game birds, the habits and habitat of the ruffed grouse, with just the right touch of reminiscence and personal experience. Cloth. Illustrated, 150 pages. Postpaid, $1.00.

The Angler's Workshop

RODMAKING FOR BEGINNERS

By PERRY D. FRAZER

A unique work, bringing the science of rodmaking up to the very moment and epitomizing the knowledge and the experience of experts for the guidance of the average man. The evolution of bait-casting principles has made Mr. Frazer's book supersede all previous publications on the subject.

Every angler—young or old—who is fond of adapting his rods and tackle to his own ideas of what they should be, will find in this book a large fund of information gathered by the author in years of study, experiment and practical experience in fishing, tournament casting and at the work bench. He theorizes and speculates not at all. He tells "the how" of everything connected with rodmaking in a way that makes results certain. All explanations are simple and easily followed.

Separate chapters are devoted to each of a half dozen types of bait-casting rods; to tarpon, surf and light salt water rods; bass and trout, salmon and tournament fly-rods. Complete specifications of well known types are given, and the chapter on split bamboo rodmaking is the most comprehensive treatise on the subject ever published. Indispensable in the angler's library.

Cloth, 180 pages, four full-page illustrations, 60 working drawings, making plain every feature of the text. Postpaid. $1.

—FOREST AND STREAM, Aug. 14, 1873.

TO GET THE BEST WORK.

THE report of Deputy Forest, Fish and Game Commissioner John B. Burnham for the last fiscal year of his term as chief game protector of New York State is full of meat. Mr. Burnham has devoted his energies to building up a force of subordinates whose members should feel in their work as much interest as he did in his. This is the most effective thing he could have done. Many of our game laws are good enough in themselves; the weak spot lies in the failure to enforce them.

The holding of a public office too often seems to take out of the holder all energy and initiative, and to make him absolutely lethargic and inert. An official of this type after a time ceases to feel any interest in his work except that part of it which has to do with drawing his pay. Mr. Burnham has made it his business to drop the inefficient men from the force as fast as possible, and to replace them by others, each of whom he has tried to infuse with his own enthusiasm. One result of this course has been a great increase in the number of cases handled by the protectors, which for the year ending Sept. 30, 1910, numbered, including violations of the fish and game laws and actions for trespass on State lands, 1,534 cases. The amount of penalties recovered was over $58,000. In order to encourage the protectors by giving them a reasonably certain tenure of office, they have been put under the operation of the competitive civil service law.

Beyond this there should be a system of rewards for good work; and these rewards might fitly take the form of progressively increased pay with the years of efficient service, with the prospect that, at the end of twenty years' service, the protector should be retired on half pay. Protectors should understand that if they do not achieve certain results, based on faithful service and cases brought, they will be dropped from the force; but that after a certain period of satisfactory service each man will receive an increased salary, with the retiring privilege above suggested.

The pay of the protector is now $900 per annum. After two years' service each should receive $1,000 and should have an increase of pay every two years after that until the sum reaches $1,200. Any year in which a protector fails to do satisfactory work—even though his work be good enough to justify his retention on the force—should be disregarded in counting the time for an increased salary. The privilege of retirement after twenty years of service should also depend on the work that the protector had done.

Half-hearted—perfunctory—service is an obstacle to much of the work in public office, and in recommending that by means of a system of increased pay and a pension, each protector shall be given an incentive to put into his work the very best that is in him, Mr. Burnham shows that he has a clear idea of what the service most needs. State officials interested in game protection will do well to ponder the recommendations of this report.

GROUNDHOG DAY.

THE outdoor man would think that there was something wrong if the early days of February went by without a reference to the groundhog and his day.

A year or two ago we gave in FOREST AND STREAM a brief account of this superstition and of its origin. Imported from Europe, though adapted to fit an animal of the new world, the saw concerning the groundhog is an article of faith for most Americans.

> If the groundhog sees his shadow in the sun
> Six weeks more of winter will have begun.

The faith in this jingle, however, is largely misplaced. It is painful to be obliged to say it of one of our most familiar wild animals, but the groundhog makes frequent mistakes. Whether his observation for 1911 is or is not accurate only the event can tell, but it is certain that on groundhog day this year on the North Atlantic coast no groundhog had the privilege of seeing his own shadow. Hence—if we place our faith in the rhyme quoted above—winter is ended. To this must be added the fact that along that coast Feb. 4 was ushered in by a violent thunderstorm, another unfailing sign—in the popular belief—that winter is at an end. Three days later came an equally severe snowstorm with bitter cold.

Whether there exists on this broad continent any man who has kept a careful record of successive groundhog days or not, we cannot tell. If such a man exists, it would be interesting to learn the result of his observation.

HAHATONKA PARK.

AMONG the broken hills on the northern slope of the Ozark Mountains in Missouri nestles Hahatonka Park. Once the rendezvous of those tribes of Indians which pursued the deer in the rough country and idled on the placid waters of the cold streams, that section has come to be the vacation ground of the hard workers of Missouri. It is a natural wonderland. The limestone bluffs are honeycombed by caves of all sizes, and great springs gush forth from the rocks, forming brooks and rivers that teem with black bass and wall-eyed pike. The bluffs, for which the region is noted, are of great natural beauty, and the hills above them are mostly scant of soil—stony, clothed with scrub cedar and oak, and unfit for cultivation. In autumn and early winter the air is balmy, hazy and soothing to weary men and women, and the broken hills temper the fury of the storms.

All this the sportsmen of Missouri know, and they propose that Hahatonka be purchased for a park, but in an unusual way. They contribute nearly $150,000 annually to the shooting license fund of the State, and their suggestion that a portion of the fund be devoted to acquiring the eleven thousand-square-mile tract is a novel one. At one time it was the home of great numbers of deer, wild turkeys and quail, and the cold streams contained hordes of game and food fish. With rigid protection the tract would again become a natural game and fish refuge. As the region round about Hahatonka is gradually becoming more accessible, the land values are increasing. No time should be lost in securing the tract if this can be done.

MIGRATORY GAME BIRD PROTECTION.

THE introduction last month in Congress by Representative Weeks of a bill forbidding the spring shooting of migratory game and other birds is an interesting sign of the times. It is now six or eight years since Mr. Shiras introduced in Congress a bill giving the Federal Government the control of migratory birds and fishes and nearly twice as long since the subject was first broached. In all these years nothing has come of this, save a quiet and continued discussion of the subject by the people.

There is no doubt whatever that sportsmen and game protectors everywhere believe that those birds which are not local in habit, but which travel from north to south and again from the south to the north, properly fall under the care of the General Government, and should be protected by it. On the other hand, the conservatism of lawyers and legislators, together with their general lack of interest in and acquaintance with the subject, makes it most difficult to secure any action on the subject, or in fact even to bring about a full discussion of it. Undoubtedly the time is approaching when Congress will take hold of the matter, but the day for action may still be distant.

The sentiment in favor of better protection of our natural things is growing day by day and the education of the public is constantly progressing. This is encouraging. Precisely the same thing took place in connection with the movement toward forest protection about thirty years ago, and we may hope that in the near future laws protecting game and fish and their enforcement will be vastly improved, just as to-day they stand changed and improved over what they were thirty years ago.

THE SPORTSMAN TOURIST

The Grass-Water

The Florida Everglades—A Mystery of Three Centuries

By WILLIAM PERRY BROWN

SOMEWHERE, not many years ago, I came across what seemed to me to be a rare curiosity, a pen-and-ink copy of an old Spanish map of the Peninsula of Florida.

I had lived many years in Florida, and had sailed, fished and hunted from St. Augustine to Key West and up to Tampa and Cedar Keys. I had fraternized with the remnant of Seminoles living in and about the Everglades and the big Lake Okeechobee on their northern edge, but like other white men who live, hunt and trap along that key-lined, lagoon-studded, limestone wilderness border, which forms the coast rim of that interior watery waste, I knew little of the real heart of the Everglades.

One thing about this replica of an ancient map surprised me; and the surprise kept growing when, in memory, I compared it with other maps, many of them modern. This was to see how little in three centuries the maps have changed as regards the southern third—the extremity of Florida. Around portions of the coast and along the northern border, towns had sprung up, some of them growing into cities; railroads had pushed here and there, belting the keys of the east coast to Key West, and forming networks along the Gulf with Tampa as a sort of starting point. But the vast interior, beginning with Okeechobee, and confronting civilization south of that on every hand with an invulnerable wall of high sawgrass and shoal waterways, more infinite and perplexing than the Saharan Desert was for centuries, though in a different way—the Everglades still held their potent and mystic sway, much as they did when they confronted the old explorers, Ponce de Leon, De Soto and others, searching for gold and the fabled fountain of youth.

The old map showed the coast line and general topography with some detail, and indicated certain rivers much as they are indicated to-day. It demonstrated a curious fact; while this Peninsula of Florida was one of the first parts of North America to be accurately mapped four centuries ago, the southern tip of it is one of the last to be intimately explored, at least by white men. The interior of the Everglades is to-day almost as little known as when the early navigators first contoured what they called the Cape of the End of April. The Everglades are happily named; the sunny recesses of such a region should surely be glades of life and beauty, with a promise of almost endless summer. A mere remnant of Indians share its hidden life, thread its mysterious waterways, and have always been at home in the heart of it; but the white man does not follow to any appreciable extent. These Seminoles vanish from his sight as he stands on its brink gazing almost helplessly after them. Why is this so? What is out there under the sunrise or sunset, according as one looks forth from the hummocks, swamps and koomtie-studded scrub of its enveloping rim?

This region—the glades proper—is not exactly land and it is not exactly water. You cannot travel by land, because water interferes, now shallow and again rather deep. You cannot travel freely by water for the land is everywhere there. It is a land of bog and high, close grown, saw-edged grass which, owing to its impassable nature, bars progress by boat and by land. The Indian's ability to penetrate this labyrinth is surely a very remarkable thing. Some key the Seminole undoubtedly has to the mysterious paths, for he crosses the Grass-water at will in four days. When the water is high he can pole his dugout canoe from Fort Lauderdale or Miami, across the sawgrass waste to the edge of the Big Cypress Swamp.

How is it that he slips through so easily where the white men—old hunters, trappers, so-called guides and the like—find the way barred? The red man will not tell his secret. For years, since the old Seminole wars, when white soldiers drove them into this, his last refuge, he has exercised his mystic knowledge for his own use and behoof alone. Though the exigencies and stress of war finally drove most of the tribe to a surrender that meant expatriation, the remnant still lingering have kept the Glades mainly to themselves, regarding the sporadic efforts of the all conquering paleface to do what the Seminole does when he wants to, with the silent tolerance that marks his behavior toward that which he despises yet cannot help. Consequent upon all these hindrances, what we have learned about the Everglades during three centuries has been learned in fragments.

Various schemes have been devised for a vast drainage system, more or less of which either has been or is being executed in a more or less comprehensive manner. It is recognized that the Glades, once thoroughly drained, would be of great agricultural value; and if the water was once withdrawn and kept out, the battle with so far unconquerable sawgrass would become comparatively simple and easy. There are good physiographic reasons for believing it to be feasible to drain them, or at least parts of them. Eventually this huge Nature fortress that has so long resisted the white man's assault, will be taken by siege.

Aside from the practical aspects, the mystery of the Glades is always fascinating. What is out there under the pale, rose gray or torpid blue of the semi-tropic sky? This mystery is part of our historical inheritance. Early geography captivated our fancy in telling vaguely yet alluringly of this water-wild. It had its place among the country's wonders like Niagara, the Yosemite, the Grand Cañon, the Natural Bridge and so on. All these others have been explored in various ways, but the Glades still elude us as partially unknown. Here the old discoverer's charm is still potent; for much of the Glades is still marked on the late maps as "unexplored." Even the North Pole can hardly boast its mystery in that way now.

The various attempts by white men to search the mystery of the Glades, form a singular series of disconnected episodes. The first recorded one to enter the silent country of the Grass-water, was Escalente de Fontenada, who, shipwrecked in the Florida Strait, became the captive of a cacique named Calos. By reason of ruling over all the Indians in that region he was called, said the Spaniard, "Lord of the Everglade." By the Calos Indians that whole region was named Lake Mayaimi, a name that still persists in the designation of Miami River. Fontenada told a few brief, meager tales of his experiences during fifteen years of mild slavery among these savages. Like most adventurers of that era, he was after gold and the rejuvenating spring that would renew his youth. No gold did he get; and though he bathed in every spring he came across, his youth did not come back and old age eventually sent him to the grave.

After this for a century or two the whole region was unvisited so far as tradition records. Then the Seminoles, the cast-off vagabond of the Creeks, found the Pah-hay-o-kee (Grass-water), a safe and silent abode, and settled in the Glades, moving from island to island through pathless waterways that left no trail, while the high, bristling sawgrass stood guard about them always. After that came difficulties with the white men, and during these came sundry active efforts by the military forces pursuing the Indians to explore the watery waste in which, after their various forays against the paleface, these Seminoles always vanished.

From 1840 to 1857 frequent incursions by detachments of the regular army under competent officers were made. But they were mainly looking for Seminoles rather than seeking to extend our geographical knowledge. Nevertheless, the reports and sketch-maps, having been preserved, present curious information. Captain Dawson, in 1855, with sixty-three non-commissioned officers and men, with the help of a half-breed guide, started from the eastern side of the Glades. When waterleads failed the boats were forced along by poling, wading and pushing. Often the grass was cut away in front and the men were more or less cut by the sharp-toothed edges of the blades. Progress grew slower each day. Long detours had to be made to avoid the heaviest grass belts. The low water added to their difficulties; they had to sleep at night in the canoes. Finally, the grass barrier growing denser, Dawson had to turn back. The utmost point reached was four miles east of Prophet's Landing, a spot near the western edge of the Glades. The log of the journey shows that while traveling 120 miles by trail, the direct distance accomplished was a trifle over fifty miles.

Prior to this Buckingham Smith, with a detachment under a naval lieutenant, entered the Glades by the south fork of the Miami River, in September, 1847, when the water was high. With a light bateau of only five-inch draft they succeeded in going westward two days. Then the heavy grass growth caused them to change their course to north-northwest. Five days later they reached Prophet's Island, somewhat east of Prophet's Landing. This was not far from the point afterward gained by Dawson. The Smith party saw that, owing to the density of the sawgrass, further progress was impracticable, even with the advantage of high water. But Mr. Smith explored many islands large and small in the Glades, finding on some broken pottery and many bones, but nothing to indicate that the early inhabitants were other than Indians. Leaving Prophet's Island on Sept. 17, they succeeded in reaching Fort Dallas, now Miami City, late the next day, having returned by the route they had broken through before. In recent years other expeditions have been attempted.

In 1883 Major A. P. Williams, who had already undertaken expeditions in Southern Florida, was sent by the New Orleans Times-Democrat to explore the Everglades. Besides several white men, the party included six negro oarsmen. Starting from Punta Rassa on the west coast on Oct. 21, they set out up the Caloosahatchee River, reaching Lake Okeechobee on Nov. 1. They had two large canoes, one or more smaller ones, and carried supplies for sixty days. Coasting the southern shore of the lake for three days, they selected a likely opening into the Glades, and on Nov. 10 left the lake, but without a guide, it appeared. For several days they laboriously struggled through a dense tangle of sawgrass, scrub willow, wild myrtle and custard apple, and on the 15th they came upon the sawgrass proper. They set fire to the grass, and the water being only four inches deep, literally blazed a trail; still progress was very slow. Few or no islands were seen, but on Nov. 28 deeper water was found, and an island on which they spent two days repairing the boats and in resting. From there they advanced more easily, and on Dec. 6 finally reached the head of Shark River, which they descended to the Gulf. A passing coasting schooner took them back to Punta Rassa, which they reached Dec. 11, fifty-one days after their departure.

On March 21, 1892, another party, headed by J. E. Ingraham, then president of the South Florida railway, entered the Glades at Fort Shackelford, on the extreme western edge, with two cypress skiffs and two canvas boats. They headed southeast, right across the center of the region, under a theory then potent that a plateau of land or a body of open water would be encountered. From five miles a day their progress grew slower until, four days after starting, they had to leave one of the skiffs behind, owing to the constantly increasing density and height of sawgrass. Leaders and hands all worked and tugged alike, often waist deep in water and muck, cutting away the fierce grass to make room for the boats; pushing, shoving, poling. At times portages had to be made across intervening islands. They slept at night, either in the boats, or by piling cut sawgrass on that which was growing. At times they camped on small islands in their route. Provisions were running short; the men began to give out one by one, and they were in actual danger. They dared not go back; the risk was too great. More impedimenta were thrown aside. Distant Indian fires were seen, for they were nearing Miami, and finally they saw an old Seminole who reluctantly agreed to guide an advance party out to the head of the Miami River. Finally, on April 7, all hands, greatly exhausted after their seventeen days' struggles, found themselves at Miami, then much smaller than now. This expedition demonstrated that there is no open water or large plateau in the interior of the Glades.

In 1897 Lieutenant Willoughby, of the Naval Reserve, entered the Glades by the River Harney, northwest of Cape Sable and near the Shark River, where Major Williams came out. Willoughby had only one man and each had a light, portable canoe. With two months' provisions they started northeastward, poling, pushing, cutting the sawgrass and camping at night on tiny islets that were often oozy with water. After six days they found they could not penetrate the heavy sawgrass east of them, and retraced their steps until a course was found around the southern edge of this unconquerable expanse of Grasswater. After a toilsome trip of fifteen days they succeeded in reaching Miami.

All these expeditions showed the insuperable obstacles confronting the white man in that uncharted plain of shallow water and barbed-wire grass, devoid of intelligible landmarks and in large areas totally impenetrable. Even the islands all looked very much alike, except in point of size, and instead of helpful guides were so numerous as to be confusing. Also the infinitely tortuous movement of water in the Glades was confusing. The oozy, miry bottom, now a fathom or more deep and again but a few inches, and the ever present peril from moccasins and other venomous water snakes was trying. All who ventured into this pathless grass sea had emerged only after incessant toil, hardship and real risk of life.

WHO'S AFRAID?

Photograph by Perry D. Frazer.

Since then a few tentative trips have been made from various points, but none has materially added to our knowledge. It is generally conceded that all this Southern water-wild is a vast though shallow depression, underlaid and rimmed with limestone formations. Time has covered it with a mantle of sand, on which the detrition of ages has produced a soil alternately dry or water-bogged. This was added to by the constant rotting of vegetation for perhaps thousands of years. Countless lakes and potholes are scattered over the area, culminating in Okeechobee and the lake country northward; and in the south in the shallower waters wherein the sawgrass and low, island hummocks have covered the surface though not obliterating the nature of the watery foundation, so to speak. The area of this southermost part, including the Glades, is probably forty leagues from north to south and from twenty to twenty-five east and west. Around this basin is a coastal rim of

limestone overlaid with sandy soil and a vegetation ranging from poor palmetto and oak scrub, to the rank growth of semi-tropic swamp or bottomland. This rim is from three to twelve miles from the ocean edge of the coastal plain on the east; and on the west an average distance of forty to fifty miles from the Gulf. So far as explored it extends all round the edge of the central basin, forming a great saucer-like depression that dips slightly on the north toward Lake Okeechobee.

The rock bottom of the basin that forms the Glades is as uninterrupted as its rim. Wherever one can reach it with a pole or paddle under the muck and mire overlaying it, the sound is unmistakably that of solid rock bottom, varying from a foot to ten or twelve feet in places, but with a general depth of from four to six feet beneath the surface. Over all this is a layer of muck, the depth of which depends on the depth of the rock floor underneath. In the muck the sawgrass grows rank, to ten feet in height. Unnumbered springs fill this vast basin with water, finding outlet not only in the big lake northward but from numerous small rivers, like the Caloosahatchie, Chitahatchie, Harney, Shark, on the Gulf coast, and the Miami, New, and a few other small streams on the east coast.

This great lake, including Okeechobee and other smaller lakes outside the Glades proper, all formed the ancient Lake Mayaimi of the old Calos Indians. It is not, as many suppose, a mere swamp or marsh, nor a pool of stagnant water, but a veritable lake. The water is ever moving, yet no water shed drains into it, nor any stream, for the water courses all flow from it. From two sources is this overabundant supply of water derived; from precipitation and from subterranean overflow. During the rainy season the precipitation is often ten inches a month, but in that warm zone, the evaporation is also tremendous. Therefore, precipitation can account for only a small percentage of the clear limpid water which fills the Glades. A geologist, however, would soon determine the nature of the main supply. The Eocene limestone that is the final substrata of this region abounds in springs and hidden, underground streams, and is so permanent a source of subterranean reservoirs that wherever artesian wells have been sunk along the coast, an abundant volume of fresh water responds, even at the very edge of the sea itself.

One explorer tells of a mammoth spring from which, he declared, "all these Glades" might be supplied. Others observed "many large basins through which currents converged and into which the waters were lost." The effect of precipitation is shown in the rapid rise of water there, but the effect of underground supply is evident in the constant volume of water fresh, undefiled, clear, and though warmish at times, always palatable. One singular condition is that the water moves, apparently in one mass, with a general trend toward the outlets into the ocean. At the same time currents and counter-currents are constantly met. These are doubtless caused by openings in the rocky floor underneath the muck layers through which the waters seep, finding egress underground to various flowing springs along the coast. These currents begin, seemingly without reason, and certainly lead nowhere in particular, ending usually in a surface still pool, where the sawgrass bars further progress.

Scattered along the eastern and western edges of the Glades are uncounted islands, usually based on outcropping of the rock strata, which are covered by a rich, dark mould. They vary in size, some having a dry, cultivable area of several hundred acres. The alluvial islands that are intermingled with these are wet, but the outcrop islands are habitable, and respond gencrously to the scratchy methods of the Seminoles, producing with very little labor all the temperate and sub-tropic fruits and vegetable products. Of late the whites are invading these islands with more thorough methods and the results are astonishing. Naturally, these islands in the Glades are covered with luxuriant forests of live-oak, bay, magnolia, cabbage palm, wild rubber, custard apple, and the ever present koontie or wild arrowroot. This last is one of the mainstays of the Seminole. From its roots he extracts flour and starch, both digestible and appetizing. There are orchids in large numbers and of great variety and beauty. On many islands grow giant ferns, the fronds of which often reach nine or ten feet in length. Cocoa plums grow all about the edges of the Glades, producing both blue and white fruit according to species and location.

Wild animal life is fairly abundant in and about the Glades, especially where the larger islands lay. Deer are found around the edges, and in the alluvial, swampy parts bears are not infrequent. The panther has not disappeared here, as it has from places less akin to civilization. Otters are plentiful; also the alligator, now much depleted elesewhere in Florida.

Bird life has suffered much at the hands of the vandal plume hunter, though later laws and their more rigid enforcement have operated favorably. This region was once a favorite breeding place for the egret, ibis, heron, white and pink curlew, and the pelican. Along the edges was this especially so. The limpkin, (resembling an overgrown snipe) a large duck, not unlike the brant, and the Glade kite, are all peculiar to this region. Along the salt water coast bayous, of course, many other species either migrate here each season or remain permanently, but they are not more indigenous to the Glades than to many other climatic localities.

Many kinds of fish inhabit the fresh water—bass, perch, gar and other well-known species. The Glade terrapin and flat soft-shelled turtles, both edible, are plentiful. On the larger islands and in the Big Cypress on the west side the wild turkey is yet in evidence, often so tame and unsuspicious as to make the hunter feel mean, as one taking undue advantage might feel. Snakes are too plentiful—rattlers, moccasins, hoopsnakes, coach-whips and so on abound so that one wonders how the Indians, habitually bare-limbed from knee to foot, escape being bitten. The Seminole, however, possesses an antidote in some simple weed, known to but few outside of the tribe.

One would think that insect life would be very abundant in the Glades, but this is true only as to certain localities. Free from stagnation as is the water, everywhere so abundant, it furnishes few breeding places in the Glades proper, but on many of the islands, and on the east and west margins, owing to contiguous swamps and luxuriant foliage, there are many mosquitoes, sandflies and other pests. Gnats, small flies and the ubiquitous flea soon find out one's camp in these locations. The Indians do not seem to mind them. When they accepted a moiety of civilization in the form of the domestic hog, the flea attached itself, and both savage and pig wallow fraternally in the same quarters; the hog below on the ground, the Indian a foot or two over the hog on the first and only floor of his palmetto-thatched house.

This remnant of the Seminoles is unquestionably the most interesting of the occupants of the Everglades. We thrill yet at thinking of old Osceola and his long fight against the paleface. This offshoot of the great Greek tribe of the mid-South made its way to the Florida wilderness, and there dwelling in quiet until summoned by our Government to give up their refuge and go west, defied the summons and boldly giving battle, baffled all the military forces of the United States for years. Their stronghold was the Everglades that welcomed the naked red man and barred out his armed white opponent. But for these watery solitudes, the Florida war would have been an easy, brief affair. The relentless sawgrass wore out the baffled soldiers, while it sheltered the Seminole, secure in his knowledge of its secret tortuous water paths. And the Everglades are still the Indians' home. The stubborn remnant that remained after the main body of the tribe was deported west has long been tolerated by the State authorities, while the Indian Bureau at Washington pretends not to know of them. Surely they have earned their right to be let alone. Where they live in the scattered islands in the sawgrass no one else would care to live—at least not yet.

All told they number less than 500 and are of two main families, the Muskokis and the Mikasukis. They live by hunting and fishing, while their women cultivate patches of maize, sweet potatoes and other simple crops on the islands where their little villages are. The houses are merely palmetto-roofed huts of six poles, set upright in the ground with a platform about three feet high. The family live, eat and sleep on the platform, and underneath the pigs, chickens and dogs indiscriminately wallow, roost and disseminate filth and fleas.

When the water is low, the Glades resemble far-reaching prairies, with here and there distant clumps of forest, outlining islands. When the water is high it is not prominently seen, for the sawgrass hides all, save the multitudinous network of channels leading seemingly everywhere, yet in reality nowhere, save to these Indians who know it as a man does the streets of his home town. As for the climate of the Glades, all unite in declaring it to be nearly faultless. It is equable, showing no extremes of heat and cold, nor is it subject to sudden change. The winter northers coming from regions of snow and ice are softened to milder temperature when they reach the Glades. The heat of summer is made genial by the winds that sweep across from the nearby ocean on every side but the north. Here they strike Lake Okeechobee, a veritable inland sea that still further tempers the climate of the Glades which are south of the lake.

There is, roughly speaking, a dry and a wet season, the last continuing from June to September, inclusive. Yet at any time variable showers may occur, often accompanied by thunder and

lightning. In the autumn great humidity is apparent. In the Glades there is practically no malaria. The winter is mainly dry, though an occasional rain storm may sweep in from either ocean. The only real climatic drawback to the Glades is one that pertains to the whole peninsula, and in fact to the whole south Atlantic and Gulf coast region. This is the occasional passage of a Caribbean or West Indian cyclone on its way northward. But these visitations are few and far between. Even the Seminole philosophically shelters himself and family in the thick scrub and placidly rebuilds his camp, saying, if he says anything, "Kill out fleas; clean out camp; roof leaky, anyhow," or Seminole words to that effect. The Seminole is not a talkative individual—among the whites.

The approaches to the Everglades are strangely beautiful. In the dry season when the waters are low, one can enter some distance on foot or by horse, but the usual approach is by motor boat or the silent dugout cypress canoe of the natives. These Glade rivers often run through rocky channels, cut by age-old currents to the sea. They meander here and there amid a riot of sub-tropical growth. Here reigns the mangrove, with its spidery legs seeking a watery foothold until acres are covered by their dense, singular agglomeration, with no land visible whatever. Nearer the Glades where the fresh water overcomes the brackish tidal water, the cocoa plum becomes prevalent, and further still the cypress, buttressed with mighty knees, fills the shore line. Wild vines of many kinds, lilies and other gorgeous water plants fairly riot everywhere. Then—at the edge—the river opens out into a vast expanse of wind-swept green and gold. The prairie-like surface of the Glades, the Grass-water, the source of the river's supply, is before the eye.

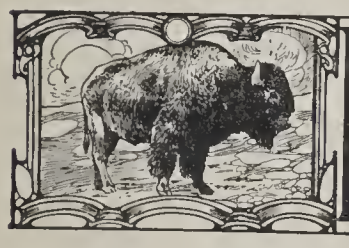
"Caloosa's Lake of the Sweet Water" was one of its Indian names. Neither hunter nor tourist cares to penetrate its mysteries far. One may watch the tall sea of grass wave over a glistening field of watery silver, undisturbed by the trail of the explorer. He will perhaps see the nearby canoe, an Indian poling, his turbaned head and bare legs conspicuous, while his wife and pickaninnies curl up in the bottom beside the merchandise for which they have bartered skins, furs, venison and other wares at the nearest trading store or town. He will most likely watch that canoe turn into one of the nearer waterways and vanish behind the sawgrass. When it returns no more he may wonder where it has gone, and why, when he tries to do likewise, he invariably gets tired out and probably lost.

He may ask some of the Indians at Miami or Laudervale to pilot him into the Glades where the Seminoles live. Oh, yes. "Incah!" Surely. No trouble at all, or intimations to that effect, especially if he offers to pay well. But, invariably these Indian-piloted excursions seem to come out nowhere in particular. The tourist has merely skirted the edge of whatever part of the Glades he tries the game. The hunter, the old settler, makes no such breaks. He knows it is not worth while. Very seldom, if one be an old friend, much trusted by the tribe, one may be taken to a Seminole's real home. But after one has returned to the coast he probably feels that he has been somewhere, has lost the direction and could not return if he would.

Lastly comes the theory of geology regarding this strange region. The Glades, Lake Okeechobee, and the entire southern half of the peninsula are said to be the shallow bed of a long extinct volcanic crater. The silent revolution of the unnumbered ages has gradually wrought the present state of affairs in nature out of the past. Tell a Seminole of this and he will look at you with the inscrutable scorn of those who neither know nor wish to know what the paleface calls the truth.

"Grass-water here always," perhaps he will say. "Always—for Injun."

And so at present he seems to have the best of it, but for the future—who knows?



NATURAL HISTORY

Feeding Habits of Coots and Ducks.

In Northern Indiana. in Michigan, Wisconsin and Minnesota, and in many other Northern States are thousands of small glacial lakes. They are the finest lakes in the world for fishes of many species. They are equally remarkable for aquatic plants—marvelous in their abundance, not only as to individuals but as to variety of species.

To any one interested in the study of the animals and plants of a region no better unit could be selected than one of these beautiful lakes. The number of problems that it would present for study is almost infinite, many of them of the greatest interest. For example, what can be more fascinating than observing the water-birds seen on such a lake?

In the spring many species of ducks and other water-birds visit these lakes where they tarry for a few days and go on farther north to their breeding grounds. A few, such as the great bittern, least bittern, mallard and wood duck, may remain to breed, but the vast majority pass on northward. In the late summer and early fall they begin to return, bringing with them the young of the year, thereby greatly increasing the number of migrating birds. Then is the time to watch them and learn their habits, for they are sure to be present by hundreds or even thousands, and to remain for several weeks.

It has been my good fortune to sojourn many weeks and at different times at Lake Maxinkuckee. I have been there during the spring migrations; also throughout the summer and again in the fall and winter, and many pleasant hours were spent studying the ways of the water birds. Nearly thirty different kinds of aquatic birds came to that lake—ducks, geese, swan, coot, bitterns and the like.

Of all these, the most abundant is the coot, followed by the little bluebill, redhead, butterball, mallards, canvasbacks, whistler and ruddy duck. The first to arrive in the fall are the coots, and then a few helldivers and horned grebes appear. Then the two species of bluebill, the mallard, the whistlers and the ruddy ducks come; and still later the redheads and canvasbacks, and the fish ducks.

Early in September the coots come in great numbers, and are very soon found in all parts of the lake. A few are seen in August, but the first large lot came on Sept. 22 in 1899, and also in 1900. That portion of the lake immediately in front of my cottage was one of their favorite feeding grounds, and I had exceptionally good opportunities for observing them daily, or even hourly, from the time they came up to October 18, in 1899, and up to December 11, of 1900.

During my observations in 1899, it had not occurred to me that anything new or of importance could be learned regarding the habits of this well-known bird, and my observations were made and recorded chiefly and simply as a matter of personal pleasure and knowledge. But when I returned home in the fall and began looking through the bird books to see how my observations tallied with those of others, I was surprised to find, in the first place, how little has really been recorded, and in the second place, that much that has been recorded does not at all agree with my own observations.

I became particularly interested in what was said in the books regarding the flying, diving and feeding of the coot, and the character of its flesh as an article of food.

According to one author, "if pursued the coot can run very fast and swim and dive very well; and, if in danger, with great rapidity." Dr. Cooper says, "Being but rarely shot at by hunters, it is remarkably tame, collecting in flocks of hundreds in the marshes about San Francisco and other cities, as well as near remote mountain lakes, walking awkwardly about on their shores, and scarcely getting out of the way to escape the sportsman, who thinks it an unworthy object of his skill, as its flesh is dark and unpalatable. The young bird, however, is said to be good eating." In other places he says, "the coot can swim and dive with great ease." "In such situations it spends most of its time feeding on grasshoppers, leaves of aquatic plants, small shells and insects, collecting much of its food under water."

Still another author who observed this bird in Florida, states that Audubon was in error in supposing that it never dives. He says it is

not in the habit of immersing its entire body, yet he has occasionally seen one or two birds in a squad of four or five plunge and remain so long beneath the surface that this had become smooth before they emerged. "This is frequently done by one individual while the others by its side are engaged in picking from the surface."

John Bartram, in a letter to Alexander Wilson, says, "It swims remarkably well, and when wounded will dive like a duck. They are loquacious and noisy, talking to one another night and day, and constantly on the water, the broad lobated membranes on their toes enabling them to swim and dive like ducks." Wilson further says that "Buffon describes the mode of shooting coots in France, particularly in Lorraine, on the great pools of Tiancourt and of Indre; hence we are led to suppose that they are esteemed as an article of food. But with us who are enabled by the abundance and variety of game to indulge in greater luxuries in that season when our coots visit us, they are considered as of no account, and are seldom eaten."

Dr. Coues says, "I do not recollect when, if ever, I have seen coots fly up into the air and away. * * * As an article of food they may take fair rank, t' ough they are considered on the whole as inferior to most ducks." He says nothing about their food or their diving.

Maynard says, "They not only swim and dive well, but make their way through the grass with ease and swiftness." Wheaton says, "It is more aquatic in its habits than the others of its family, being better adapted for swimming and diving than for locomotion on land. They are considered a nuisance by sportsmen and a fraud by amateurs, who sometimes mistake them for ducks."

Nuttall says, "They are nocturnal in their habits, the old birds being rarely seen by day. * * * With us they are very taciturn, though tame, and appear to have no voice but for the exciting period of the nuptial season. * * * They swim and dive with the utmost facility. * * * They are habitual divers. * * * They do not appear to dive with the same promptness as the European species."

Some of these statements are entirely at variance with my observations.

At Lake Maxinkuckee the coot is as thoroughly a water bird as any species of duck. I never saw them walking on shore as mentioned by Cooper, but observed that they might be found in any and all parts of the lake, though they were more apt to occur in large numbers nearer shore than most other species. I think the helldivers and horned grebes came, as a rule, somewhat nearer shore than the coots; and small flocks of butterballs and whistlers and solitary ruddy ducks were also disposed to stay quite near shore. Bluebills (both large and small) were usually a little further from shore than the coots, while the redheads, mallards and canvasbacks were still further out. However, it often happened that nearly or quite all of these species would be mixed together in a single flock, the coots and bluebills constituting the shore side of the miscellaneous group.

When the coots first arrived in numbers in the fall, they were not wild and came nearer shore than they did later, after they had been hunted. One of their favorite feeding grounds was in front of my cottage, where, if not disturbed, they remained day and night; and as we were careful to disturb them as little as possible, they were usually there in considerable numbers until that part of the lake froze over, which occurred about the middle of December. They never left except when disturbed by some one, or when that part of the lake was made rough by winds, when they would fly to some protected corner of the lake.

The depth of the water in this locality varied from four to twenty-five feet, and the bottom everywhere was well covered with various species of *Potamogeton*, *Myriophyllum*, *Tolypella*, *Vallisneria*, and perhaps others. The *Chara* and *Nitella* grew in the more shallow water, and *Tolypella* in the deepest, while the tape grass or wild celery (*Vallisneria spiralis*) grew at all depths from four up to twenty-two feet.

Barton Warren Evermann.

[To be concluded.]

Curled Tooth.

In "Gnawed Horns," published in Forest and Stream, Sept. 24, mention is made of the curious deformity occasioned by the accidental loss of an incisor tooth in gnawing animals

WOODCHUCK WITH CURLED TOOTH.
Photograph by E. E. Tolles.

when "the opposing tooth, not receiving any wear, and not being worn down, keeps on growing, curls about within the mouth, and perhaps penetrates the flesh or skull of the owner." This is not a reproduction of a degenerate Machairodus, but the photograph of a woodchuck's head, showing a fine specimen of curled tooth. The head has reposed among my curios for several years, and I was unable to account for the deformity until I read your article. Will W. Christman.

American Conservation.

The new illustrated monthly magazine of the National Conservation Association, whose editorial policy will be conducted by Gifford Pinchot, president of the association, will make its first appearance next week. The first number will give special attention to the natural resources of Alaska. The Alaskan article is by James Wickersham, delegate in Congress from Alaska, who writes of "Alaska, a Land of Opportunity." The article will be illustrated by many Alaskan pictures never printed before.

Robert G. Valentine, Commissioner of Indian Affairs, discusses the Indian from an entirely new viewpoint. Accompanying Mr. Valentine's article will appear for the first time in any magazine some of the celebrated Indian pictures by Throssel, the half-breed Indian artist.

Dr. Joseph A. Holmes, director of the new National Bureau of Mines, tells of how his squads of life savers and "mine divers" rescue men in underground disasters, and of the plans to reduce the loss of lives in mines.

In the "High Cost of Hauling," Logan W. Page, director of the Government Office of Good Roads, tells why it costs the farmer more to haul a bushel of wheat from his farm to the market than it does to transport that bushel of wheat from New York to Liverpool.

The editorials, most of which will be from the pen of Mr. Pinchot, will discuss current conservation issues.

Pheasant-Bantam Hybrid.

In the last number of the American Breeders Magazine is described by H. J. Wheeler, of Kingston, R. I., a pheasant-bantam hybrid. The specimen partakes of the characters of both parents, but is of large size, weighing three pounds three ounces, while the father weighed two pounds ten ounces, and the mother one pound fourteen ounces. During the first few weeks of its life the hybrid resembled the chicks of the ring-necked pheasant, but as it grew older it lost some of this resemblance.

Hybrids in which the pheasant has a part are not very unusual, and in the recently published "American Game Bird Shooting" is a figure of a hybrid between a pheasant and the dusky grouse. Such cross-bred birds have a certain interest as curiosities, but nothing more.

That Long Island Flamingo.

Floral Park, N. Y., Feb. 3.—*Editor Forest and Stream:* I notice in this week's issue of Forest and Stream an item entitled, "Flamingo on Long Island." I have to say that about the middle of November a young man at Centreport, on the Long Island Sound, caught alive a flamingo which had flown against a telephone wire and fallen exhausted in the snow. He kept the bird alive for about three weeks in a cage, when it died. The skin is now in my possession. It was a young male, just beginning to develop color. John Lewis Childs.

Buffalo for Topeka.

Joshua Hill, of Pontiac, Mich., has given seven buffalo to the city of Topeka, Kan., and these were transported safely by rail and wagon under the care of expert cowboys, to Gage Park, in Topeka, where they are now, apparently in good condition and contented with their surroundings.

For a Derby Eland.

F. C. Selous, the well-known African hunter, has been commissioned by the British Natural History Museum to go to Africa and secure a specimen of the Derby eland. This animal has been known to naturalists and big game hunters for some time, but no complete specimen has yet reached England. The Derby eland is found on some of the Nile tributaries where Mr. Selous will go to look for it.

GAME BAG AND GUN

A Camp Hunt.

Though we spoke of it as a deer hunt from the time the idea was first mentioned by our president, it turned out to be any kind of a hunt from a deer to a rattlesnake. It might have been designated an ideal hunt, for the weather man managed the elements to perfection, giving us a gentle sprinkle of rain at night and a bright sun ready to smile upon us as we rose next morning. And then our party of sixteen jolly men fresh from the depths of Philadelphia city life, most of them tenderfeet, could not be surpassed anywhere for congeniality. Last, but by no means least, was the abundance of game. It looked as if the entire wild population of several counties and surrounding swamps were holding a reception in our honor.

I, being a hunter of many years experience in this locality, was looked upon as general manager, so went in ahead of the party to supervise the pitching of tents, the laying in of supplies, etc. The entire company was expected on Sunday, so Saturday was my day to put all things in readiness.

The very sight of our wagons loaded with tents and supplies was enough to raise our spirits. As we made our way through shady woodlands and over sunny slopes, our dogs darted forward and hurried back to meet us as is their wont.

Suddenly a picture, dear to the heart of a sportsman, appeared; the dogs rigidly pointing what we thought might be a covey of birds. I stepped softly aside to investigate and to my surprise found a rattlesnake in his coil making the sound that, once heard can never be forgotten. The eldest man of the party, whom we afterward called "Pop," claimed him as his prey.

Darkness found us established, though our commissary tent had not yet been pitched. Anyway we wore the kind of smiles that won't come off and carried appetites that clamored loudly for attention.

Picture if you please a cook stove in the open air, a fire crackling merrily on the inside and sending flames skyward through the short pipe. Behold a big fellow wielding a knife; see the ham drop into thin, even slices; sniff the air as the odor of frying meat penetrates your being; catch the aroma of good coffee, as it blends with the odor of the sputtering meat. We counted ourselves fortunate in having two boards for a table upon which to spread our feast.

On the following day the remainder of our party arrived. It goes without saying that waiting for the dawn of Monday morning was accompanied by great restlessness. In fact everybody suffered untold anguish from the very length of that memorable Sunday night.

By daybreak everybody was in tip-top shape and armed to the teeth. Some carried a shotgun in one hand, a rifle in the other and strung around their waists were samples of different kinds of knives and pistols. When all were ready for departure I took up my .30-30 rifle and strolled out behind that crowd of armed men. I was looked at in astonishment and one asked me in wide-eyed wonder if that was all I was going to take. I said, "Yes, I need nothing more unless it be a hole to hide in with so many of your kind scattered throughout the woods."

The dogs were fired with ambitions to match their masters', and their barking made the woodlands ring. Sousa's Band or the swelling

"POP" AND THE FIVE RATTLESNAKES.

notes from the depths of the pipe organ are but vibrating air compared to the baying of those hounds borne to our listening ears through the pure air of the calmest, sweetest morn to which Eastern North Carolina can give birth.

Enthralled by these sights and sounds, I took my stand by an aged pine tree which had given its life to help furnish mankind with turpentine. I now looked to it in its last days to serve as a shield to protect me in case of reckless shooting. I heard the reports of many guns which brought to mind the glorious Fourth. Casting my eyes rapidly in every direction, I suddenly beheld a big four point buck near Pop's stand. Not understanding why Pop had not fired, and fearing the deer's escape, I dropped to my knee and let my little .30-30 speak. This woke Pop up to the shooting point. It was supposed that he had had an attack of buck fever; anyway the deer turned and crossed a ridge with me in hot pursuit. Another shot brought him to earth. I reached camp first and was quietly resting when the others began to appear, some struggling beneath the weight of deer as I had done. Imagine our elation when six deer hung by their slender legs in front of our tent on the very first morning of our hunt and it barely 10 o'clock. Two of these were killed by our president, they being the first he had ever brought down. His walk after this reminded one of that of a turkey gobbler which had escaped from the holiday dinner table.

Several good-natured disputes arose during the day about who hit and who missed. This and other incidents brought about the necessity for certain rules to be enforced by the following officers:

"Camp General—government, organization and laws, October 30, 1909: President, C. H. Boyer; Secretary of State, Robert R. Dearden, Jr.; Attorney General, William W. Smithers; Chief Justice, Truman A. Wright; Chief Marshal, Joseph H. Brandt; Chief Surgeon and Sanitary Officer, George H. Summers; Board of Guides, F. C. McKay and J. J. Chadwick.

We had two or three sittings of court during the week to punish offenders and protect the guiltless.

The game shot by the gunners included fifteen deer, numerous gray squirrels, four raccoons, a goodly number of duck and quail and five large rattlesnakes. Our taxidermist did some fine work preparing skins, mounting birds, rattlesnakes, etc. Through the physician in the party we learned that rattlesnake oil is a most valuable remedy for deafness, so we extracted a large quantity to take home to our deaf friends and relatives, as it is impossible to obtain it from our druggists at any price.

There were many subjects to be discussed and much to be learned from each other. When at night we hugged our knees around a fire of lightwood knots, the general conversation would be so enlivened by wit, good nature and learning that we saw at once the advantage of having one big tent for dormitory use rather than a number of small ones which would tend to separate the party into smaller groups.

This was not my first experience at sleeping in the woods on a wire cot with the cool breezes of the night circulating beneath it, penetrating to the very marrow of one's bones, so I carried along my sleeping bag which contains a mattress of sufficient thickness to defy that persevering wind. I smiled as I packed mine for the journey, knowing well the others would not be so supplied. I even spoke to my wife about it as I rolled it up.

The first night, when everybody began to get cold and crawl out to kindle fires, I lay perfectly still as far as is possible for one convulsed with laughter.

If one had chanced to look out through the

pine woods the next evening as the shadows were growing long, one might have seen figures here and there busily raking up fragrant pine straw to fill in the space behind cots in the big tent. The task of gathering sufficient pine straw proved too exhausing, so the cots were lowered to meet the need of each special individual or I should have said, to meet the pine straw beneath.

It is impossible to relate more than a few incidents of our fifteen days' hunt. Anyway there came a time when our camp must break up and pass into history as do all earthly events. We did not make a sudden break, but melted away, a few going each day until nothing was left but a worn place on the face of Mother Earth and a pile of lightwood knots unburnt.

Our last day's hunt stood out as prominently for emptiness as did our first day's for marvelous success; in fact we returned lighter than we went out, for our shells had been wasted on the desert air.

Some of our men were so reluctant to leave the scene that had afforded such a wealth of sport that, when the train began to move, they made one desperate dash for it, leaving their baggage behind to be looked after by Tom, Dick and Harry. It appeared in a few days, but soiled and in bad shape, as the packers in their haste to accommodate us had driven nails through some of our best agateware. But never mind, there is more agateware in the stores waiting to go on our camping trip another season.

New Publications.

Lives of the Fur Folk, by M. D. Haviland. Cloth, 234 pages, illustrated, $1.35 net. New York, Longmans, Green & Co.

A series of stories of wild animals and some others, pleasingly told. The style is familiar, though the local color is not, for it is of British foxes, rabbits, badgers, dogs and cats that the author treats. But we all, particularly little folks, never tire of the cute tricks of Reynard, and a truthful record of his life might be stranger than fiction. The pen and ink marginal sketches by E. Caldwell lend charm to the volume.

Auction Bridge Up-to-Date, by W. Dalton. Cloth, 210 pages. New York, Wycil & Co.

A handy manual containing the laws of auction bridge, as framed by a joint committee of the Portland and Bath clubs, and approved and adopted by the former.

Books Received: "The Grand Cañon of Arizona, by George Wharton James; Boston, Little, Brown & Co. "The River and I," by John G. Neihardt; New York, Putnam's. "Fly Leaves From a Fisherman's Diary," by Capt. G. E. Sharp; New York, Longmans, Green & Co. "The American Shotgun," by Charles Askins; New York, Outing Publishing Co. "Twenty Years in the Himalaya," by Major C. Q. Bruce; New York, Longmans, Green & Co. "Under the Roof of the Jungle," by C. L. Bull; Boston, L. C. Page & Co. "With Gun and Guide," by Thomas Martindale; Philadelphia, G. W. Jacobs & Co. "Unexplored Spain," by Abel Chapman and W. J. Buck; New York, Longmans, Green & Co.

The Flight of Wild Geese.

French Lick, Ind., Jan. 29.—*Editor Forest and Stream:* I have just been reading Sandy Griswold's article speculating on the flight of wild geese, and the reason they fly in a V formation. I always assumed the reason to be that this formation seems the very best for the long flights which these heavy birds make in their migrations.

For years I lived in the Red River Valley, in North Dakota, where I had abundant opportunity to speculate on the points as Sandy Griswold speculates on them. It seems certain to me from observations that the leader of the flock not only leads the way but acts as the principal force on the cleaving triangle, and I have seen the leader, apparently worn out, drop back, to be relieved by some other bird from the lines. The leader of the flock being in the front, at the apex of the V, acting as pathmaker through the air, would have the hardest task; hence the changing about in the leading of the flock. It seems much the same as in making trail through the snow on snow shoes, or pace making of any sort. The work of the one in front is the most fatiguing and the logical way is to change about for the sake of resting up.

In flying in a V formation with an adverse wind one side of the triangle would also break the wind for the birds in the other side.

I agree with those who hold to the theory that geese direct their course by the topography of the country, traveling more by sight than by instinct.

Migrating at night and during stormy weather their flight is nearer the earth, so that they may see the land over which they are passing.

But I do not agree that in "heavy fogs and blinding storms" they hold their way with unerring certainty. I have known geese to be so confused by fogs and snow storms as to alight on the ground, which they would not otherwise do, unless on feeding grounds. In cases of heavy storms they might alight on the ground in a pinch to avoid the storm, but since they will often do it in fogs, with no feed near, it seems certain to me that geese do become confused and lose their bearings when they cannot see the lay of the land.

Dixmont.

New York City, Feb. 4.—*Editor Forest and Stream:* Sandy Griswold's comments on the flight of geese interested me, for I, too, while lying in blinds, have often speculated on their wedge-like flight.

One thing which impressed me strongly was the "conversation" between the leader and other members of the wedge, and on listening to this I have often felt convinced that the leader was seeking and one or more of his followers giving advice. I have noticed this time and again and just before the leader changed his course. Knowing the country over which they were flying, and the location of the blinds, I have often, on watching the approach of a flock, made up my mind as to the direction they would take at a certain point, and frequently their actions confirmed my guess. I have been on the sandbars at times when I knew positively no other hunter was within miles of me, yet at such times I have seen geese sheer off and rise after one of these "talks"; then, as if in proof that my presence had nothing to do with their actions, come to my profile decoys and lose one or two of their number to my gun.

When the V formation becomes ragged, as it often does, there is a good deal of scolding from leader and flankers, while the laggard replies with spirit, as though saying he is tired and cannot keep rank. The further he drops behind, the more insistent his clamor for the others to wait for him. A lone goose, flying a mile behind his fellows, is often an easy mark. He always appears to me to have worried over his inability to keep up until he loses most of his natural caution. And a "lost goose," as the Missouri River shooters call a stray, is one of the most foolish of creatures. Frequently, if he flies over your decoys and you pepper him, he will come back from another direction ere long and give you another shot. On one occasion I walked right up to a goose sitting on a sandbar. The setting sun was shining in my eyes and I did not see the stray until it rose, say twenty yards away. That it was uninjured was apparent in its strong flight, but why it did not see me on the wind-swept bar I have never been able to guess.

Apparently the V formation is only maintained in migrating, and, among well-disciplined flocks, in long flights to and from feeding grounds. On the sandbars where geese rest at night, I have seen them make off for the wheat fields in the utmost disorder. Some flocks flew en masse, others in a ragged horizontal line, and still others stringing out in single file, some high, others low, all honking as if in protest. When these flocks rose among the thousands from an isolated sandbar, the individuals come from all parts of the mass, and not as the result of a conference from one part of it. It was as if some individual had said, "Who's going with me for breakfast?" and all who felt like going followed.

As to the V formation, it is seldom perfect. Now and then there will be only three or four geese on one flank and two or three times as many on the other. Anon, the long leg of the triangle will be bent around toward the front, so that many individuals will be flying side by side.

That a goose cannot fly without landmarks to guide it is in my opinion self-evident. One proof is that, if there is anything more foolish than a stray goose, it is a flock of geese in a fog. I have killed geese in a fog, only to have the balance of the flock circle about aimlessly, perhaps come back to be shot at again or alight nearby. In apparent confirmation of this theory there are the spring and fall flights of all sorts of birds, along the Atlantic coast line, with the roaring surf for a guide. There are men who, every spring and fall, take station at certain points, knowing that the flight of hawks will pass within range, and this they do day after day.

On a long snowshoe tramp in the forest there is nothing more monotonous than to see the immediate foreground blotted out by the leader's back. It is a positive joy to take the lead and get the other man behind you, even though breaking trail doubles your work. Why, then, should geese fly one behind the other, when the leader is merely a guide and has no trail to break? In the V formation every individual has a clear view ahead and below, and there is no fouling of wings, as there might be were the formation a horizontal line.

Hints on Hygiene for Sportsmen.

ANY kind of unaccustomed exercise, such as shooting or hunting, is very apt to give rise to disagreeable consequences in the chest cavity, in the direction of fatigue and an often very persistent sensation of muscular ailing. These are consequent upon physical overstrain and lack of training. The first duty of those who aspire to shine in the field is, therefore, to undergo a course of preparation—training.

Physical training of any kind may be summed up in the following propositions:

Every day, short of undue fatigue, undertake a greater amount of exertion than the previous day until one is "in good form," a state that varies according to the individual.

Be able to breathe freely and do so. Never go beyond a quite slight shortness of breath.

Never strain the heart, but let it work in accordance with the ease of breathing.

Avoid kinds of exercise that leave persistent congestion; stop the exercise when the pulse rate exceeds 150 a minute.

Shun all excesses at table, sleepless nights and intellectual overstrain. Remain reasonably continent.

Work on yesterday's nourishment; prepare for immediate effort with the excitomotors of the moment. Never train fasting nor soon after a meal; wait two hours after the principal meal. Never train at night.

Sleep should be regenerative. It ought not to be heavy or restless or troubled. As a general rule, eight hours' sleep is required. Regulate the training by the quality and the amount of sleep. Whenever training spoils the appetite, increases thirst and troubles sleep, it is injurious. What we must aim at is the slight fatigue that braces one up, steering clear of the excessive fatigue that prostrates and upsets.

In short, "we walk with the muscles, run with the lungs, gallop with the heart, keep up with the stomach and we arrive with the brain."

Muscular Training.—When the town dweller on a shooting excursion is obliged to trot over meadows, the anterior leg muscles soon get tired, even when he happens to be a good walker on level ground.

The obligation under which he labors to strongly contract his muscles in order to raise the toes clear of the clods of earth soon tires muscles unaccustomed to this particular form of exertion on the smooth streets of towns.

The effect of continuous exercise of any kind is to strengthen the muscles and to fortify the bones. The slight pains that are experienced in the muscles or tendons after unaccustomed and rather violent exercise are simply due to tiny structural lesions which soon clear up, having undergone quick repair owing to the necessity in which these muscles find themselves to cope with effects to which they are not accustomed. Walking, jumping and running must, therefore, be the object of methodical training on the part of every aspirant sportsman on the general principles formulated above.

Respiratory Training.—Few people know how to breathe properly, yet it is of the utmost importance to the sportsman. He must learn from the outset the immense importance of deep, ample breathing, as far as possible nasal; at any rate in inspiration. This deep, ample breathing is all the more important, seeing that it provides in great measure for the elimination of the waste products produced by effort. It is via the lungs that we get rid of the carbonic acid formed by the combustion of fatty substances, the water resulting from this transformation being eliminated in the urine and even more in the form of sweat.

WAITING FOR A SHOT.
From a photograph by Helen Frazer.

It is consequently easy to understand why stout persons so easily get puffed even on slight exertion. The fatty tissues are disintegrated, the blood is deprived of its oxygen, and as it does not occur to them to breathe in proportion, breathlessness results. Proper training, therefore, soon gets rid of the breathlessness along with the surplus fat.

Education of the Circulation.—The proper working of the heart is intimately associated with that of the lungs. It is hardly necessary to point out that the aspirant sportsman ought to be medically examined beforehand, so that he may cultivate his favorite pastime without fear of harm.

Feeding.—The sportsman should select food substances capable of providing plenty of heat, thus enabling the muscles to withstand sustained effort. The average amount of food required by a healthy man is four ounces of albuminoids, twelve ounces of carbohydrates and three ounces of fat. Now, fats should be banished as far as possible from the dietary of the sportsman, not, indeed, that they do not give off plenty of heat, but their digestion is often rather laborious and they are apt to cause digestive disturbance.

Their assimilation throws on the liver, already fatigued by having to dispose of increased amounts of more virulent toxins than usual, a trying burden. Hydrocarbons are vastly less toxic. On the other hand some of them, sugar in particular, can play the part of a waste preventer and so facilitate great muscular efforts. It follows that advantage attends the use of carbohydrates. Nevertheless, it is not open to question that the sportsman's proper food consists of the various forms of albuminoids—meat, eggs, milk, fish. It is from these that the organism derives its vigor and its power of endurance. It is thanks to them that the sportsman can at a pinch give the necessary fling. The ideal, in view of the drawbacks of a diet too exclusively nitrogenous, would be to temper its rigor by the ingestion of carefully selected carbohydrates which, in small compass, represent a high degree of nutritive power — vegetables, purées, macaroni, puddings, etc. With regard to beverages it is difficult to lay down any hard and fast rules as to quantity. Everyone who has done a hard day's shooting or a long cycle ride is aware that the time comes when the longing for something to drink becomes irresistible, and he is fain to gratify it. Nor would any advantage attend our allowing the organism to dehydrate itself further. The sportsman then will quench his thirst, but he should avoid taking anything except pure water, or very dilute red wine, or weak tea. Bitters, syrups, beer and milk are to be absolutely tabooed.

BETTY WELCH.

New York Legislature.

ALBANY, N. Y., Feb. 6.—*Editor Forest and Stream:* Senator Fiero, of Catskill, has introduced a bill in the Legislature by request amending the forest, fish and game law. It prohibits the taking or disturbing of fish, birds or game on any private park or private lands without permission of the owner of such private land or the owner or person having the exclusive right to hunt or fish in such private park instead of prohibiting such taking after notice as prescribed at present. The bill also provides that game shall not be taken in a public highway or on the lands of a railway or lands purchased or condemned by any municipality within the State for the purpose of supplying such municipality with water and protecting such water from pollution or contamination.

Assemblyman Baumes, of Newburgh, has introduced a bill in relation to the placing of nets and the taking of fish from the Delaware and Hudson rivers and in Catskill Creek.

Assemblyman Waring, of New Paltz, has introduced a bill prohibiting the hunting of rabbits and hares with ferrets, and making the possession of ferrets presumptive evidence of their illegal use.

E. C. C.

Duck Shooting in the Southwest.

Los Angeles, Cal., Feb. 1.—*Editor Forest and Stream:* At last the rains have come, and with them has come an end of a poor season's duck shooting. In Orange county this season the shooting has been injured very greatly by the road hunters.

Duck shooting in Southern California is a preserved proposition and almost essentially artificial. The preserves were once alkali ranches with never a duck near them. The clubs mostly were formed by one or two men who bought up a piece of promising land that lay flat so it could be flowed easily, and organized a club upon it, either selling out their land at a profit, turning it in and taking their pay in stock, or openly making their own interest by taking their commission in that form for making sale and engineering the deal. Whichever way the thing was done, the result was the same. Artesian water is developed, dykes confine it in broad, shallow ponds, and ducks are drawn there in such numbers that the shooting thus created has become with tuna fishing the salient sporting feature of Southern California. Sportsmen from all over the country belong to these clubs and kill two birds with the one stone by coming here to winter in the land of perpetual sunshine amid the wildfowl.

The indictment these men have brought against the road hunter is, he has done nothing to create shooting; is a sporting non-producer, taking unearned profit on the labor and investment of others.

The legislators will be asked to pass a "no sale" law on ducks. The law now extends this protection to nearly all other game birds except the waterfowl. Market hunting is being done less and less each year, and since the new fish commission and the new deputy, John Pease Babcock, took hold of this last fall, the duck bag limit has been enforced against the San Francisco commission men as it never was enforced before. Many arrests have been made, and the illegal traffic in ducks is very nearly broken up.

The closing of the quail season is being advocated quite strongly. Quail are in sore need of protection. The valley variety is typically Californian. It made the reputation of the State in an upland game bird way. It would be a pity to see it perish, and I voice the sentiment of a majority of sportsmen when I say the money now being expended by the State in experimenting with foreign game might much better be devoted to the propagation and protection of the splendid indigenous game bird that we already have. He could not be improved upon; the whole world does not show his equal. The idea of spending the money of the sportsmen upon experiments is abhorrent. It never has been made to pay in half the instances where tried in this country. In Oregon the pheasant did pay, and that instance has been made the cover and excuse for more foolish expenditure of the sportsmen's cash than all other things combined.

The deputies of the fish commission have done some excellent work the last few months, and arrests are being made in a number that if not gratifying, at least proves an effort is being made to enforce the law.

The coming into office of a new governor has made some changes in the complexion of the fish and game commission of which Michael J. Connell, of this city, remains chairman. Dr. David Starr Jordan tendered his resignation, but Governor Johnson in recognition of the sterling worth and standing of the professor reappointed him, reaffirming the judgment of former Governor Gillett. The other commissioner, appointed to succeed Lendal M. Gray, who was killed in an automobile accident at Paso Robles a few weeks ago, is Fred G. Sanborn, of San Francisco, a sportsman well liked and well qualified to make a credit of the office.

Game and fish preservative conditions in California are in better shape now than they ever have been before. Edwin L. Hedderly.

Missouri Fish and Game League.

St. Louis, Mo., Jan. 29.—*Editor Forest and Stream:* I inclose clipping from the Globe-Democrat of Jan. 27, which is self-explanatory:

About 300 persons interested in rod and gun sports met at 2127 Franklin avenue, in response to a call by various hunting and fishing clubs of St. Louis and vicinity, for the purpose of discussing game and fish legislation and to create a State-wide organization to advocate the securing of a large tract of land in the Ozarks to be used as a State park, game preserve and fishing resort, for the benefit of citizens of this State.

A permanent organization known as the Missouri Game and Fish League was effected with the following officers: Sam Stannard, President; T. M. Sayman, Vice-President; Henry C. Griesdieck, Treasurer, and H. F. Mardorf, Secretary. There were representatives present from many organizations, and representatives were selected to represent their clubs and co-operate in the movement to advocate adequate game and fish legislation during the present session of the Legislature. Also, if possible, to obtain the acquisition by the State of a State park and reserve.

The secretaries of other clubs throughout Missouri are urged to send their names and the names of their clubs to Secretary H. F. Mardorf, 4068 Olive street, St. Louis, so they can get in touch with the movement and unite for a common cause. Considerable talk was indulged in by speakers in alluding to the present systematic effort to repeal all game and fish laws in Missouri and leave no protective measures for game and fish. Letters of regret at not being able to be present were received from nearly one hundred persons, including Gov. Herbert S. Hadley and State Game and Fish Commissioner Jesse A. Tolerton.

The league heartily indorsed the Senate bill introduced in the Legislature by Senator T. J. Feaster, of Climax Springs, in Camden county, which bill proposes to purchase the famous Ha Ha Tonka Park, in Camden county, comprising over eleven and a half square miles of a scenic beauty spot in the Ozarks, which, if acquired by the State, will become as famous as the Garden of the Gods in Colorado or the Yellowstone National Park. All this tract of land can now be acquired, it is stated, by diverting a part of the fund yearly collected from hunters' licenses, without interfering with the present operations of law enforcement and continuing the distribution of imported pheasants and partridges, as now being conducted by the State Game Department. H. F. Mardorf.

Game and Fish in New Jersey.

The last report of the Board of Fish and Game Commissioners of New Jersey says that the revenues of the board have increased, and have made possible an efficiency never before attained. The second year of the resident license law has been successful, and opposition to this tax has practically ceased. It is regarded as a general protective measure and a long-needed regulation of gunners, who thus pay for stocking and for police protection without cost to the citizen who does not hunt or fish. The amount received during the year for resident licenses was $57.731.50; non-resident license fees were $5,990, an increase of $530. The fees for unnaturalized foreign born license holders were $560, a loss of $40.

In 1909 the open season for deer—Wednesdays in November for the shooting of bucks only—followed a closed period of ten years. Eighty-six bucks were taken and no person in the woods was mistaken for a deer and injured or killed. This resulted from the provision that only bucks may be killed, which obliged the hunter to make sure of what he was shooting at.

All salt water fish are greatly reduced in numbers. Perch and striped bass must be protected in the spring of the year when they enter bays and rivers to spawn or they will be exterminated. Nearly 10,000 brook trout were distributed during the year, beside black bass, white and yellow perch, crappie, pickerel, catfish and bait fish to the number of about 19,000. Fishing in fresh water lakes for bass, pickerel and crappie showed an improvement over former years, and the trout fishing, notwithstanding unfavorable conditions, compared well with that of previous years.

Game birds liberated were 5,650, of which 3,893 were imported English pheasants and 1,757 imported Hungarian partridges. The pheasants appear to have done well and bred. The partridges have not done well and seem to have disappeared in some places. A few European quail turned out disappeared.

Efforts to feed game birds during the winter were continued. Nearly 12,000 pounds of buckwheat seed was distributed through wardens to farmers who agreed to sow the seed and let it stand as food for quail.

The board recommends a bag limit not to exceed the number per day which follows the birds mentioned. Quail, 10; English pheasants, 3; Hungarian partridge, 3; woodcock, 10; ruffed grouse, 3; reed birds, 50; railbirds, 25; ducks, 20; geese, 10; brant, 10; shore birds, 25.

Upland plover should be protected for five years.

The season for shore birds should be from June 1 to January 1.

One law for the whole State with an open season from Nov. 1. to Dec. 15, for quail, partridge, grouse, English or ringnecked pheasants, Hungarian partridge, wild turkey, prairie chicken, woodcock, squirrel and rabbits. The season for waterfowl to be from Nov. 1 to Feb. 1.

Providing for the use of one or more game farms.

Providing that all wild State land shall be game refuges.

Prohibiting the use of silencers on guns of any kind.

Prohibiting the sale of all proteeted game, including water fowl, or the export of the same from the State all the year, exeepting in the ease of non-resident lieensees.

Amending Seetion 24, Aet of 1903, by striking out provision eontained therein in reference to dogs and deer.

Fixing the salary of the wardens at $75 per month, and the salary of the proteetor at $1,800 per annum, and providing for an assistant protector at $1,200 per annum.

Permitting battery shooting on Tuesdays and Fridays, the owner of each battery paying a lieense fee of $10 eaeh year, from January 1 to Deeember 31.

Prohibiting the use of any gun over ten-gauge under penalty of $100.

Fixing the cost of non-resident liecnse at five dollars to residents of States where the non-resident license is five dollars.

The Audubon Law. Providing that no person shall kill or eateh or have in his or her possession, living or dead, any wild bird other than a game bird, or purchase, offer or expose for sale any sueh wild bird after it has been killed or caught, and no part of the plumage, skin or body of sueh wild birds that are protected by law and not game birds, shall be sold or had in possession for sale.

Fixing a bag limit of twenty-five a day on trout.

Prohibiting the taking of bluefish under twelve inches in length.

Providing that striped bass shall be regarded as game fish, and for a period of five years shall be taken only with hook and line.

Fixing the season for crappie, ealico bass, black bass, pike, white and yellow pereh, white bass and pickerel from June 15 to Nov. 30, in fresh waters, and for white perch in salt waters.

Abolish netting fish under ice in salt waters.

Stop all netting in salt waters during May and June, excepting fykes.

Providing for a fish hatehery for trout, blaek bass, etc.

Providing that fines in fish and game eases shall be paid to the Fish and Game Commission for the use of the Commission.

Providing for a rod lieense in fresh waters for non-residents.

Canadian Non-Enforcement of Law.

Milton, Ont., Jan. 30.—*Editor Forest and Stream:* On aecount of the eontinued scarcity of ruffed grouse and blaek and gray squirrels in this (Halton) eounty, a number of sportsmen petitioned the eounty eouncil last year to memorialize the Government of the Provinee of Ontario to issue an order-in-eouneil prohibiting the killing of birds and squirrels for three years. The eouneil took aetion and the order-in-eouncil was issued.

It is possible that on account of it a few birds and squirrels have been spared, but it is eertain that many were killed, and there was not a single proseeution. There are salaried game inspectors in the county appointed by the Government, but evidently they have negleeted their duties.

O. T.

All the game laws of the United States and Canada, revised to date and now in force, are given in the Game Laws in Brief. See adv.

Vermont Fish and Game.

Bennington, Vt., Feb. 6.—*Editor Forest and Stream:* The Vermont Legislature has adjourned at last after one of the longest and most protracted sessions in the history of the State. We may now look complacently over the battlefield and see what has been won and lost. The real fighting advocates of fish and game protection are well satisfied with the general results, for, whereas, not many general measures of protection have been enaeted, nevertheless no backward step has been taken. The new trout law seems to attract the most interest and the deer problem seems to have been wisely solved. The open season for trout has now been fixed from April 15 to August 1 in streams and brooks, and from May 1 to September 1 in ponds and lakes.

The open season for deer is from November 15 to November 25, both dates inclusive, Sundays exeepted. The does are protected, and only bucks with horns at least three inches long may be taken by legitimate still-hunting. Hounds are not permitted to be taken in the forests during the open season for deer. Under the provisions of another measure, landowners who have been damaged by deer are permitted to kill the same, but are not allowed to retain the carcasses.

All the fur-bearing animals of the State are now protected until they are prime. Marten, mink, raceoon and fisher are protected from Mareh 15 to Oetober 15; muskrat from April 1 to October 15; fox and skunk from September 15 to October 15.

Rabbits and hares are protected from March 1 to September 15. A bag limit of not more than six rabbits to a single hunter in one day has been established, while the use or possession of ferrets has been forbidden. Also, it has been made unlawful to set, prepare or expose any salt-liek or other bait for the purpose of enticing deer or other protected game.

The warden system has been greatly strengthened by allowing the commissioner to appoint fourteen county wardens who will serve on a salary of not more than $75 per month, thus doing away with the per diem plan for county wardens. Besides this, quite a number of other measures have passed to give the commissioner more power to systematize the warden serviee and get better results in enforcing the laws.

Two acts have gone through paying bounties of $10 on black bears and thirty cents on porcupines, or hedgehogs, as they are called here.

Seining is to be allowed in Lake Champlain by residents of the State from Oet. 15 to Dec. 1, under lieenses granted by the commissioner.

Absolute proteetion has been removed on otter and these animals may now be taken from November 1 to March 1. The non-resident fee for hunting licenses has been reduced from $15 to $10. Various local laws have been passed protecting muskrats, and preventing the pollution of different streams and ponds. Persons who post their land against hunting deer are not to be allowed any reimbursement for damage to their crops by deer. As to game birds, upland plover are proteeted until 1915, wood-duck until 1916, and quail until 1911.

The above, I believe, sums up in brief all the changes which were made in our fish and game laws, but as for the bills introduced, it would require several columns to report them. Our laws needed very little changing at this time and the principal fight of the real proteetionists consisted in preventing measures of extermination from getting on our statute books. One watching the work of the Legislature was forcibly reminded from time to time of the desire of numerous members to "let down the bars." An enthusiastic member remarked to me: "Why don't these men who are introducing insidious measures to destroy the fish and game come out in the open and put in a bill to repeal all the game laws and be done with it, instead of claiming to be protectionists and introducing bills to exterminate everything." To which we answer: "Amen."

All of the members of the joint standing committee on fish and game seemed to have the best interests of proteetion and preservation in mind and worked for that result, but it is no disparagement to other members to call especial attention to the efforts of the chairman of the house committee. This plaee was filled by Col. Franklin S. Billings, the member from Woodstock. Col. Billings is a member of the Boone and Crockett Club, of New York, and was well grounded in the prineiples of fish and game protection before he eame to the Legislature. He was fighting for good laws all the time and his efforts are indefatigable. He kept the fundamental prineiples of preservation constantly in view and consistently fought and defeated every measure of extermination. Enacting laws to please selfish constituents had no part in his plans. He was the mainstay and hope of all the true believers in the eause and never once did he fail us or compromise with the enemy. He is a public-spirited man in every sense of the word, and his whole eourse during the present session has been one of which he may well be proud. The State at large, and especially the fish and game advoeates, owe him a debt of gratitude which will be difficult to pay. Certainly he will not be forgotten and you are sure to hear of him in public life. Col. Billings is the type of man the country is looking forward to at this time. He is progressive and aggressive. If he thought a measure was not for the best interests of the State, he would say so at once and fight it hard. Not only has he made a fine record in fish and game legislation, but he was equally energetic for other measures tending to the good of the whole State.

To sum up then, we may say Vermont has taken another step forward in the matter of conservation of our supply of fish and game and we may now be well recognized as one of the advanced States in this cause. We are gradually going forward in spite of efforts made to the contrary, and if the advocates will only present a united front and work in harmony nothing can prevent us from taking the lead.

Harry Chase.

Midwinter Vipers.

The singular mildness of the last month was strikingly illustrated in the killing of a large viper at Christmas on a Dartmoor farm, a thousand feet above the sea, by a lady.

The reptile was copper eolored, and some naturalists contend that there is more than one variety of British viper, a reddish kind being peculiarly venomous.—Westminster Gazette.

Mr. Rainey Goes to Africa.

Paul J. Rainey, best known for his trip to the Arctic, and his gifts to the New York Zoological Socicty, sailed last week on a hunting expedition which is announced to cover parts of East Africa, India, Borneo and the Malay Archipelago. It is stated that Mr. Rainey will represent the New York Zoological Society, of which he is a member, and the Smithsonian Institution of Washington, in his hunting. He will endeavor to capture living animals for the Zoological Society. He takes with him an elaborate camera outfit, and hopes to bring back moving pictures of many interesting things. Those who have seen his pictures of the Arctic speak of them with great enthusiasm.

Mr. Rainey will be accompanied by Dr. M. E. Johnston, a physician and a botanist, who will make collections of the flora of the countries visited. He takes with him a pack of dogs to be used in hunting, and the trainer in charge of them, Edward Shelley, sailed with the dogs some time ago.

It is announced that the safari will start out from Nairobi, and that Mr. Rainey will stop at Hugh Heatley's ranch. Mr. Heatley is the man who spent some time in New York a few months ago trying to get up an African hunting club.

From Nairobi Mr. Rainey says that he will go north past the base of Mt. Kenia to Lake Rudolph and from there return to Nairobi. After that he expects to go to Bombay, India, to the Malay Archipelago and to the South Seas. He hopes to bring back alive many interesting animals and pictures.

Mr. Rainey is quoted as saying that he expects all the white men will be stricken with fever on the Masai Reserve, but about this he is probably needlessly alarmed. Men taking proper precautions have hunted there for months, without being threatened by the fever or even obliged to take quinine.

He is also quoted as saying that the rains are over by July. This hardly accords with recent experience, for in July, August and early September rains are likely to continue, though the rain scarcely begins before 11 o'clock in the day and stops toward the end of the afternoon, so that it is often possible to make a short hunt before dark. Mr. Rainey hopes to see the Masai warriors kill lions with their spears, and is quoted as saying that several of the warriors are killed in each hunt. This is probably a misquotation. It is recalled that in the hunt reported by Colonel Roosevelt, none of the Nandi warriors who took part in the hunt were killed. It is understood also that Carl Akeley had a lion hunt, which lasted nearly a month, and yielded we believe fourteen lions. We have not heard that any of the Nandi were killed in these hunts.

Before Colonel Roosevelt saw the hunt made by the Nandi, Mr. Hoey had the warriors out for a day, so that they might understand the signals and become accustomed to the country. On that day a lion and a lioness were put up. In one of these cases—probably that of the lioness—only one man was near her when she broke cover, but he attacked her, killed her with his spear and then—an eye witness has said—"sat down on a rock in a bored way and took snuff." The risk of injury is greatly lessened when a number of men are out, yet one or two warriors do not hesitate to attack a lion. With a leopard it is quite different. It is smaller, much more active and quick, and the warriors prefer to have at least a dozen men along when they have a leopard at bay.

A friend recently returned from Africa, speaking of this sport, says: "It is a very fine sight to see them. I was present at a drive once where a lot of Nandi went into a river bed after a lioness and two cubs. The tangle of scrub, vines and long matted grass was so dense that one could see practically nothing, and I would not have crept in there even if I had been wearing a suit of armor. Yet the Nandi plunged in, throwing away their shields and spears when they could not force their weapons through the bush, shouting and yelling, the ones behind dragging back those in front in their eagerness to get ahead. We sat with our horses headed toward the plain—and looked back over our shoulders—so as to be ready to gallop off if she burst out, and charged the horses, as a lion or lioness generally will do. Fortunately, the noise and yells frightened the lioness and she slunk off without showing fight.

"It is rather a curious fact, and one which I do not think has been commented on, that when a lion that has been hunted on horseback and turning to bay charges, it will frequently charge the horses and not the hunter. It will almost always charge a white horse if there be one, rather than a dark-colored horse."

Ptarmigan in Newfoundland.

St. Johns, N. F., Feb. 1.—*Editor Forest and Stream:* Partridges (ptarmigan) were never more plentiful than they were last season. The weather during the fall was very mild, so that large quantities of birds that were shipped to local grocers became heated and had to be destroyed. They sold generally for fifty cents a brace, but numbers were sold much cheaper in order to clear them off. I inclose a clipping from a paper which I cut out last month that may interest readers who take pleasure in small game shooting:

"C. Murphy, of Baine Johnston's, who is a very truthful man, and who arrived from Branch recently, says that partridge are being killed with sticks up there in large numbers. They are abnormally tame and are being packed in boxes after killing for the St. Johns market."

"Mark Leamon, at Petty Harbor, went out gunning recently at Petty Harbor and shot 272 sea birds."

Crows have of late years increased in great numbers in the country around St. Johns. They are scavengers generally feeding on offal found among ashes which the farmers get from the sanitary department for making compost. But according to some observers the crows have started a "new industry" and have decided to add to their ordinary menu the juicy English sparrow that infest the city in large and increasing flocks. The following cutting explains:

"Crows are present in large flocks in the suburbs of the city just now, especially in Buckmaster's field. They swoop down on the English sparrows on LeMarchant Road, and taking them up in their talons fly out of danger into the field and devour them. The same thing was witnessed at King's Bridge Road recently."

W. J. Carroll.

To Encourage the Protectors.

In his annual report as Chief Game Protector, John B. Burnham, now Deputy Commissioner of Forest, Fish and Game of New York State, outlines a plan, having in view the rewarding of protectors for efficiency.

In the past six years, he says, the number of cases handled by the protectors has increased 400 per cent. and the division system of itself has greatly increased the work of the executive heads. The Division Chief, under the present system, receives weekly reports from his men and is in constant communication with them, directing them in their work and advising them in the conduct of their cases; much of his time being spent in traveling over his division. While the position of Assistant Chief, under the old conditions, was something of a sinecure, under present conditions there are no harder worked men on the force than the Division Chiefs; therefore, I believe they should receive the same pay as the Fire Superintendents, viz., $1,500 per annum. For the purpose of increasing the efficiency of the game protectors, each protector should have some financial incentive to spur him on to his best efforts. His work is hard and sometimes dangerous. The plan followed in some police departments of increased pay for continued service might be adopted with advantage. Each protector should understand that if he did not attain a certain percentage based upon cases and faithful service, he would be dropped from the force. On the other hand, he should be paid an increased salary after a certain period of service, and after twenty years he should be retired on half pay, just as is done in the New York police force. Protectors are now paid $900 salary per annum. I think that after two years' service they should receive $1,000, and have a raise of $100 every other year thereafter until their pay is $1,200. Any year of this period that a protector failed to make a fixed percentage, even though he qualified to remain on the force, should be disregarded as time counting for increased salary. Under this system, for at least six years and probably for a longer time, the protector would be nerved to additional effort by the incentive of an increase in his salary. Beyond that period the incentive would come from the prospect of a pension after twenty years, which he could not gain provided he did not give good service.

The bane of all State work is half-hearted service. A State employe is apt to degenerate into a mere placeholder. A political job is a poor one at best; its tenure is uncertain and chances of promotion are limited. The first step in making an effective game protective department is to take it as far as possible out of politics, and this has been achieved in this State by putting the protectors under competitive civil service. The second step should be to create an incentive which would warrant a good return for well directed effort, and counteract the lethargic effect that is apt to overtake even the best man who holds a reasonably sure State job. A wise chief protector provided with a system of rewards such as above outlined could accomplish wonderful results with his men. The only thing required then would be some way of positively insuring good men in their tenure in office.

Massachusetts Legislature.

BOSTON, Mass., Feb. 2.—*Editor Forest and Stream:* Another line of work suggested by the Massachusetts Commission on Fisheries and Game is an investigation to determine how birds which feed upon gypsy and brown-tail moths, etc., can be "increased or colonized within the infested regions, or in special localities." Possibly something might be done by Prof. Rane who, in addition to his work as State forester, has charge also of the apparently insurmountable task of suppressing the ravages of the various moth pests. In this he is meeting with difficultics. From present appearances his work in reforestation is mere child's play in comparison.

The fish and game commission asks also that provision be made for rearing game and insectivorous birds by the leasing, purchasing and constructing of increased facilities for this work, and that part of the money received by the Commonwealth for hunters' licenses should be expended annually for the purpose of acquiring land for such purposes.

On Feb. 1 there was a large number of men from the shore towns (chiefly) in attendance upon the hearing on House Bill 619 providing for winter and spring shooting of whistlers, coots, shelldrakes and brant. Ex-representative H. A. Ellis, of Hyannis, conducted the hearing for the petitioners. Orville D. Lowell, Fred K. Swift, Charles Nye, F. J. Orstrom, J. Arthur Jacob and ex-representatives Pattee, of Falmouth; Gifford, of Westport, and Collins, of Edgartown, testified in favor of the bill as did W. C. Adams, secretary of the Massachusetts Gunners' Association; Fletcher Osgood, President, and C. H. Brown, of Vineyard Haven, of that association. They claimed that while these birds have never found favor in the market, many families among the natives liked to take them for table use in limited numbers. Also that they are not to be classed as insect-eating birds, useful to the agriculturalist. Some of the witnesses laid great stress upon the destruction of scallops by coots and shelldrakes.

The remonstrants were led by ex-representative J. A. Lowell, of Newton, and among those who spoke at considerable length in opposition to the bill were Dr. Frederick T. Lewis, representing the Boston Society of Natural History, and ex-representative Charles M. Gardner, master of the State Grange.

Mr. Gardner emphasized the strong sentiment for bird protection existing among the grangers throughout the Commonwealth, and Dr. Lewis quoted the opinions of several well-known ornithologists. The Senate chairman of the committee announced that an adjourned hearing would be given in some one of the Cape towns.

HENRY H. KIMBALL.

About the Roosevelt Expedition.

J. ALDEN LORING, long a correspondent of FOREST AND STREAM, well known as an accomplished field naturalist, and constantly spoken of in Colonel Roosevelt's account of the Smithsonian's Scientific Expedition to East Africa, has prepared a lecture entitled, "Through Africa with Rooseve't." The subject cannot fail to interest everyone, for it tells movingly the story of a year's sojourn in a land of which little is known and much is imagined. The lecture is illustrated by over 250 colored slides made from photographs taken by members of the expedition—Colonel Roosevelt, Kermit Roosevelt, Mr. Heller and Mr. Loring. The lecture—though as yet delivered in only a few places—has attracted much attention, and is spoken of with great enthusiasm by the newspapers. A wide popularity may be expected for it. Mr. Loring's address is Owego, Tioga county, New York.

Guns and Revolvers in Venezuela.

THE total imports of arms and ammunition into Maracaibo for 1909 amounted to $20,511, the origin being as follows:

Article.	United States.	Germany.	Spain.	Total.
Ammunition	$244	$3,179	....	$3,423
Guns	5	4,250	$354	4,609
Cartridges	223	....	....	223
Revolvers	11,169	....	460	11,629
Percussion caps	508	....	119	627
Total	12,149	7,429	933	20,511

Although the United States supplies more than one-half of the total, investigation would lead one to believe that we should not only supply a much greater share, but that with a little effort the total imports could be greatly increased. A great many more guns and rifles could be sold if this market were investigated and the right articles offered for sale. Two things must be considered: First, a cheap and reliable gun; second, that it be of a class for which the ammunition is not too expensive.

The most popular rifle is the lever-action repeater, both in carbine and rifle lengths, shooting black-powder cartridges of .38 or .44 caliber. The modern small-caliber high-power rifles, using steel-jacketed bullets, are not popular, owing to the high price of the cartridges. There would be a good market for the old model .38 caliber carbines, with lever action, if they could be furnished at a low price.

All varieties of shotguns can be found in use. The wealthier classes use German, English and some American double-barrel breechloaders of 12, 16 and 24 gauge. The poorer classes and the country people use light-weight, single-barrel, Spanish fowling pieces of the muzzle-loading type. The majority are of small bore, about 24 gauge, and are fitted with slings to carry suspended from the shoulder. They seem more like toys than real guns, but are especially well liked because they use such a small amount of ammunition. The breechloaders sell here for from $15 to $30, and the muzzleloaders from $8 to $12.

The revolvers and pistols most in favor are generally of a high grade. The revolvers are American .32 and .38 calibers of standard makes, costing from $8 to $15 and retailing here at from $16 to $25. In pistols the modern automatic models are becoming more popular. They are sold in .25 and .32 calibers at $15 to $30.—Consul Ralph J. Totten, Maracaibo.

Dr. Waddell Lectures.

DR. J. A. L. WADDELL, widely known as the bridge engineer of Kansas City, and an ang'ing correspondent of FOREST AND STREAM, not long ago delivered two lectures before the faculty and students of the College of Engineers of the University of Illinois. One of these lectures was on materials of bridge engineering and foundations, and the other a more general talk on bridge construction.

Reforesting.

THE New York State Forest, Fish and Game Commission has just issued Bulletin 2, prepared by C. R. Pettis, Superintendent State Forests, for the purpose of giving citizens definite detailed information on how to start a forest. There is combined in this pamphlet information relative to securing planting stock, the most desirable kinds to use under different conditions, when to plant, how to do the planting and some data as to the results that may be expected.

Reforesting, says Mr. Pettis, means the establishing of forests on lands formerly under forest cover. It may be secured either by nature, from wind sown seeds, or by man planting small trees or sowing seeds. Nature is so slow and erratic that she cannot be depended upon. Experience in planting trees and sowing seeds in the field under varying conditions clearly indicates that planting is a successful method, while broadcast seed sowing is too expensive and uncertain to be used generally. Trees for this purpose may be collected in some localities where there is a sufficient supply, may be purchased or can be grown from seed. The first named source offers but a limited supply, the cost is usually high and the success of such plantings uncertain, because such trees generally have but few roots, which increases the loss in transplanting.

The purchase of trees for reforesting purposes is difficult because there are not at present commercial nurseries growing the desired kinds of trees in sufficient quantity. The demand being much greater than the supply, high prices have resulted.

The Forestry Department of the State of New York maintains several large nurseries for the propagation of forest tree seedlings and transplants—pine, spruce and other species—for reforesting the public lands and for distribution at a nominal price among landowners in this State who may wish to undertakc reforesting operations on thcir own account. The price of these seedlings and transplants is small, being placed at thc bare cost, but varies with the age of the plant and species.

Any landowner who desires trees for planting land in order to raise a forest can secure them while there is a supply on hand by making application to this commission. Blanks will be sent upon request. These blanks are printed each year and distributed about Jan. 1, and must be completely filled out and filed in the office of this commission not later than March 1 of any year in order to secure trees for planting that spring.

No trees will be sold for ornamental planting. Trees will be shipped during the month of April and May following.

Parties intending to do a large amount of planting with transplants will find it desirable to purchase seedlings and set them out in a cultivated field garden for one or two years. The demand for transplants (seedlings transplanted for one or two years in the nursery) is so great that we are unable to fill all orders, but by purchasing seedlings and transplanting them at home a planter can have a supply when desired without increased expense. A large saving in transportation will be effected by purchase of seedlings.

(*Continued on page 232.*)

SEA AND RIVER FISHING

The Coachman.

THE right fly is the fly that catches fish, no matter what the color, make-up and size. There are some who forget this truism and rather than use a lure that under the conditions is not authorized by the experts will carry a creel as empty as a blown egg.

I once met an angler who scoffed at my coachman. "But I caught these trout," I said, showing some fine fish. He poked over a nice half-pounder as if he were handling a sucker. "I never use a coachman," he replied with a dogmatism that fairly barked at me. "There isn't a natural insect on any stream resembling that fly."

I watched him as he fished the next pool below, making a neat cast, but his basket flopping as no creel ought to flop toward afternoon. The trout were making circles all around his flies, but they did not seem to want the Scotch midge he had shown me with such pride.

David Forster, in his "Scientific Angler," gives Tom Bosworth credit for the invention of the coachman. Bosworth was the famous royal coachman for three successive British rulers; King George IV., William IV., and Queen Victoria. He had the reputation of being a wonderful fly-fisherman, and was no less noted as a "whip," being so dexterous with the long lash used in those days, that while steering four gal'oping horses he could snap the pipe from the mouth of a passing pedestrian.*

Inventions repeat themselves indefinitely. If some one finds that the Chinese had flying machines in the 'teenth century, B. C., it will surprise none of the students of the history of inventions. And as to Tom of the lash being the first to use a fly of the characteristics of the coachman, let us turn to Charles Cotton's second part of "The Compleat Angler."

Cotton describes what he calls a blue dun, with a hair dubbing from the combings of a black greyhound, and a wing "that can hardly be too white." If this blue dun had a cock's red hackle for legs, as was very likely, there are few who would have keen enough eyesight to tell the difference from Tom Bosworth's coachman at two yards distance.

But it really does not matter who invented this natty fly of the white wing; any angler can buy them at any tackle store and feel certain that he has one lure, at least, that will catch fish at almost any time, morning, noon or night; whether the sun shines, or it rains; if the stream is clear as distilled water or the consistency of coffee in a fishing country; if the trout are native, rainbow or brown.

"What flies are the thing?" two years ago I asked an angler, referring to a proposed trip to Esopus in the southern Catskills. "You'll probably carry fifty-eleven different kinds," he replied, "they all do; but you really need only one—the coachman. The fish up there seem to know they belong to New York—the new water supply system—and they like plenty of 'white wings' around."

When I asked a local fisherman concerning the lower Neversink, where large brown trout are found, his answer was, "Coachman, coachman, coachman," he added, "these brown fellows are old-fashioned; they don't use autos."

In Mrs. Marbury's "Favorite Flies," in which there are letters from anglers living in every part of the United States and Canada, the coachman is mentioned more times than any other fly. It may be interesting and no less instructive to put this in figures. Tom Bosworth's favorite stands first, being recommended sixty-three times, with the professor second, it being referred to in forty-four letters; then the brown hackle thirty-seven, the silver doctor, Parmacheene belle and grizzly king, twenty-four times, and so on down to the queen of the water, fifteen.

Now, fly-fishing is not an exact science; it is a good deal like comet astronomy: a sort of now-you-hit-now-you-miss kind of business. Why a trout wants a particular fly is as unaccountable as why a girl wants a particular man, or a man wants a particular girl. And when a trout wants that particular fly, you cannot change his desires any more than you can those of the aforesaid man or girl.

It is therefore of the greatest importance to throw at a trout what experience has taught that he will take nine times out of ten. The coachman is such a fly. If trout are feeding, nine times out of ten they will rise to that lure. Of course there comes the tenth time when they will have nothing to do with our white-winged friend; they are as little interested as an epicure in a favorite dish that he has indulged in for nine successive nights—he wants a change. And it is well for his tenth time to have a large assortment of many varieties of flies.

A playwright of national reputation used to fish the Willowemoc in the neighborhood of De Bruce. His success was so remarkable as to make his rivals envious to the extent that green tinged the trout they were triumphantly shown nightly. I once had the temerity to ask him what fly he found most successful. The answer was as ambiguous as the warning of an Athenian sibyl.

But one day I caught him landing a big trout that had something white in its mouth, and charged him with the coachman habit. "Why, yes," he said, with assumed indifference, "you see, my eyesight is a little poor, and I keep on a coachman as a trailer to locate my cast—I can see it better than a darker fly." Through his glassess I noted a twinkle as he added, "They sometimes take it."

"Sometimes take it!" I should think they did. During the past two fishing seasons I have been at the streamside a total of more than one hundred and twenty-five days or parts of days, and they sometimes took it on not less than one hundred and ten!

There is an almost infallible method in fly-fishing—catching trout with a fly. It is so certain that if the angler will make it his own he can be as sure of catching trout as he can of anything in this uncertain world. And if some one suggests that I be presented with a medal for my disinterestedness in giving the tip to the angling public, I shall feel that it comes to me as my right and shall have no scruples in taking it. I suggest that it be of gold with a coachman in diamonds on one side, and on the other this motto, "Chapeau Bas."

Edison must glow internally as he looks up Broadway of an evening from Thirty-third street; and as I think of what I am about to divulge, I feel a complacency that is akin to that which must tinge the ego of the great inventor.

And, like all great inventions, it is extraordinarily simple and the concentrated essense of experience. But it must be used by those who know something concerning the art of angling. An African savage, fresh from his hut of leaves, could not drive an auto; and a man must be able to make a neat cast to use the method I am about to explain. But, granted that he is fairly skillful with the rod, he can be sure of catching more trout than he ever has before. This invention consists in always keeping a coachman on the leader as the tail or stretcher fly. Why it is not successful as a dropper, I am at a loss to understand; but, by repeated trial, it is not very satisfactory unless at the end of the cast. As to size, I have found No. 10 to be best adapted for the streams of New York State. On large rivers like those on the north shore of Lake Superior, a much larger fly would be successful.

The very simplicity of this method commends it. It is not the complicated ideas that are most generally of the greatest service; all science and art aim at an economy of means for a desired end.

My claim for the coachman used always as a tail or stretcher fly, is that it will give results not attainable by other methods. And by using three flies—two droppers and the coachman—any number of varieties can in turn be presented, always keeping the coachman as the important fly of the cast.

There is one certain way for the angler to prove the practical value of my contention—to try it. That is easy, and the coachman can be bought at all tackle stores, even those that keep a small assortment of flies.

If an angler will keep a coachman as the stretcher fly for one angling trip, never removing it but to put on a fresh one, I am as sure of his complete conversion to my method as I am that he will catch more trout than he has even in his wildest and most ambitious dreams believed possible.

LADD PLUMLEY.

*Forster also said, "Bosworth originated the coachman fly so much appreciated for night fishing. This artificial has recently been much used as a fancy fly, for day fishing, and with considerable success."—EDITOR.

All the fish laws of the United States and Canada, revised to date and now in force, are given in the Game Laws in Brief. See adv.

Gordon's Fancy.

In an autumn issue of Forest and Stream, I saw an article written by one whose whereabouts had become unknown by the writer, but who is near and dear to me, for I have spent many happy hours in his company on that famous and productive trout stream, the Beaverkill. Its author is that clever fly-tying artist, sportsman and gentleman, Theodore Gordon.

I first made Mr. Gordon's acquaintanee in 1906, when on a fishing trip on the Beaverkill river. The stream has its source in Slide mountain, a part of the Catskills, and from its beginning to the point where it joins the Willowemoe river at the little village of Roscoe, about 130 miles from New York City, it is a series of pools for over thirty miles. The banks are heavily timbered and beneath them the brook trout find delightful retreats. It is a fisherman's paradise and visited annually by a number of men who think for nine months of the pleasures of a day on its silver waters.

Two species of trout inhabit the stream, the old pioneer brook trout and the brown. Unlike the native brook trout, the brown trout are particularly aggressive in the early spring, and grow rapidly, often reaching the six pound mark. They are cannibals, and when one of their number beeomes permanently located in a large pool nothing in the way of small fish or food is allowed to escape its rapaeious jaws.

When I met Mr. Gordon I was sitting beside a large pool on this stream, where the water had a peeuliar swirling motion under an overhanging tree. I sueeeeded in raising an exceptionally large fish, which eame to the surface in a sluggish manner, giving a view of his broad back and side to the extent of fifteen or sixteen inehes. My fly was the Rube Wood. Swift water and the length of my east were against the trout getting a firm hold and I was unable to hook him seeurely. Having fished for the large ones repeatedly, I realized that the golden opportunity for the day was past. The ehanees were a hundred to one that he would not rise again that day and with these unpleasant truths in mind, I sat down to collect my nerves, inspeet my tackle and study the possibilities of getting nearer the old monareh, ere I again dropped the east over his home. A voice attracted my attention and upon looking up I saw a stranger, whose cheery greeting of "What luek?" led to a eonversation. The stranger proved none other than Mr. Gordon and this pool was one of his favorites.

A glance at his taekle told me that he was a real fisherman, and I exposed my secret of the big trout that I had suceeeded in raising in the pool beside us. Mr. Gordon insisted that I try again, whieh I did, but as expeeted without success. We then began to seheme to entiee the old fellow again to feed. It was then that I diseovered Mr. Gordon's tact and ability. He matehed and exaetly duplieated in shade and color a fly like those that were swarming about the stream. Along the banks grew some willows, and in these Mr. Gordon found several fine specimens of the fly. After securing a large one, Mr. Gordon produced a box of feathers, gut and No. 12 fly hooks. In a remarkably short time he had tied a beautiful duplicate of the original and handing it to me insisted on another effort at the old trout.

We decided to go up stream, cross the rapids and address the pool from an entirely different point, an achievement which has produced results for me many times since. Whipping my fly and leader dry, and measuring the length of east on another part of the pool, I was ready to make the supreme effort, especially anxious for results, after the amount of interest my friend had taken in the matter. Waiting for a slight breeze to abate, I carefully dropped our latest tempting lure close up to the bank and directly over the home of the fish. There followed a rush, splash, a strike altogether different from that of an hour or so before, and he had it.

The fish was larger than I expected, and despite all efforts to force him out of the pool against the rapids, he suecessfully evaded me and pulled like a young dog to get underneath the overhanging bank. My rod weighed but 4½ ounces and with every sueceeding rush for the bank came the reminder of a light leader and a No. 12 hook. Finally, I called over to Mr. Gordon: "I'm going in there, wet or no wet," and in I went over the waders and all. It was May 22, and the mountain water was eold as iee, but this movement was more than the old monareh eould stand. With a rush he started down stream, and for fully one-eighth of a mile we tumbled over rocks and boulders. I won, and when Gordon eame up to me on the bank, the rule said 20¼ ineches and the seales three pounds, eight ounees. I dubbed the fly "Gordon's Faney," and this fly is known to-day by nearly every fly-fisherman in the eountry.

That evening we ate supper together at the Trout Valley Farm, at Beaverkill, N. Y., and the next day found us fishing in a lake inhabited by brown trout, whieh had the reputation of not yielding easily to the lures of fishermen. We mastered the reason why and suceessfully fished it, landing a number that varied in length from 19 to 24 ineches. We used another fly of Mr. Gordon's ealled Bumble Puppy, without exception the greatest lure for lake trout ever used after they have reaehed the 2½ pound mark.

M. T. Davidson.

Big Albacore at Catalina.

Los Angeles, Cal., Jan. 22.—*Editor Forest and Stream:* Every winter about this time somebody sallies forth from Avalon, Catalina, and conneets with a sehool of full grown albacore. Last year it was the lot of W. N. McMillan, of Nairobi, British East Africa, to turn the trick. A pair of albaeore of fifty pounds was the result. This season one of forty-seven pounds has been landed. The reeord is sixty-five pounds and no one is worried about its lasting.

Edwin L. Hedderly.

A 176-Pound Catfish.

What is probably the largest catfish ever captured in an Iowa river was pulled out of the Nishnabatony River here by men who were excavating for a foundation for the new dam. The fish weighed 176 pounds. Its mouth was filled with sears, and several fish hooks were imbedded in it.

The fish is supposed to be the one hooked so many times by fishermen near here, none of whom was ever able to land the monster.—St. Paul Pioneer Press.

Illinois Casting Club.

Chicago, Jan. 28.—*Editor Forest and Stream:* The Illinois Casting Club held its annual meeting and election of officers on January 16, at which there was a large attendance. After dinner was served, the meeting received with much interest the reports of the offieers of the outgoing administration. There was especial appreciation evidenced at the report of scores made by the club members, as compared with known record scores, which are given herewith.

The report of the executive committee was very comprehensive, containing valuable suggestions for consideration of the club. The report of the secretary shows the club to be in a flourishing condition, both as to membership and finanees.

An important action of the meeting was the adoption of a new elub badge and bars as tokens, in lieu of button emblems used and given by the club. It was also suggested that a new degree be created, the same to rank between master and artist, beeause of the long gap between the 98 per eent. and 99 per eent. degree awards.

The eleetion of offieers resulted as follows: President, A. Bauer; Viee President, G. H. Asper; Seeretary and Treasurer, H. D. Willis; Captain, H. D. Kirk; Committeemen, N. C. Heston, Dr. E. F. McCarty, Charles W. Keiser.

A hearty vote of thanks was extended to the outgoing offieers.

Secretary A. D. Whitby made the following report, showing a comparison of high scores made by the club during the past season as compared to national reeord scores in each of the several events of which they have authentie record.

The average attendance in 1909 was 26; the average attendanee in 1910 was 33; the number of eompleted seores in bait and fly events in 1909, 26; in 1910, 36.

In the quarter ounee aeeuraey bait W. H. Ball (on June 18) and E. K. Pierson (on Aug. 29) made seores of 99 7/10 per eent., the highest scores made in either of the aeeuraey baits in the history of the game. The tie was east off at the club tourney on Oetober 9, and was won by W. H. Ball whieh earned him what is known as the "All Chicago High Seore Button." The seores made by Messrs. Ball and Pierson established new elub records, and are undoubtedly world reeords.

In the half ounee accuraey bait W. H. Ball (on June 4) and J. T. Hartly (on the same day) made seores of 99 5/10 per cent., which equalled the elub reeord of last year, made by J. E. Amman. This score was also made by D. F. Beatty at the National Tournament of 1910 and by O. E. Beeker, both of Chicago Fly Club.

In the quarter ounce distanee bait (average of 5 easts) L. E. De Garmo established a new club reeord (on August 27) of 143 3/5 feet, and N. C. Heston a new elub reeord for the longest single east (on same date) of 167 2/3 feet. These seores were exeeeded by N. L. Place, casting for the Anglers' Casting Club of Chicago (on Sept. 11) who scored 154 1/3 feet (average of five casts) and 177 feet longest single east, whieh are world records.

In the half ounce distance bait the elub record of last year was surpassed by C. E. Lingen-

felter (July 30) who cast 209 2/5 feet (average of five casts). The record for the longest single cast is still held by L. N. Place, 221 feet, while O. E. Becker (of the Chicago Fly Club) has a record of 230 feet for the longest single cast. These scores (previously world records) were exceded on Sept. 10, by Reuben Leonard, who (casting for the Newark Casting Club) scored an average of 218 4/5 feet with the longest single cast of 237 feet.

In the accuracy fly the club record held by N. C. Heston was equalled during the past season by both Messrs. Heston and De Garmo with scores of 99 9/15 per cent. These scores were exceeded by T. A. Forsyth who at the National Tournament of 1910 scored 99 13/15 per cent. The world's record for the event is held by I. H. Bellows who, casting for the North Shore Casting Club, made a perfect score, the first in the history of the game.

In the delicacy and accuracy fly, L. E. De Garmo exceeded the previous club record (held by him) and raised the club record (on Aug. 6) to 99 2/30 per cent. Previously the record was exceeded by F. C. Kierulff who (on Aug. 20) casting for the San Francisco Fly Casting Club, raised the record to 99 24-30 per cent.

Light tackle dry fly accuracy. This event, (using five-ounce rod) was played for the first time during the past season, and there is therefore no record. On Aug. 13, L. E. De Garmo made two scores of 99 8/15 per cent., and on the same date, N. C. Heston scored 99 9/15 per cent., which establishes a club record. The record for this event (so far as our data indicates) is held by I. H. Bellows, who, casting for the North Shore Casting Club, scored 99 11/15 per cent.

Distance fly. Our previous club record (101 feet made by W. H. Ball) was this year broken and is now held by H. D. Willis, who, on Sept. 10 cast 103 feet. This score has, however, been exceeded several times, notably by W. D. Mansfield, L. S. Darling and F. N. Peet, the latter casting 117 feet at the National Tournament of 1910. The world's record for this event is 140 feet, held by Mr. Golcher, of San Francisco.

Distance fly light tackle. This event was played by our club for the first time during the past season and our record is W. H. Ball (July 9) 99 feet. This cast was exceeded by F. N. Peet at the National Tournament of 1910, who won the first place with 102 feet. The world's record is held by W. D. Mansfield with a cast of 120½ feet.

Salmon fly. Our record of last year, 120 feet made by L. E. De Garmo, was broken several times the past season, L. E. De Garmo casting (in club contest) 133 and 135 feet, and W. H. Ball, 138½ feet, which latter distance is our club record. In the National Tournament of 1910, W. H. Ball established a new world's record by casting 140½ feet with a regulation (15 feet) rod, slightly exceeding E. J. Mills' cast of 140 feet made in 1908.

At the National Tournament held at Garfield Park the past season our club won the much coveted honor for carrying off the pennant with thirty points to our credit.

In the "all around," W. H. Ball and L. E. De Garmo, of our club, carried off the first and second cups respectively, against a representation from 13 other clubs.

In the accuracy events (two each in bait and fly) wherein it was necessary to have an average of 98 per cent. to qualify, there were seven casters who qualified, of which number our club stood 1, 2 and 3, namely, W. H. Ball, N. C. Heston and L. E. De Garmo, N. C. Heston casting for the Chicago Fly as well as our club.

In the inter-club contest held on July 17 between the Illinois and Chicago Fly Clubs, our club won out with a general average of 98.40 per cent., thus winning four of the series against the Chicago Fly, three out of five necessary to possess ownership of the cup. The second series of the season was not played, the Chicago Fly team failing to come to time.

A season's average in the accuracy bait events entitling a member to the degree of Artist was awarded for the first time in our own or any other club of which we have record, to W. H. Ball, whose season's average was 99.14 per cent.

H. D. Willis, Sec'y.

Kansas Lakes.

Two years ago the Kansas Legislature failed to appropriate money for the maintenance of the game department. Since then Governor Stubbs has been paying the department's expenses out of his own personal contingent fund, the amount expended for this purpose being more than $7,000. Shooting license fees are turned into the State Treasury and credited to the fish and game department and there is now in this fund $64,750 awaiting action by the Legislature. In a short message the Governor has urged the Legislature to appropriate this amount for the fish and game department.

At the same tinme the Governor praised very highly the work that has been done by State Warden Lewis L. Dyche, and recommended that this office be taken out of politics, as has already been done in the Kansas Agricultural Department. Prof. Dyche not long ago urged every farmer in the State to build a pond and raise game or food fish, both for his own use and for the market. The subject has been commented on a great deal by the Kansas press, which has not taken the matter very seriously. It is not impractical, but the idea of "making Kansas a State of lakes" is evidently a difficult matter for some of the old time editors to digest. Greater changes than this have been brought about, and it may be that in time certain portions of the one-time desert waste will be covered with water.

Ice Fishing in Newfoundland.

St. Johns, N. F., Jan. 30.—*Editor Forest and Stream:* The trouting season opened on Jan. 15, and although the ice was not very strong on the lakes, many eager anglers were out the first day, and some very good catches were reported. Two ardent fishermen who tried in Pennies River, which is almost in the town, were reported for twenty dozen fine Loch Leven trout. Good catches were also made in other ponds in the suburbs.

W. J. Carroll.

Some News and a Little Gossip.

There is every likelihood of the challenge of the Rochester Y. C. for a race for the Fisher cup, now held by the Royal Canadian Y. C., being accepted, although there are same members of the Canadian organization who do not like the wording of the Rochester challenge. One Canadian is quoted as saying: "It looks to me as if the Rochester people were asking too much. As defenders we have the right to name the class in which the race is to be sailed. They not only ask us to accept the Canada cup boats of 1907 as the class, but they fix the time for the race for the Exhibition for the first week in September. I understand Addison G. Hanan, who won the Canada cup for them in 1907, will be sailing a schooner until Aug. 30. Their choice of a September date may be a coincidence or it may not."

This yachtsman voiced the sentiments of many members of the Canadian Club, but it is probable that this is only telling that the wording of the challenge was not quite to their liking, and that it will be accepted and a race arranged. Another member said:

"Oh, give them a race anyway! Seneca has been beaten by our Crusader before now, and even with Hanan at the helm, we'll give them a wrestle."

It is not at all likely that Addison G. Hanan will take part in this race. In fact, the Rochester men have almost decided that one of their home sailors shall handle the Seneca.

There seems to be some doubt as to the origin of the Fisher cup. According to the Rochester Y. C., the trophy was presented to the Chicago Y. C. in 1882 by A. J. Fisher as a challenge cup, and has been won as follows: 1882, Cora; 1883, Atlanta; 1884, Norah; 1892, Onward; 1900, Genesee; 1906, Zoraya.

According to the Canadian Club the cup was won on the Atlantic Coast in 1874, or about that time, by the yacht Cora. Cora was a 60-foot waterline sloop and was purchased by Commodore J. K. Barker, of Detroit, and taken to the lakes. Commodore Barker was drowned while going ashore in Cora's dinghy with a load of ballast while the yacht was being stripped.

When Cora went to the lakes she was one of the crack American yachts and the Canadians were anxious to have a brush with her with the Annie Cuthbert, owned by Alexander Cuthbert, of Cobourg, who was responsible for the America's Cup challengers Countess of Dufferin and Atalanta. The Annie Cuthbert and Cora

sailed a series of races at Put-in-Bay at the head of Lake Erie and also in Lake St. Clair in the season of 1875, and it was then, according to Canadian tradition, that the Fisher cup was first won by a Canadian yacht. Annie Cuthbert was purchased by Commodore Prindiville and other Chicago yachtsmen, and the cup, which so far belonged to the winning yacht, went to Chicago.

In 1883 the Canadian sloop Atalanta, which made an unsuccessful bid for the America's Cup in 1881, was sent to Chicago in 1883, and won the trophy back to Canada. Atalanta was then owned by the Gifford syndicate. The next year the yacht Norah, of Belleville, owned by John Bell, won the cup from the Atalanta. Norah held the cup for many years. Toronto yachtsmen tried to capture the cup with N. B. Dick's Zelma in 1891. Efforts to arrange a match with the Bay of Quinte Y. C., in which Norah was enrolled, were futile. Then the Rochester Y. C. challenged and in 1892 Onward sailed against Norah. There were practically no restrictions. The race was sailed in a gale, and a big crew was carried on Onward and she defeated the Canadian yacht. Then Zelma raced at Charlotte. Two races were sailed in light winds, and the yachts did not finish, and the third day there was a gale, so that neither yacht could tow out of the harbor. This was in 1893. The cup stayed at Rochester for seven years, when the 35-footer Minota was sent after it after a long series of trial races against the Beaver. The Rochester club defended with the Genesee. Minota was beaten in the first race in light winds, and in the second, when she was leading in a stiff wind, Minota parted a main shroud turnbuckle and had to withdraw. In 1896 the Zoraya easily defeated the Iroquois in two races and took the trophy to Toronto.

In 1895, J. R. White, Arthur T. Hagan and Fred. S. Todd, owners of the Onward, donated the trophy to the Lake Yacht Racing Association on condition that it should be a perpetual challenge trophy for yachts in the 35-foot class and larger belonging to Lake Ontario yacht clubs enrolled in the association. The cup is held not by the winning yacht, but by the club it represents.

The Manchester Y. C. has elected C. Howard Clark, Jr., Commodore; Henry S. Grew, 2d, Vice-Commodore; Francis M. Whitehouse, Rear-Commodore; Arthur W. Merrian, Secretary; Francis W. Fabyan, Treasurer; David Fenton, Measurer; John H. Storer, Member of Executive Committee; Charles E. Hodges, George W. Mansfield, Reginald Boardman, John H. Storer, Jr., and Richard B. Wigglesworth, Regatta Committee.

The Barrington Y. C., at its meeting last week, elected these officers: Commodore, Arthur L. Smith, owner of the 18-foot knockabout Nada; Vice-Commodore, N. Howard Easton, who is having a new motor boat built; Rear-Commodore, Horace L. Manchester; Secretary and Treasurer, Joseph A. Miller; Board of Directors, Charles H. McKenna, Frank O. Field, Charles F. Fairbrother, Harry M. Smith and George Gladding. Commodore Smith announced these appointments: Fleet Surgeon, Dr. Emery P. Sweet; Fleet Captain, Fred H. Bishop; Regatta Committee, Ernest J. Lyons, A. B. Tingley, Richmond Fales, William P. Cross, Albert M. Gardner, Samuel F. Bowden and Alfred L. Atwater; Measurers, Albert C. Davis and G. Lawton Spencer.

The Corinthian Y. C., of Philadelphia, is growing very strong with racing yachts, and the purchase of the sloop Dorello by W. Barklie Henry adds another to the fleet that should win many prizes this year. Commodore E. Walter Clark owns the Irolita, formerly the Queen; C. Howard Clark owns the Savarona; two first class schooner, and in the smaller schooner class there is the Dervish. The Dorello was designed by George Owen in 1908. She attracted some attention because she was knockabout rig, that is, had no bowsprit, but carried in her races a club topsail. She holds the record for the Isle of Shoals and Cape Elizabeth races and has won many prizes.

Eastward will not be the name of the Plant schooner after all. That report was started by some wit at Bristol, who seemed to think Eastward against Westward would sound odd. Commodore Morton F. Plant named his big steamer Iolanda after the Italian princess Yolande, and he recently wrote to the King and Queen of Italy asking permission to name his new racing schooner in honor of the Queen. He has heard from the Royal household of Italy granting him permission to use the name and expressing the thanks of the King and Queen for the compliment. The yacht will be named Elena.

Capt. Harry P. Haff is to be the skipper of Westward. He will succeed Capt. Charles Barr, and leaves here shortly to bring the yacht home and fit out for the season's racing.

Capt. Harry P. Haff, the eldest son of the late Hank Haff, the skipper of Colonia, Defender and Independence of cup defense memories, is no stranger on the shores of Narragansett Bay, for he was sailing master for United States Senator-elect Henry F. Lippitt many years on board diffcrent racing yachts.

He made his mark in the racing game long ago. He spent years on board the famous sloop yacht Wasp, a Herreshoff-built craft that Mr. Lippitt sailed, winning a deckload of cups along the racing highways of the Atlantic Coast. When Mr. Lippitt acquired the schooner Quisetta, Capt. Haff was found on the deck of that craft in charge of the sails, and again when Mr. Lippitt had the sloop Weetamoe built at Lawley's in Boston. So for many seasons his stamping place was on board of Rhode Island owned yachts.

A native and a resident of Islip, Long Island, N. Y., Capt. Harry P. Haff, was of a family of racing skippers, the best-known being his father, the late Capt. Hank Haff, who had an international reputation, as he sailed the Vigilant in Europe in 1893. He is a man of good judgment and keen in his jockeying for positions at starts, and ought to prove a valuable man for Mr. Cochran on board the Westward. His knowledge of the tides and currents of the Atlantic Coast is equal to that of the late Capt. Barr, with whom he had many a sailing scrap twenty years ago, one being on the Wasp and the other on board the Gloriana.

About four years ago Capt. Haff became interested in politics and although not a representative at the State Capitol of New York at Albany, he spent much time there in the interest of his particular section of Long Island. His work was so much appreciated in the lobby that he was soon appointed Fish Warden, which position he now holds and probably will cleave to as well as being skipper of the Westward, for when the yacht racing season is over the duties attached to that of fish warden require more attention than they do in the months of summer.

With Capt. Bill Dennis in the new Elena, ex-Commodore Plant's schooner, and Capt. Haff on the Westward next season, interest will not lag in the schooner classes, for both men are skillful and enjoy the confidence of the yachting community.

The trustees of the Seawanhaka-Corinthian Y. C. have made the following nominations for officers and committees, and they will be submitted to the members at the adjourned annual meeting on Feb. 28: Commodore, Frank S. Hastings, ketch Peggy; Vice-Commodore, Edward F. Whitney, steamer Arrow; Rear-Commodore, Daniel Bacon, sloop Avenger; Secretary, Everett Dominick; Treasurer, Colgate Hoyt, Jr.; Measurer, John Hyslop; Trustees (class of 1914)—James A. Blair, Jr., Francis G. Stewart, Clinton Mackenzie; Regatta Committee—C. Sherman Hoyt, Eliot Tuckerman, Victor I. Cumnock, Franklin Remington, Geo. E. Roosevelt; Committee on Lines and Models—John Hyslop, Walter S. Gurnee, Jr., Robt. L. Cuthbert; Law Committee—Wm. A. W. Stewart, Eliot Tuckerman, Alfred Ely, Jr.; Committee on Seamanship and Navigation—Arthur Curtiss James, Stewart Waller, George Nichols, Francis G. Stewart.

A yacht club has been organized at Cambridge, Md. There were 81 charter members, and it is expected there will be 150 at the next meeting. The officers elected are: Commodore, Alfred I. Dupont; Vice-Commodore, Frank M. Dick; Rear-Commodore, William Rayner; Secretary, Hazeltine A. Joyce; Assistant Secretary, Earl Hearn; Treasurer, Robert H. Matthews; Board of Governors, the Commodores, John G. Hurley, George W. Woolford, John G. Mills, Albanus Phillips, Ivy L. Leonard and Senator Isidor Rayner.

Commodore Dupont owns a magnificent landed estate in Neck district and has already done a great deal to stimulate interest in yachting here. Last fall he gave handsome prizes for a series of races on the Choptank. Next summer he is expected to be here with his steam yacht and to again add zest to the sport. A regatta will be held some time during the summer. Mr. Dick is a New York broker and owns Hambrooks Manor, the old Henry home, near Cambridge. Mr. Rayner has a handsome summer home at Clinton Place, near Cambridge.

The 31-rater Mavourneen has been sold by George Lee to E. M. Mills, of Chicago. Recently there has been a movement among the yachtsmen of the lakes for a class of rating yachts and the Mavourneen will be the nucleus around which the class will be formed. This does not mean that George Lee will be out of next season's racing in Massachusetts Bay, as he has ordered another Class P racer from George Owen, which will be built at East Boothbay, Me.

At the recent annual meeting of the Annisquam Y. C. the following officers were elected for the 1911 season: Harry H. Wiggin, Commodore, John M. Whittemore, Vice-Commodore; Benjamin A. Smith, Rear-Commodore; Walter O. Adams, Secretary; William H. Pear, Treasurer; Hollis French and Paul Tappan, Directors; Walter Olsen, Measurer; Walter O. Adams, Benjamin A. Smith, Harry Friend, Sherburne Wiggin and Stanley Prince, Race Committee; John M. Whittemore, Benjamin A. Smith, C. Fred Pierce, Walter O. Adams and William H. Pear, Membership Committee.

The Quincy Y. C., last week, elected Ira M. Whittemore, Commodore. Other officers elected were: Henry S. Crane, Vice-Commodore; Frank F. Crane, Rear-Commodore; John O. Hall, Secretary, George S. Morse, Treasurer; Ralph E. Winslow, Measurer; Herbert W. Robbins, Eben W. Sheppard, Joseph L. Whiton, Jr., and Harry E. Winslow, Executive Committee; Edgar W. Emery, F. W. Easterbrook, Thomas E. Furnald, W. S. Hardwick, William J. Hudson, Fred E. Tupper and Edward M. Graham, House Committee.

Commodore Whittemore has been a member of the club for fourteen years and is an enthusiastic racing yachtsman. During his membership he has been part owner of the Hustler with the retiring commodore, Herbert W. Robbins, and he also has been the owner of the Tantrum, Marvel and Almira. His present boat, which he raced last season, is the Dartwell, which will become the flagship of the Quincy Y. C.'s fleet.

A business session followed the election of officers. Col. Francis V. Abbott, U. S. A., the commanding officer of the U. S. engineers of this district having in charge the dredging of the rivers and harbors, was made an honorary member.

The report of the secretary gave the present membership of the club as 423, thus showing a net gain of 68 during the year.

It was voted to limit the club membership to 600 and to join the American power boat association.

New Rochelle Y. C. Dinner.

It must be an immense amount of satisfaction for clubmen to be able to dine together and to feel that their pet organization is prosperous, has done good work for the particular sport it supports, and that as an organization it does not owe a cent in the world. So many of the larger yacht clubs can show that the club is successful, that it is keeping its head above water, that is, that it is not falling behind—but these are often so loaded with debt that it seems only a question of time when they must fail.

The members of the New Rochelle Y. C. gathered at the Hotel Manhattan last Saturday for the annual meeting, and the reports of the officers and committees were such glowing ones, that they made the annual dinner, which followed the meeting, a most happy one and the most successful in the history of the club. Secretary C. A. Marsland, in his report to the members, showed that there are now 246 members of the club. This is twenty-nine more than there were a year ago. During the year 71 new members were elected, but some were lost through death and resignations. The club fleet numbers 110 yachts, which is larger in proportion to the membership than that of any yacht club in this vicinity, and the majority of these yacht owners are racing men, too. Echo Bay is a deligtful harbor for yachts of all sizes, and during the season from early spring until late fall the vessels of this fleet fill that harbor.

The treasurer, in his report, showed that the club had spent considerable money during the year, as all clubs must, but in spite of this, after all bills had been paid, there was a balance of more than $1,700 in the treasury.

The report of the regatta committee showed that the New Rochelle Club is a yachting organization in fact and not only in name. The committee is made up of active yachting men, who own and sail yachts, and they know better than others what racing yachtsmen want. G. P. Granbery is the chairman, the other members are M. S. Kattenhorn and W. H. J. Ehler. In his report, Mr. Granberry said: "There were held by the New Rochelle Y. C. during the season eleven races, namely, spring regatta, Cornfield Lightship race, annual cruise, annual regatta, special race for sail yachts and for power boats to Lloyd's Harbor. These two last-named held in conjunction with the Huguenot Y. C. The race for the Waterway League championship was held under the auspices of the New Rochelle Y. C. The total number of starters in the various races is 186, of which there were 50 in the spring regatta, 40 in the annual cruise and 60 in the annual regatta. The total number of prizes is 62. A prize was awarded for each day's run on the cruise and also a series prize for the greatest total points for the entire cruise.

"The value of the prizes was $850, and for this amount $470 was subscribed by the members. The committee desires to thank those who so generously contributed to the prize fund, also to Mr. H. L. Stone, of Yachting for the handsome trophy which he provided for the Cornfield Lightship race; also Commodore B. R. Stoddard for a cup offered in the power boat race, and Commodore George F. Lewis, of Huguenot Y. C., for a cup donated for a special sailing race. We wish to thank Commodore Houck and Mr. C. A. McGill for their kindness in placing their yachts at the disposal of the committee on various occosions.

"Your committee takes pride in calling your attention to the steady increase in popularity of the New Rochelle Y. C. regattas, as evinced by the new records made for number of yachts starting. More yachts participated in our annual regatta than in any race held during the season by any other club on Long Island Sound with the single exception of the Larchmont Y. C.

"Among the victories won by yachts of the New Rochelle Club were: The ocean race for Brooklyn Y. C. challenge cup, won by sloop Waialua, Mr. H. L. Stone; the Harlem Y. C. Stratford Shoal race, won by sloop Crescent, M. A. B. Bill, and the Waterway League championship, won by sloop Rowdy, Mr. H. S. Duell.

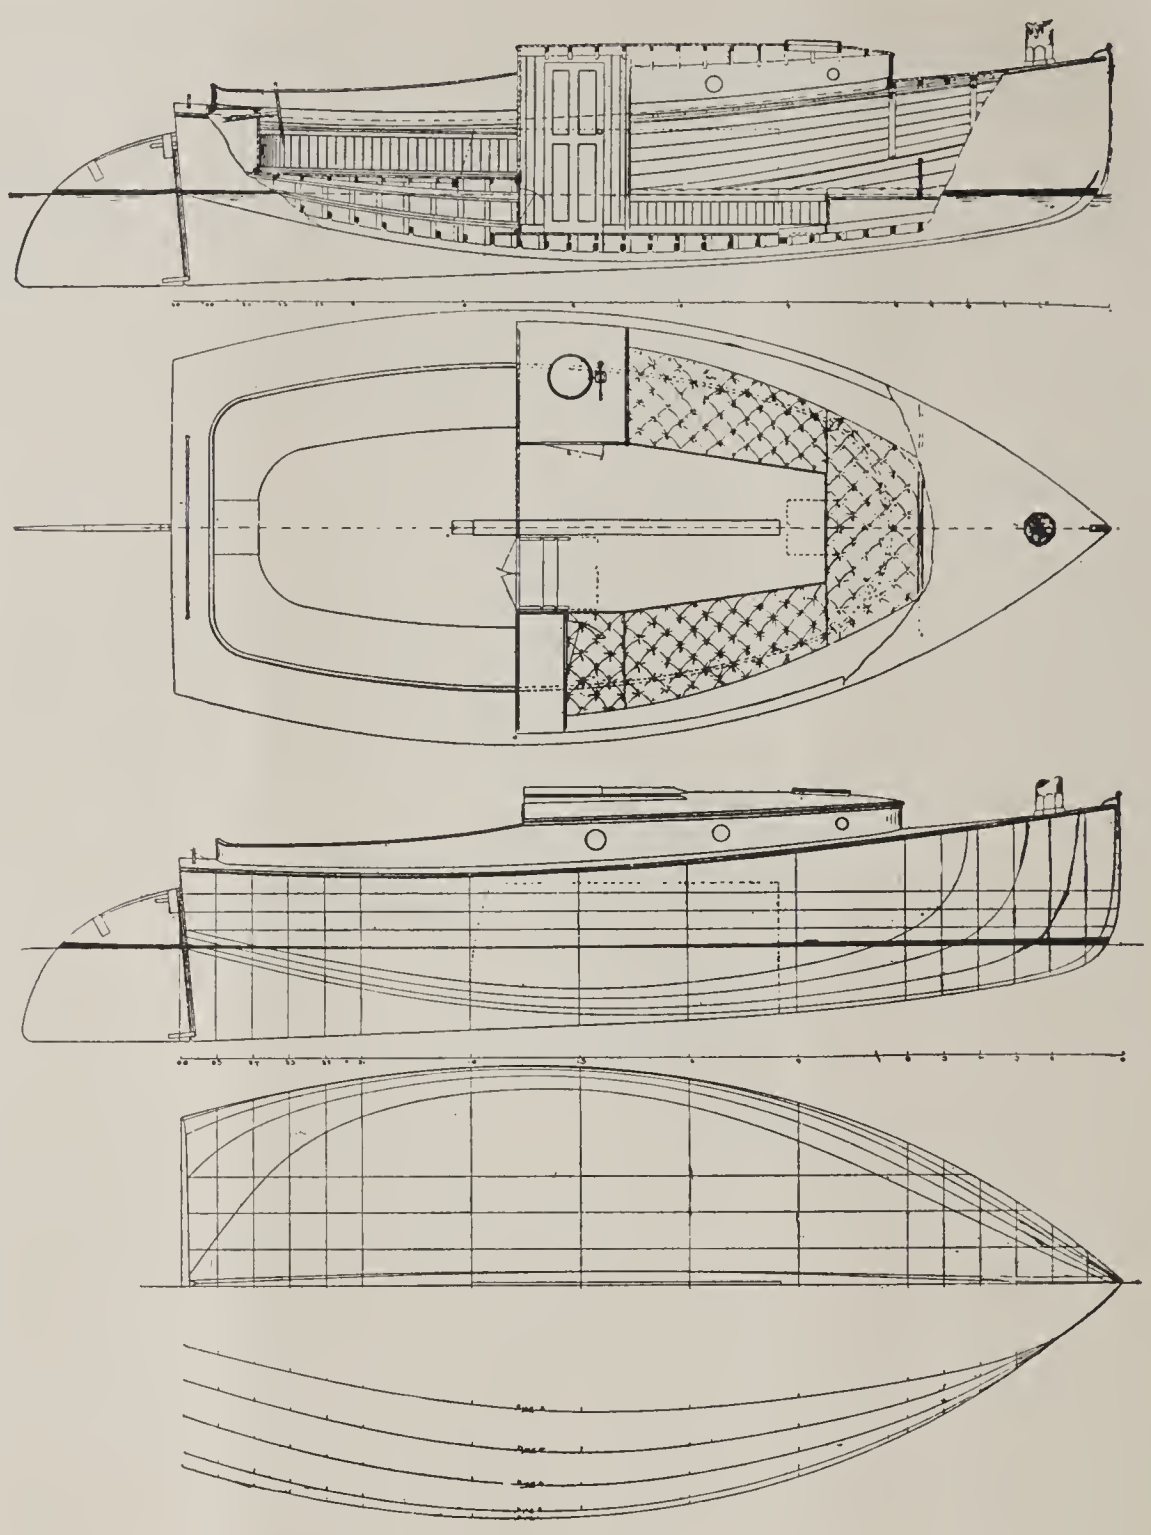
"In almost every regatta during the season the New Rochelle Y. C. was well represented, and on one occasion, when the weather was so boisterous as to cause a postponement of a certain annual regatta, there were only seven boats at the starting line, and of these five were from the New Rochelle Y. C. The ardent enthusiasm of its yacht racing members has earned for the New Rochelle Y. C. a reputation of being not a social, country or automobile club, but a real live yacht club."

The election of officers resulted as follows: Commodore, E. C. Myrick; Vice-Commodore, S. C. Hunter; Rear-Commodore, C. A. McGill; Secretary, C. A. Marsland; Treasurer, C. E. Salter; Measurer, R. M. Haddock; Trustees, Arthur H. Titus, Augustus P. Bennett and Lewis R. Smith; Regatta Committee—G. P. Granbery, A. E. Eldredge and M. S. Kattenhorn; Law Committee—J. F. Lambden, chairman, and C. W. Voltz; Art Committee—Henry M. Lloyd, chairman, and Henry Doscher; Entertainment Committee, E. R. Leaycraft, chairman, and William J. Clark; Nominating Committee—M. W. Houck, chairman, and F. W. Isenbarth and H. J. Meyer.

Commodore Houck presided at the dinner which followed the meeting. It was a most enjoyable affair. About 150 members of the club were present and speeches were made by the new Commodore E. C. Myrick; Commodore Gillespie, of the Stamford Y. C.; Commodore E. A. Sanford, Huguenot Y. C.; Commodore F. B. Bragdon, Harlem Y. C.; Commodore H. A. Jackson, Jr., New York A. C., and C. E. Colwell, the Mayor of New Rochelle.

Commodore Jackson presented to the club the Brooklyn challenge cup won last year by Waialua, and later it was announced that already a race was assured for that trophy for the coming season, as a challenge had been received from the American Y. C., which named the Rowdy, a 30-foot sloop owned by H. S. Duell. It is probable that five or six yachts will start in this race next July.

The members are determined that the season record shall be better than that of last year, and every one was delighted with the success of the club, the meeting and the dinner.

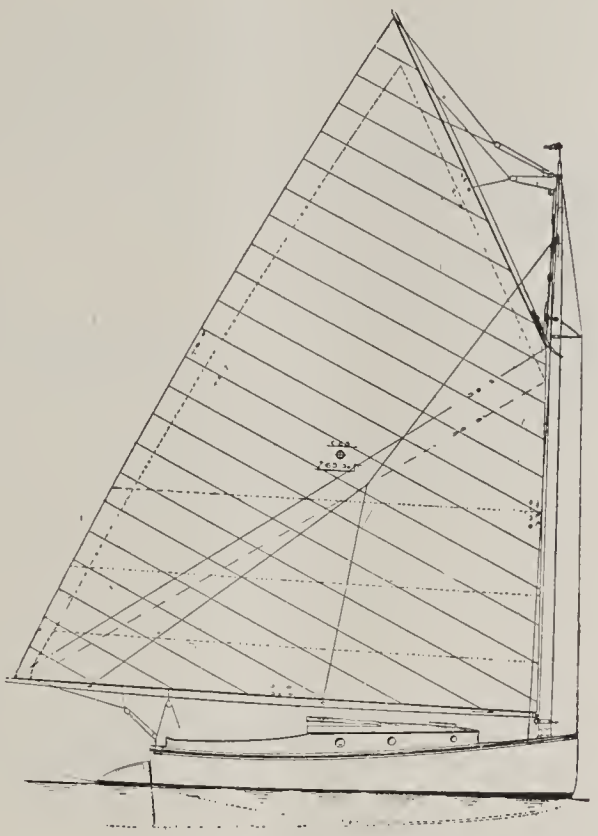


CABIN PLANS AND LINES OF CATBOAT VIRGINIA.

The Catboat Virginia.

LAST year the catboat Virginia was built from designs by Charles D. Mower to take part in the inter-bay catboat races sailed on Narragansett Bay. The boats for these races have to conform to certain requirements, and these are framed to develop a wholesome seaworthy type of yacht. The class is growing popular, and in time it should be one of the most popular along the coast.

Virginia, as the plans show, has good accommodation, as there is nothing freakish in her model. She represents all that is good in the catboat. Her dimensions are 26 feet over all, 25.37 feet waterline, 12 feet beam and 2.58 feet draft. She spreads 765 square feet of canvas.



SAIL AND RIGGING PLAN.

Southern Y. C.

NEW ORLEANS, La., Jan. 27.—*Editor Forest and Stream:* The annual meeting and election of officers of the Southern Y. C. will take place on Feb. 9. The members will meet in a few days for the purpose of nominating a ticket. The club is in good condition and a number of new members have been enrolled recently. The club headquarters at West End have undergone many improvements during the past year. As soon as the officers are elected, the regatta committee will be appointed for the purpose of arranging a program of races for the coming summer and early fall. It is expected that the motor boats will take a leading place in the regattas. While there are many lovers of the sailing craft in New Orleans, still it is admitted that the sailing craft do not attract the public as in years past. It is said that one reason for this loss of popularity is to be found in the fact that very few new sailing boats have been added to the fleet at West End or in those waters, and the people are rather tired of seeing the same old boats year after year. Another cause is attributed to the great interest the public is taking in automobiles, motor boats, aeroplanes and other comparatively new amusements. A sea wall is now being constructed at West End and extensive improvements made, and for that reason the amusement resort for the public here will be at Spanish Fort this summer, a few miles from West End.

Mayor J. S. Montgomery and Harry Montgomery and their wives are in this city stopping at the Grunewald Hotel. They left their yacht Gitana at Vicksburg on account of the breakdown of the machinery. The boat was operated from Georgetown, Ky., to Vicksburg. The original plan was to go down the Ohio River to the Mississippi and thence to the Gulf of Mexico and finally to Havana, but the latter trip has been abandoned. It is thought that Gitana is most too small to venture out in the Gulf. The boat is a gasolene yacht and the gasolene tanks are of not sufficient capacity for a long cruise to Havana. The boat will be brought by river to New Orleans and shipped by rail to Florida where the Montgomerys will spend several weeks. Gitana will be used for inland and near-shore cruises in Florida. The Montgomerys will sail for Havana from Florida, leaving their yacht in some Florida port to await their return. They report a pleasant trip.

Motor Boating.

New Deed for Motor Trophy.

After the last race for the British International trophy off Larchmont, when Dixie II. defeated Pioneer, owing to an accident to the latter, British and American yachtsmen agreed that the deed of trust governing the trophy needed amending. To do this it was necessary for the holders of the trophy, the Motor Boat Club of America, the British Motor Y. C., as trustees of the trophy, and Lord Northcliff, the donor, to confer and arrange a new deed, and it was understood that as soon as the new deed was approved the British would challenge.

Commodore H. H. Melville, of the Motor Boat Club of America went to London with power to act for his club and a new deed has been framed. It is as follows:

1. The trophy shall be for International competition, and the trustees of the trophy shall be the Royal Motor Y. C. of Great Britain.

2. The trophy shall be competed for in every year, and at such time and place as hereinafter appears.

3. There shall be not more than three boats representing each country.

4. Boats representing a country shall be selected by the recognized club of that country. The recognized club of Great Britain and Ireland shall be the Royal Motor Y. C.; the recognized club of France shall be the Automobile Club de France; the recognized club of Germany shall be the Kaiserlicher Y. C.; the recognized club for the United States shall be the Motor Boat Club of America. If there be any dispute as to what is the recognized club of any country other than those named above for the purposes of this race, the trustees shall decide, and their decision shall be absolutely final.

5. Each competing boat shall be constructed wholly in every respect in the country which it represents.

6. No limitation shall be placed on the form or description of the motive power employed, provided that the motive power is wholly mechanical, and also providing that its propelling mechanism acts only in or against the water.

7. Each boat shall carry not less than two hands, of whom the helmsman shall be a member of the competing club, and all hands shall be natives or naturalized subjects of the country which they represent.

8. The recognized club of the country holding the trophy for the time being shall make all the necessary arrangements for the holding of the race, and shall bear the cost relating to such arrangements.

9. The race shall be run under the Racing Rules of the Association Internationale de Yachting Automobile, except that where the said racing rules conflict with these conditions, or with the rules hereinafter set out, or with any modification of such rules made hereafter, the latter shall prevail.

10. Rules affecting the conduct of the race and restricting the length and nature of the course, the measurements and equipments of the boats, size or horsepower of the engines, and all such rules and regulations as are necessary for the proper conduct of the race shall be settled by a committee composed of one representative of the Royal Motor Y. C., one representative of the donor, and one representative of each of the recognized clubs of the countries which competed in the last previous race for the trophy. In the event of any alteration in the rules being required or necessary, such alterations shall be made within three months of the last race, or before a challenge has been received by the country holding the trophy, whichever period shall be longer. No alteration shall be valid unless agreed upon unanimously by the members of the committee, except where the only objector is the representative of the country holding the cup, in which case the question shall be referred to the donor or his representative for the time being present at the meeting of the committee, whose decision shall be final.

11. All questions and protests arising out of the running of the races shall be dealt with by an International Commission composed of one representative of the recognized club of each country competing in the race, and one representative of the donor. In the case of an equal division of votes, the representative of the donor shall have a casting vote. The proceedings of the International Commission shall be conducted in the English language.

Sparks.

William J. Deed, Jr., naval architect, has designed a midship cockpit cruiser for a resident of Henry, Ill., which will be built by the Adams Shipbuilding Company, Boothbay, Me., and will be used at Linnekin's Bay and around Boothbay Harbor, Me., the coming summer. The boat is novel in its construction and design and will be equipped with a 20-horsepower Ralacco engine supplied by Mr. Moore, who is the selling agent for this type of engine. The new boat will be 37 feet long, 9 feet beam and will have a draft of 3 feet.

William J. Deed, Jr., reports the following orders for designs: A 40-foot whaleboat, cruising and fishing boat for Howard Carwick, of New York; a 32-foot auxiliary yawl for A. N. McCool, of Chicago; a 32-foot cruising auxiliary sloop for E. L. Brown, of Boston, and a 28-foot power cruiser for C. Frank Moore and L. L. Borden, of this city.

The Percival cruiser building at Graves' Yard, Marblehead, from A. P. Homer's designs, is being rushed and will probably have its trial trip early in April.

C. Frank Moore, of Boston, has started a plan to form a power boat association along the line of the New York Motor Club. The idea of Mr. Moore is to have this organization consist of owners of all types of power boats in New England and have the organization be powerful enough to compel recognition in national events. Mr. Moore desires owners of power boats, regardless of what clubs they now belong to write him at 220 Devonshire street, giving him their ideas in order that plans may be made at once toward permanent organization. Races will be held in such localities as Provincetown, Portland. Portsmouth, Bar Harbor and on some of the Maine and New Hampshire lakes if the plan meets with the response it needs. Quite a few prominent owners of power boats have already favored the idea, and Mr. Moore wants to hear from big and little alike.

The Crescent Motor Club has elected the following officers: Commodore, G. E. Dodge; Vice-Commodore, Warren Hapgood; Rear-Commodore, Amie Bissell; Fleet Captain, Charles Webster; Treasurer, H. G. Collins; Recording Secretary, F. H. Palmer; Financial Secretary, B. C. Williams.

The members of the Detroit Motor Boat Club elected the following officers: Commodore, William E. Scripps; Vice-Commodore, Fred R. Still; Rear-Commodore, Robert Keller; Secretary, George W. Graves; Treasurer, G. H. Kirchner; Fleet Captain, Lewis Newberry; Fleet Surgeon, Dr. W. H. Price; Measurer, Eugene M. Emmons; Quarter Master, Arthur M. H. H. Von Jasmund.

Robert J. Reddy, secretary of the Frontenac Y. C., of Frontenac, N. Y., announces that the 1911 race for the American Power Boat Association gold challenge cup will be held over the triangular course of the Frontenac Y. C., at Frontenac, on Aug. 8, 9 and 10. The course is seven miles in length with very easy turns and is free from shoals and other obstructions. It lies directly in front of the club house, and the racing boats will be in sight from start to finish. The cup was won last year by Dixie II., owned by F. K. Burnham, representing the Frontenac Club.

Cruiser for H. P. Scott.

Henry P. Scott, of Wilmington, is having a cruising motor built by the New York Yacht, Launch & Engine Company, at Morris Heights, from designs by Cox & Stevens. The principal dimensions of this yacht are: Length over all, 65 feet; beam, 11 feet 8 inches; draft 4 feet 2 inches. Mr. Scott wanted a vessel as seaworthy as possible for these dimensions and a vessel with good cruising accommodations. The model selected is the plumb stem type of hull. The sides amidships are carried up, giving a flush deck the full width of the vessel for about one-third of her length. Aft of this raised deck is a trunk cabin which gives full headroom and good light and ventilation for the quarters below. This trunk is rather narrow, and so gives lots of deck room on each side. Forward of the raised deck portion there is a sunken house in which is the dining room. The deck forward of this has a heavy crown.

The owner's quarters are in the after part of the vessel. Just aft of the engine space is a stateroom the full width of the yacht which opens at the after end into a lobby from which access is had to the upper deck by means of a companionway on the starboard side. The lobby itself may be used as a stateroom. On the starboard side opposite the lobby is a bath room. Under the cabin trunk is another double stateroom which extends the full width of the yacht. The finish below will be Colonial. Aft of the forecastle and under the dining room is a space for water tanks and stores.

The yacht will be driven by two 30-horsepower Twentieth Century motors, and the engine space is separated from the rest of the yacht by watertight bulkheads. This yacht is to be named Lexington II., and will be delivered in the spring.

New Boats by Whitaker.

Morris M. Whitaker, naval architect, of New York city, reports the following orders for designs booked during the month of January, 1911:

High speed cruiser, 60 feet by 8 feet, for St. Petersburg, Russia, equipped with a 6-cylinder 40 horsepower Standard motor.

High speed day cruiser, 60 feet by 9 feet, for Pacific coast owner, equipped with two 6-cylinder 65 horsepower Sterling motors.

Raised deck cylinder, 45 feet, for a Pacific coast owner, equipped with a 4-cylinder 6 by 9 Holmes motor.

Raised deck cruiser, 38 feet by 9½ feet, equipped with two 18-25 horsepower Sterling motors for a Pacific coast owner.

Raised deck cruiser, 60 feet by 13 feet, equipped with a 6-cylinder 6 by 9 Holmes motor for a Pacific coast owner.

Deep sea cruiser, 75 feet by 15 feet, equipped with two 50 horsepower Ralaco motors for use on Lake Superior.

Auxiliary ketch, 67 feet by 18 feet, for New York city owner.

Raised deck cruiser, 36 feet by 8 feet 6 inches, to be built by Gage & Schuchard, of Nyack, N. Y., for a New York city owner.

Auxiliary ketch, 25 feet 6 inches by 8 feet, equipped with a 8 horsepower Standard motor for a Connecticut owner.

Thirty-two-foot runabout, equipped with a 6-cylinder 2-cycle motor, for a New York city owner.

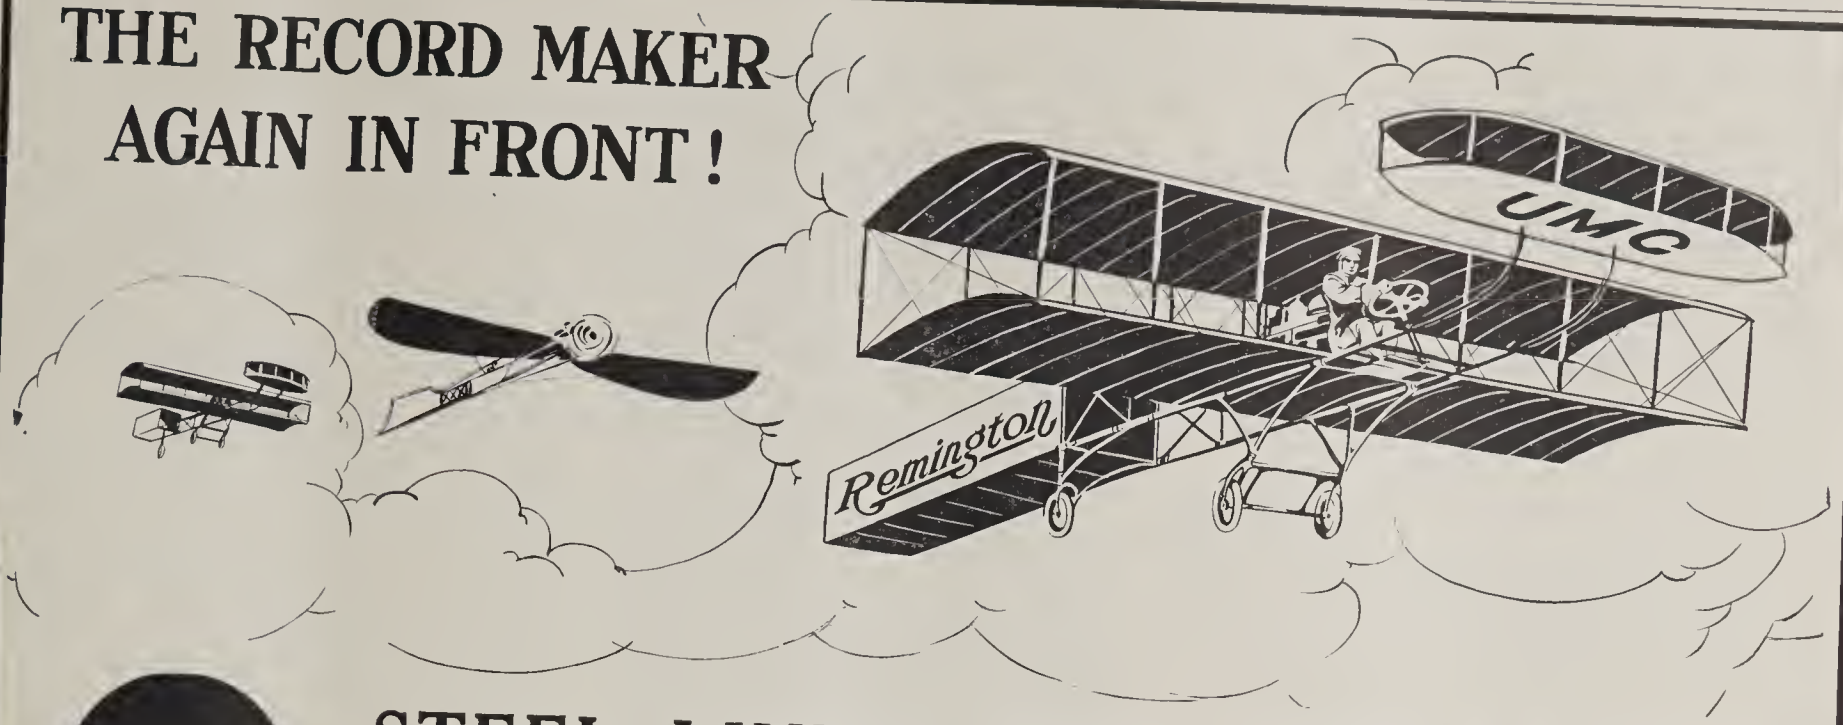
Raised deck cruiser, 40 feet by 9 feet, equipped with a 4-cylinder 30 horsepower Fay & Bowen motor for a Philadelphia owner.

Two 35-foot runabouts, equipped with 6-cylinder Holmes motors, for New York city owners, to be constructed by the Holmes Motor Co.

The aggregate value of these boats will be $85,000.

In addition, Mr. Whitaker has closed up during the latter part of 1910 for use during 1911 thirteen motor boats varying in size from a 25-foot runabout to a 55-foot high speed day cruiser with an aggregate value of $46,000.

THE RECORD MAKER AGAIN IN FRONT!



REMINGTON UMC

STEEL LINED SHOT SHELLS WIN PINEHURST MID-WINTER HANDICAP

Pinehurst, N. C.

Charles H. Newcomb, shooting Remington-UMC Steel Lined Shells, tied for first place and then won in the shoot off. W. T. Laslie, shooting Remington-UMC Steel Lined Shot Shells, won the **Preliminary Handicap.**

AT THE SUNNY SOUTH SHOOT, Houston, Texas

High General Average, won by Guy Dering with a score of 92¾%, shooting Remington-UMC Steel Lined Shells.
Chronicle Trophy, also won by Guy Dering with a score of 96 out of 100, shooting Remington-UMC Steel Lined Shells.
First two High Professional Averages, won with Remington-UMC Steel Lined Shells.

WORLD'S 100-SHOT .22 CALIBRE RECORD

Won by Dr. W. G. Hudson with a score of 2482 out of a possible 2500, with Remington-UMC .22 Short Lesmok Cartridges.

Remington-UMC — the perfect shooting combination.

Sept. 12-16.—Atlantic City, N. J.—The Westy Hogans of America. Bernard Elsesser, Sec'y.

DRIVERS AND TWISTERS.

S. G. Purvis has been elected Secretary of the Butler Gun Club, instead of George J. Elliott, resigned.

The New York State Sportsmen's Association has fixed upon June 13-15 for its tournament, to be held at Syracuse.

Fred C. Whitney informs us that the dates of the Iowa State shoot, for April 18-20 have been withdrawn. Other dates will be claimed later on.

We are informed that "Annie Oakley will head the show coming in April. Have own train, thirty cars, twenty-five horses, two hundred people, buffalo, etc."

Maltby W. Conover, Secretary, informs us that the Freehold Gun Club will hold an all-day shoot on its grounds on Feb. 16, beginning at 10 o'clock. The entrance fee will be $1 each event. There will be eleven 15 target events and one at 25 targets, merchandise, high guns. Free lunch will be provided.

The seventh annual interstate shoot, given by R. S. Elliott Arms Co., at Blue River Park, Kansas City, Mo., Feb. 14-17, has many specially attractive features. There is the great Western Handicap, 25 pigeons, $100 in gold to the winner; the interstate target championship, 100 targets, winner to get cup redeemable at $100; interstate pigeon championship, 25 pigeons, winner gets cup, redeemable at $100; team pigeon championship, five men to a team, winners get cup redeemable at $100. For program address R. S. Elliott Arms Co., 1221-23 Walnut street, Kansas City.

The Cincinnati, O., Gun Club announces a live-bird shoot, to be held on Feb. 16, at Latonia Station, Covington, Ky. This will be a preliminary or practice shoot for the Ohio State championship, to be held on the grounds of the Crystal Lake Gun Club, Feb. 22. Event 1, 20 birds, handicap, $5 entrance, sweepstakes $5, class shooting, 50, 30 and 20. The first 10 birds will constitute event 2, $5 optional. So with the second 10 birds.

The Florida Gun Club opened to-day. Extensive improvements have been made to the club house and grounds the past two months, and everything has been put in the best possible condition. There are now a number of very handsome cups to be shot for in handicaps, the dates for which will be announced later by the committee having that in charge. Boris de Struve, of Russia, in a little match with his friend Mr. Kennard, killed 25 live birds straight standing at 31yds. Kennard killed 19.

Bernard Waters.

Crescent Athletic Club.

Bay Ridge, N. Y., Feb. 4.—The weather conditions were favorable for good scoring at the Crescent Athletic Club traps to-day. L. C. Hopkins, C. Blake, George Piercy and C. H. Pulis succeeded in making straight scores. Hopkins scored a leg on the Stake trophy and for the January trophy. The leg for the Lockwood trophy was won by Blake. George Piercy won the consolation cup, and C. H. Pulis won the sweepstake trophy. The new season cup offered by J. S. Lawson had fourteen contestants. It was won by a score of 23 by A. B. Hendrickson. F. B. Stephenson and J. F. James tied for second with 22. The four best scores of the season will take the trophy.

The conditions of the monthly cup were changed by the shooting committee at yesterday's matches. Every shooter must shoot two strings of targets, 50 in all. Hyatt and Hopkins scored 47 targets out of 50, which will be credited to them at the end of the month.

February cup, 50 targets, handicap, strings of 25:

	Hdcp.	25	25	Total.
F S Hyatt	0	23	24	47
L C Hopkins	10	25	22	47
J F James	2	23	23	46

Dupont Gun Club.

Wilmington, Del., Jan. 4.—It was truly a close race, one of many close ones, between Wm. M. Foord, of Wilmington, and Alan M. Richardson, of Dover, Del. It is not a slow contest by any means when these renowned marksmen engage in a match. The conditions were 100 targets. Foord scored 95 and Richardson 93. The prize was the championship. In the first round Foord scored 25 to Richardson's 23. At the end of the 50th target the scores stood 48 to 46 in Foord's favor. Next 72 to 70 for Richardson. Ed. Banks and H. W. Bush were referees. A match between Foord and Lott for the championship will he arranged probably later.

The complete scores of yesterday were:

W E Ross	12	J Winchester	22
J E Gregg	10	G F Huber	16
R B Evans	17	H S Farrow	11
H Winchester	21	O B Clark	12
T Rogers	18	J T Robeson	18

L B Walters	1	T W Matthewson	20

Another interesting match was between Foord, Lobb and Bush, all of whom had tied for the trophy in Class A on Jan. 21. In the first round, Foord and Lobb made each 23 out of 25 targets, with Bush 22. This was another tie. In the second shoot-off, Foord and Lobb each lost 2 targets, thus resulting in the third tie, which will be decided next Saturday.

A most interesting team race was that between teams representing the sales department and the black powder operating department of the Du Pont Company. It was the intention to shoot ten-man teams, but as only seven of the operators were on deck, the seven best scores made by the salesmen were counted. The operators won by 9 targets, as follows:

Salesmen.		Operators.	
E du Pont	24	F Matthewson	24
W Coyne	19	T W Keithley	22
W A Joslyn	18	V du Pont	22
W S Gavan	17	T W Matthewson.	20
D D Poffenberger.	16	C V Ferriday	17
C C Gerow	16	S B Trott	15
W S Simpson	16	Major Ramsay	15—135
J W Mathews	16		
H R Lindsay	15		
Jas MacMullen	14—126		

In the T. C. Du Pont merchandise event, J. McKelvey won Class A with a score of 25. The other scores were:

Class B: W. G. Ramsay, Dr. L. Rumford, S. G. David, L. C. Lyon, R. A. Vance, A. M. Turner, William Coyne 19.

Class C: W. T. Bickley, W. S. Simpson, D. Lindsay, C. D. Rogers, Gerrow, Poffenberger 16.

Class D: H. S. Pierson, H. S. Farrow 11.

Charles Nelson, of Utica, N. Y., gave an entertaining automatic pistol exhibition. He shot with other shooters who were using the regulation target pistols, and his scores were remarkable.

Mr. Nelson also gave an exhibition of rapid-firing, making scores of 72, 76, 78, 85 and 87 on the 50yd. target, shooting each string of 10 shots inside of that number of seconds. Two thousand people were on the grounds, a large contingent from Dover accompanying Mr. Richardson.

The attraction for next Saturday will be an exhibition race between L. H. Worthington, of Rising Sun, Md., and four members of the local club. The local shooters will be chosen from the best shots on the grounds, and they will shoot all in one squad during the afternoon. One hundred targets will make up the race, with a suitable prize to the high man in the squad. Worthington is one of the best trapshooters in Maryland.

The club was organized on Nov. 10 of last year, by a number of the employes of the E. I. du Pont de Nemours Powder Company, for the encouragement of trapshooting in this vicinity. Membership is not limited to employes of the company; others, in fact, are urged to join and take advantage of the club privileges. Of the 308 members the club now has, 80 are in no way connected with the powder concern.

It is not necessary to be a club member, however, to take part in the shoots. The charges for membership being but $1 a year, with an initiation fee of $2, and the fact that members can secure targets at a cheaper rate than non-members, makes it a decided advantage to affiliate with the club.

The powder company has furnished the grounds at New Bridge, just beyond Rising Sun, across the Brandywine, forthe club and has ercted thereon a cozy little club house. Three traps have been installed, and a pistol and target range with five targets put in. The whole outfit of the club costs in the neighborhood of $2500.

The regular shoots of the club are held every Saturday afternoon, beginning at 1:30 o'clock. T. C. du Pont has given $200 each year for five years, for the purchase of prizes, and the T. Coleman du Pont merchandise event is shot off each week. Four silver spoons, of a plain design and engraved with the club name, are offered each week for the winners of the four classes. In addition, special events and ties left over from previous Saturdays are shot.

Eugene E. du Pont has offered a prize of $50, to be contested for throughout the season. To be eligible the men must have shot at 25 targets 20 times; their ten best scores are selected, and the high man will win. The manufacturers of the Fox gun have offered a $100 double barrel shotgun, to be contested for through the months of February, March, April and May. Like the du Pont trophy, this will also be won by the man getting the highest mark in totaling his ten best scores at 25 targets, but it takes only ten scores to qualify instead of twenty, as in the Du Pont contest.

For the convenience of business men who cannot get out to shoot on Saturdays, there is a regular Thursday afternoon shoot, beginning at 2:30 o'clock. The scores made then count the same as if made at the Staurday shoot.

A charge of 15 cents is made to members of the club for 25 targets, and this, in addition to the cost of the shells, makes an afternoon's shoot at the club inexpensive sport. Non-members pay a cent apiece for the targets.

The following scores were made on the rifle range:

Rifle practice scores, 50yds., .22cal.: David Appleby 71; J. T. Birch, 63, 46; F. Gibney, 61, 31, 31, 29; W. S. Weedon, 60; L. C. Weldin, 55, 37; W. P. O'Connor, 54; J. B. Grier, 51, 38, 37, 36. 31; J. R. Owens, 48, 38, 37; W. Coyne, 48; R. F. Donovan, 45, 32; D. D. Ferree, 45, 39; W. A. McElwee, 46, 35, 29; H. C. Latimer, 43; C. H. Latimer 40; H. F. Schuler, 42, 32, 27; J. I. Burrell, 41; R. P. Fletcher, Jr., 36; W. H. McElwee, 34; H. G. Ely, 31; J. Hunt Holt, 26; John A. Mulligan, 24.

Pistol qualification scores, 50yds.: F. B. Harkins, 76.

Pistol and Revolver practice, 50yds.: Charles Nelson, 82, 78, 76, 62; David Appleby, 70, 69, 53, 45, 47; E. H. Lambert, 39, 36, 35; W. T Sharpless, 31; G. C. Lambert, 26, 19, 10; F. H. Mason, 17, 14; C. S. Hurter 15.

Buffalo Audubon Gun Club.

Buffalo, N. Y., Feb. 4.—Frank Kelsey and Byron Covert divided the honors at the Audubon shoot to-day, each breaking 70 out of 80 targets, and also making the only straight scores. Kelsey also won the Reed trophy from the 20yd. mark, and scored 18.

Covert, going straight in the second event, won Class A badge, and Will Imhoff and Dr. Burke won in their respective classes for the third consecutive time. They seem to he the whole class to themselves.

Several extra events at doubles followed the regular program, and in this particular style of shooting W. H. Hopper was easily the best of the lot, as he broke 16 out of his first 10 pair, and later made the exceptional score of 28 out of 15 pair shot at.

Renn Spaulding was runner-up with 21, and broke his first 5 pairs like a seasoned professional.

Targets:	20 20 20 20	Shot at.	Broke.
F D Kelsey	18 16 16 20	80	70
B V Covert	17 20 16 17	80	70

New York Athletic Club.

TRAVERS ISLAND, N. Y., Feb. 4.—There was a large attendance at the Travers Island traps to-day. Pleasant weather contributed to the sport and good scores added to the enjoyment. The Travers Island handicap was well contested. Six tied on 24. In the shoot-off, P. R. Robinson won with 22 out of 25. There was no challenge round for the tournament cup. E. M. Higgins was absent, and Dr. De Wolfe won the right to challenge in the next weekly shoot.

The first leg on the February cup went to A. E. Ranney, who smashed 25 of the tiny targets. With the same score P. R. Robinson took a leg on the Haslin trophy, and in the distance handicap, Chairman George Corbett, of the shooting committee, had no trouble in winning from the 20yd. mark. G. F. Pelham, with the excellent run of 16 targets, took the weekly shoot at 10 pair of doubles. The scores:

Haslin cup, 25 targets, handicap:

P R Robinson	5	25	L L Lawton	5	21
T Lenane, Jr.	3	24	G L Bready	3	20
E A Wilson	2	23	W B Ogden	2	20

O C Grinnell	20	20			

The Fred Macaulay Business Men's Gun Club.

NEWARK, N. J., Feb. 3.—The Business Men's Club who were to have shot against the eight-man team of the South River Gun Club this afternoon at South River did not put in an appearance on account of the drizzling rain, thick fog and sloppy roads.

The South River Gun Club was on the spot to a man, and with a strong team picked from the best shooters from Matawan, Freehold, South River, Morgan's Station and other towns, but they are members of the South River Gun Club just the same, and they are a hard bunch to beat. In a recent match, shot with another team from that section, they broke 289 targets out of a possible 300, having only 11 misses, so it is expected that they will keep the Macaulay gunners going some to beat them.

Sweepstakes were the features of yesterday's shoot, and Doc Kennedy, of Matawan, the former amateur State champion, ran away with the honors of the day, as well as most of the first moneys. He also had the distinction of smashing 92 targets without a miss. Firm Bissett was next high in the sweepstakes; Applegate, of Matawan, was third, and William Hartman, of Morgan's Station, was fourth. Toward 3 o'clock the fog cleared away and the sun came out, making the shooting ideal. The ten-man team of the Macaulay gunners will meet the ten-man team of Jersey City in the near future.

The members of the Fred Macaulay Business Men's Gun Club, held their regular weekly shoot yesterday afternoon at the Speedway traps in Irvington, and a jolly crowd of shooters they were. The firing line began at 1 o'clock, and sweepstakes were the feature of the day from the time the first gun was fired until dark.

Paul Coffin was high average gunner of the day with 246 kills out of 275. In his first 100 he broke 92. His average was 22 4-11 out of each 25 clay targets shot at. Louis Colquitt was second high average, killing 210 birds out of 250, and he had an average of 21 out of each 25. John Geiger broke 207 out of 250, with an average of 20 7-10 out of each 25, which made him third. Thomas Dukes, of the Orange Gun Club, was fourth, with an average of 20 3-7 out of each 25 shot at. He missed 32 out of 175. H. H. Shannon, of the Jersey City Gun Club, broke 159 out of 200 targets shot at, making an average of 19 7-8, which made him fifth for high average. C. W. Billings was sixth, killing 155 out of a possible 200, making his average 19 3-8.

A cold wind blew across the traps, which made accurate shooting difficult, and it seemed impossible for any one of the shooters to make a clean score of 25 straight, although Carl Von Lengerke, John Geiger and Phil Coffin broke 24 each during the afternoon, and 23s were made often.

A meeting of the club was called at the club house grounds, to take place at the Speedway Tavern last night, but as only a few put in an appearance, another meeting will take place next Tuesday, after the shoot.

The following were the shooters and their scores yesterday:

B M Shanley, Jr.	20	17	18	18	16	..	..	..	..	..	..
Fred Macaulay	11	16	15	..	..	..	..	..	..	..	..

G. W. CHESLEY

Another and Wonderful World's Record

— *Made with* —

WINCHESTER

Rifles and Cartridges

The World's Record of 988 made by members of the Winchester Rod and Gun Club, New Haven, Conn., on January 24th in the Inter-Club Matches, was on January 31st surprisingly surpassed by them. Note the remarkable scores given below:

G. W. Chesley	50	50	50	50	=200
W. H. Richard	50	50	49	50	=199
H. J. Gussman	50	50	50	49	=199
A. F. Laudensack	48	50	50	50	=198
J. W. Landon	50	49	50	48	=197
Total					993

This record is so high that it is hardly probable it will be even equalled in some time. Mr. Chesley's score of a possible 200 is especially noteworthy. Every man in this squad again used a Winchester Single Shot Rifle, .22 Long Rifle caliber, and Winchester Cartridges, again emphasizing the generally accurate and uniform shooting qualities of Winchester goods.

Winchester Rifles and Cartridges Shoot Where You Hold. :: :: ::

Jenkintown Gun Club.

ABINGTON, Pa., Feb. 4.—In the first shoot for the 1911 records, Dr. S. D. Larzelere won high score for the trophy total, while Berk won the club event with 44 actual breaks out of 50 targets. All events were at 25 targets, with the aggreate totals of first two events, totaling 50 targets, comprising the monthly club event. The summaries:

					Broke.	Hcp.	Total.
Cooper	19	15	19	2	—75	16	91
Berk	22	22	21	19	—84	11	95
Pierson	21	20	18	18	—77	14	91
Dr Larzelere	23	20	19	21	—83	16	99
Hellerman	17	12	8	..	—37	24	61
Hiltebeitel	13	13	..	..	—28	15	43
Nash	15	15	..	..	—30	16	46
Myers	6	11	..	..	—17	20	37
Hillpot	23	20	20	18	—81	0	81
Frankenfield	15	11	12	..	—38	0	38
Haas	18	19	18	17	—72	21	93

The FOREST AND STREAM may be obtained from any newsdealer on order. Ask your dealer to supply you regularly.

Hyde Park Gun Club.

Cincinnati, O.—Saturday, Feb. 4, was the first really pleasant week-end for many weeks, and the bright skies tempted a nice bunch of shooters to show up for the weekly shoot. The scores were not up to the average in some cases, owing to a stiff breeze blowing across the traps and causing the targets to perform many puzzling stunts.

The selection of Columbus for the Grand American is already having an effect on the local shooters, and many of them are planning to enter the event, and take a whirl for the big prize. For 85 to 90 per cent. shooters there is a sporting chance that they might win, and we've got a lot around here who mean to take that chance. The Grand American Handicap is bound to be the biggest thing that ever happened, and that over 500 shooters will take part is freely predicted. Ward is not a regular attendant here, but we hope he will come often this season and improve his score by practice, which is all he needs.

Winterburn has never shot at the traps before, but rapidly got the hang of the thing and went from a 4 to 52 per cent. gait in three events. In the first two events he was somewhat handicapped by using his 16-gauge, 28-inch barrel gun.

De Mar did the best work of the day, getting 45 out of the first 50, and finishing the afternoon with 88 per cent.

Holaday was using a strange gun; in fact, he used two or three, and fell down in some of the events.

Frohliger was beaten by the wind, for he seldom ever drops as many targets as he did to-day. Sampson has his eye on that $1000 prize, and he's got more than a fighting chance if he can "come back" with practice.

Irwin is getting the hang of his new gun and will soon strike his old gait again. Welch is a new one in the game; at least he has done shooting for ten years or more until last week. We're glad to see him getting into practice.

Smith has been too busy to shoot for several weeks, but promises to be regular hereafter.

Hoggatt gets around once in a while, but lets too long an interval elapse between his visits. The club will be well represented at the Ohio State championship event on Washington's Birthday.

Holaday	21 16 20 16 16 ..	95
Frohliger	15 13 14 12 13 20	87
Irwin	19 19 22 19	79
De Mar	24 21 21	66
Ward	19 20	39
Hoggatt	15 17	32
Sampson	15 20	35
Welch	10 18	28
Smith	12 13	25
Winburn	1 6 13	20
Richards	19	19

Meeting of the Missouri State Association.

St. Louis, Mo., Feb. 1.—The thirty-third annual meeting of the Missouri State Game and Fish Protective Association was held in St. Louis at the club house of the St. Louis Trapshooters' Association. The officers elected for the ensuing year are: James W. Bell, President; Lee Eichhorn, Vice-President; Louis Ebert, Secretary-Treasurer. The following members were elected on the Board of Directors: Chas. Kohler (Blue Wing Gun Club), J. W. Beck (Tannhauser G. G.), Fred. C. Suhr (Fallstaff G. C.), Fred Otto (San Souci G. C.), F. A. Reinert (Edrus G. C.), Geo. L. Lauth (Central G. C.), N. M. Hobbs (Peerless G. C.), Jos. W. Locatell (St. Louis Trapshooters' Association).

Application for membership have been received from the following gun clubs and approved as members: Sullivan, Sikeston, Cape Girardeau, St. James Gun Club; also the Missouri State Rifle Association at St. Charles, Mo.

The Missouri State tournament for this year will be held at St. Louis, Mo., under the auspices of the St. Louis Trapshooters' Association, on May 18-20.

Application blanks will be mailed any gun club desiring to join this Association by sending request for same to the secretary.

Louis Ebert, Sec'y.

2845 Cherokee St., St. Louis, Mo.

Live Bird Championship of Ohio.

A number of the live-bird shooters of Ohio, including some of the "old guard" of the Cincinnati Gun Club, have asked for a renewal of the Ohio State championship shoot, which was so successful in the old days of that club before live-bird shooting at the traps was prohibited in Ohio. The Crystal Lake Gun Club has taken the matter up, and it is the intention of the club to make this shoot an annual event at their grounds, Ryland, Ky., on Washington's Birthday each year. Only Ohio amateurs are eligible to compete for the championship, but sweepstakes are open to all amateurs. In order that suitable arrangements may be made for the entertainment of the contestants, entries will close on Saturday, Feb. 18. An entrance fee of $5 will be charged each contestant for the championship, the entire amount so collected to be used for the purchase of a sterling silver trophy emblematic of the Ohio championship. Should the entrance money amount to $100 or more, two additional prizes will be given for second and third high guns. The following gentlemen constitute the tournament committee: John A. Payne, chairman; Frank D. Alkire, L. F. Ahlers, Lou Fisher, Col. Max C. Fleischmann, Harry Hake, Dr. A. B. Heyl, Henry F. Jergens, G. W. Schuler, Col. R. H. West, Wm. Webster, H. C. Yeiser, F. H. Kirschner, Henry J. Koch, and Geo. Osterfeldt. The secretary of the club, to whom entries may be made, is R. H. West, Jr., First National Bank building, Cincinnati, O. The committee is sending a personal letter to shooters inviting them to attend a renewal of the Ohio State wingshot championship shoot, to be held on the grounds of the Crystal Lake Gun Club, on Washington's Birthday, Wednesday, Feb. 22. Each shooter will be handicapped by a committee for the first series of 10 birds, after that each man will handicap himself; 10 straight kills, go back one yard for the next 10; 9 out of 10, remain at the same distance; 8 or less out of 10, advance one yard. No shooter to advance nearer than 26yds., nor go back further than 33yds.

The program consists of three events. The first event is at 40 birds, handicap, for the Ohio State championship, entrance, birds, $10.00; sweepstakes $10; class shooting; one money for each five entries. Sterling silver trophy to the winner. The first 20 birds constitute event 2, entrance $10, class shooting. The last 20 birds make up event 3, with the same entrance and division. Entrance in sweepstakes is optional, the contestant being permitted to shoot for birds only, if he wishes. Dinner will be served at the club house at noon. Shooting will begin at 9:30. This shoot has been arranged at the earnest solicitation of a large number of sportsmen, and it is up to them to make the affair a big success by attending themselves, and urging others to do so.

Cincinnati Gun Club.

The live bird shoot to be held on the grounds of the club, Feb. 16, is a sort of preliminary, or practice shoot, in preparation for the Ohio State live bird championship event, which will take place on Washington's Birthday. The program will consist of three events: One at 20 birds, handicap, entrance $10, birds included, class shooting, 50, 30 and 20 per cent. The sweep in this event is optional, contestants being permitted to shoot for birds only if they wish. The first and second 10 birds of the first event constitute events 2 and 3 respectively, with an optional entrance of $5 in each. Other events will be arranged to suit the shooters. The program will be started at 9:30, and an excellent dinner will be served in the club house. The committee in charge of the arrangements is composed of the following well-known sportsmen, and each individual is working hard to make the affair a success: Dr. R. Lee Bird, T. H. Clay, Jr., J. V. Dea, Dr. A. B. Heyl, Col. Max Fleischmann, F. H. Kirchner, Henry J. Koch, George Moerlein, George Osterfeldt, John A. Payne, Dan Pohlar, J. E. Schreck and G. W. Schuler.

Owing to the unfavorable weather of the past few weeks there has been nothing doing at the club grounds; but it is expected that this shoot marks the beginning of a revival in the interest of the members, and that the weekly shoots will be resumed with a good attendance.

Montclair Gun Club.

Montclair, N. J., Feb. 4.—In the contest for the first leg of the members' trophy, to-day, 25 targets, handicap (event 2), Messrs. Frazee and Atwater tied for first place, but in the shoot-off at 25 targets, which occurred in the following event, Frazee did not need the help of his handicap, making 25 breaks, and easily winning out. He was also high man in each of the other events.

The team race scheduled for Lincoln's Birthday, between Orange and Montclair, will take place on Saturday the 11th, inst., instead, some of the Orange boys being unable to attend on the 13th. The Orange team is expected to come over in automobiles ten strong, and will bring over an extra motor car to take home the trophies they expect to capture.

Indianapolis Gun Club.

Indianapolis, Feb. 4.—At to-day's meet of the Indianapolis Gun Club, "How to break targets without an ax" was demonstrated by Mr. Nickel, a visitor from the Fort Wayne Gun Club. Shooting in perfect time, regardless of a high wind blowing across the traps, he took in less than three hours, 219 out of 230 targets, 75 of which were from the 15yd. mark. Mr. H. Heikes, just now recovering from a severe illness, was a bit unsteady for a while, but finished with 71 out of 75 at 18yds. But the feature of the day, perhaps, was the second act in the home-made comedy, "The Proud Professional." At the end of the first act a week ago, the hero was seen carrying away the president's cup, which he had won by his skill in an open contest.

Act. II.—Enter one Barr, a bit chesty, with crest erect, and carrying a long pole bearing the cup and the flaming red defi—"Take it, who can!" This bold front (or was it a bluff?) carried dismay to timid amateurs, and resistance proved but feeble until it remained for Dixon, still without a trophy, to save the day. Loosening his belt, and fortifying himself with another batch of Mrs. Waite's good pies, he winked at the cashier—but why dwell upon details? The summary of scores tells what happened thereafter, except that it was reported that as twilight came on apace—as they say in the story books—the bent and feeble shape of a man, seemingly old, might have been seen wending its way through by paths to the city, and when the little owls came out and said, "Hoot, hoot," the little man said, "Don't Dixon, don't; I can bear no more."

But youth is elastic and will not be denied. What the P. P. will do to some of us will be another story.

R.

Highland Gun Club.

The Highland Gun Club, believing that competition is the life of sport, offers $330 in cash and trophies for the amateur championship of Philadelphia and a radius of 50 miles. As the chances of becoming the champion must be confined to a small number, and as the shooters of ordinary and mediocre ability enjoy a contest with men of their own caliber as much as do the men of greater skill, the Classes B and C are offered the same inducements as for the "A" championship.

There will be three shoots: The first, an all-day shoot on Feb. 22, the second on March 25, and the third on April 1.

The shoot of Feb. 22 will be at 200 targets, divided in ten 20-bird events, the last 120 only counting for the championship.

The shoot of March 25 will be at 150 targets, or ten 15-bird events, the last 120 only counting for the championship.

The shoot of April 1 will be at 150 targets, as follows: Two 25-bird events, two 20-bird events and four 15-bird events, the first 120 only counting for the championships.

The championships will be decided on the grand total of 360 targets. The shooter breaking the greatest number will receive a championship trophy and $25 in cash. Shooters in Class B will receive $25 in cash and trophy. Shooter in Class C will receive $25 in cash and trophy.

In connection with each program there will be an optional sweep on each 20-bird event of 50c., divided Rose system, 5, 3, 1; 25-bird events, 50c., Rose system, 8, 5, 3, 1; 15-bird events, 25 cents; high guns, 50, 30, 20 per cent.

Corrections and Changes.

Pittsburg, Pa., Feb. 3.—Kindly note correction in 1910 yearly average of Mr. T. M. Ehler, Little Rock, Mo. Mr. Ehler shot at 2080 targets and broke 1893, an average of .9100 per cent., instead of shooting at 2160 targets and breaking 1893, an average of .8763 per cent., as published in our official list.

Feb. 4.—Please announce to the readers of Forest and Stream that the dates of the Eastern Handicap tournament, at Wilmington, Del., have been changed from July 18, 19 and 20, to July 11, 12 and 13. Kindly make change accordingly in your list of "Fixtures."

Elmer E. Shaner, Sec'y-Mgr.

Pittsburg, Pa., Feb. 4.—I note in the report of the Columbus, O., tournament in Forest and Stream, issue of Feb. 4, the statement is made that the Squier money-back system failed to make good by $125. This was probably a typographical error, as the amount in question was $1.25, not $125. I attended this particular tournament, and would state that it was not conducted under the true Squier money-back system, as set forth in the literature sent out by the Interstate Association, otherwise there would have been a surplus to divide among the high gun amateurs after all losses were paid back, instead of a shortage of $1.25, and this with no added money contributed to the Squier money-baek system.

L. J. Squier.

The Palefaces.

BOSTON, Mass., Feb. 1.—The first shoot for the month of February on the Palefacc grounds was held to-day, with the thermomcter down nearly to zcro, which made anything but plcasant conditions exccpt for the cold weather advocatc.

While some of the regulars still stay away, it was seen that a few braved the elements to havc one more try beforc the season got too far advanced. What success resultcd depends upon how you look at it, but it is safe to say that the scores hardly indicate what obstacles were encountered by those few who see-sawed for the entire afternoon in search of high average honors.

Clarke Osborne and Kirkwood early made the top class, and the lead was in doubt till the last shot was fired, with the latter holding the pole at the finish, with Clarke 2 hehind and a like number to the good of Osborne, whose last event did the most of harm.

In the added target race Clarke was the real leader, as the club rules allow only one prize to a shooter, with Charlie Marden, Osborne and Morse 2 targets to the rear. Scores:

		Broke.	Hdcp.	Total.
Kirkwood	12 12 19 13 14 17—87		4	91
Clarke	13 12 16 12 14 18—85		4	89
Osborne	11 14 17 13 13 15—83		4	87
Marden	12 10 15 15 12 15—79		8	87
Morse	10 11 18 10 12 14—75		12	87
Frank	12 12 16 13 11 18—82		4	86
Charles	10 10 13 13 11 13—70		12	82
Sibley	9 14 15 12 13 13—76		4	80
Jones	11 9 12 8 8 7—55		16	71

Jan. 25.—The last shoot for the month took place to-day, with one of the smallest crowds of the season; but what there were gave a good account of themselves, even with the weather conditions much against them.

Frank seemed to be the one to keep things moving in the right direction, his 87 being no mean score, while his right-hand man, Dickey, annexed second position with a target to the good of Osborne.

In the team match Frank and Dickey made a run-away race of it, getting within hailing distance of a possible, or some 24 targets better than any of the others. Scores:

Frank	14 13 17 12 13 18	87
Dickey	11 13 16 13 14 18	85
Osborne	12 12 18 15 10 17	84
Burnes	13 13 13 10 15 15	79
R Berry	8 11 16 14 14 16	79
Howe	9 11 15 7 11 16	69
Morse	7 12 9 9 10 15	62

Philadelphia Trapshooters' League.

PHILADELPHIA, Feb. 4.—The Highland Gun Club leads in the League tournament. To-day, on the South Camden grounds, its team defeated the South End team and took first place with 9 points and 1344 targets broken, against 7 points each for the South Ends and Whites. Haddonfield has 6 points and Meadow Springs 4.

Championship shoot, ten men to a team, 50 targets per man:

Northern Kentucky Gun Club.

THERE was a very good attendance at the weekly shoot of the club on Feb. 5, better than for several weeks. The day was fine in the morning, but cloudy and dark in the afternoon, with a strong cross-wind, which caused the targets to perform various puzzling stunts in their flight and kept some of the scores below the average.

In the first 100 targets there was some nice work done, that of Voige being especially worthy of mention. He broke 92 per cent., a score not to be ashamed of under the most favorable conditions, but particularly good on such a day as this. Irwin also did nice work, breaking 88 and getting in second place. These two shooters are comparatively new at trapshooting, having been interested in the sport for only a trifle over a year, and not having been very regular in their practice during that time. Both men are going to attend the G. A. H., and it is a safe prediction that they will land among the top-notchers, if neither of them should succeed in annexing the big prize. The fact that the G. A. H. is to be held at Columbus this year is having the effect of reviving the interest in trapshooting in this section, and with the arrival of settled weather, we look for an increased attendance at all the club shoots. Holaday, Jr., could not do himself credit to-day, as he used several different guns. At that, he got third place on a score of 86, which was not bad, when the hard conditions are taken into consideration. Schreck was affected by the weather, and did not do as well as he knows how. Beall used to be one of the regulars, but has not been over before for a long time, and his score shows that he has had little practice. Luverne has not done enough target shooting in the past year to keep up his average, but when it comes to live birds, that's a different story. Holaday, Sr., is one of the "old guard," but he can still show the way to some of the newer shooters, and in the team match he and his partner, Schreck, got the best of Adams and Luverne by 3 targets, on a score of 78 to 75. There will be a little live-bird shooting on Thursday, Feb. 9, in preparation for the shoot to be held on the grounds of the Cincinnati Gun Club, Feb. 16. Many of the local shooters are getting ready for the Ohio State wingshot championship event, to be held at Ryland on Feb. 22, on the grounds of the Crystal Lake Gun Club.

Rifle Range and Gallery.

Fixtures.

March 11-18.—Fifteenth annual championship under auspices of Zettler Rifle Club, 159 W. 23d St., New York.
June 3-4.—St. Louis, Mo.—Second annual combination tournament, Missouri State Rifle Association. C. C. Crossman, Sec'y.

Cincinnati Police Revolver Club.

THE third match in the series for the Roll-Crawford-Brandemour trophy was shot on Feb. 3 at the City Hall range, eight members of the club taking part. Some good strings were made in the slow fire rounds, but the men fell down when it came to the rapid fire, as none of them have had any practice to speak of in this kind of shooting. It was taken up last summer when the team was practicing for the meet at Camp Perry, and has never formed a part of their indoor range work until this winter. R. Buck was high man with 27, defeating Sergt. Williams by one point. P. L. Curlis was high man for the match with a total of 179. This is his second win in the series, and one more will give him the trophy. In the slow fire rounds he was high with 159 out of a possible 200. Major Carroll was second with 153, and Sterley third with 149. In the totals Sergt. Williams and R. Ruck tied for second place, the former being one point ahead on the slow fire, which the latter made up in the rapid fire round. The club team will meet the Cincinnati Revolver Club in the Revolver League series on Feb. 10, the match being shot on the City Hall range.

Trophy match, 20 shots, slow fire and 5 shots rapid fire (20 seconds), 20yds., Standard American targets; possible total 250; revolver, .38cal., full service ammunition:

P L Curlis	7 7 8 10 9—41

97.28%

1910 High Amateur Average

Won by MR. J. S. DAY, of Midland, Texas, using

97.28%

Peters Factory Loaded Shells

Mr. Day shot at **4280** targets in Registered Tournaments, breaking **4164.** an average of **97 28%**, exceeding by over **2%** the highest official amateur average of any previous year. During the season Mr. Day made many long runs, among which are the following:

Gorman, Texas, and Walnut Springs, Texas, August 15-17—**245** Straight
Walnut Springs, Texas, - - - - - " 17-18—**266** "
Midland, Texas, - - - - - - - " 8-9 **133** "
121 "
Big Springs, Texas, - - - - - " 10-11 **175** "
152 "
Cisco, Texas, and Gorman, Texas, - - " 12-15—**190** "

PARTICULAR ATTENTION

is directed to the fact that all of Mr. Day's shooting was done with PETERS REGULAR FACTORY LOADS, purchased from dealers where the various tournaments were held. His shells were not special in any sense, but were regular stock goods such as can be procured from any PETERS dealer. YOU can get this SUPERIOR AMMUNITION as easily as ordinary loads. You may not always score 97.28% but you will average better than with any other make.

Shoot the shells that have established another World's Record—97.28%—the kind that do not have to be used in any special make of gun to give best results.

San Francisco: 608-612 Howard Street. J. S. FRENCH, Manager

Columbia University Rifle Club.

New York, Feb. 4.—The following scores were shot last Tuesday night in our match for the week ending Feb. 4, against Louisiana State University, Baton Rouge, La. Everyone was in poor form, owing to the mid-year examinations, which reign supreme in the collegiate world at this time. All shooting was at 50ft., on the N. R. A. target, the 10-ring being ½in. in diameter. Artificial light and military rifles are used; the caliber being .22.

The scores follow:

	Standing.	Prone.	Total.
Ehrlich	96	100	196
Lane	96	99	195
Baker, captain	95	98	193
Krefeld	94	99	193
Leach	91	97	188
Hanke	92	95	187
Guiteras	87	97	184

FISH ON DECK.

The American liner Philadelphia, which arrived at New York the other day, reports that it shipped "seven boiling crests during a storm, and every crest was full of fish." The promenade deck was like an aquarium.—New York Fishing Gazette.

REFORESTING.

Continued from page 219.

If any one desires to establish a nursery to propagate his own trees we will be glad to advise him.* The growing of evergreens, especially the first year, requires experience and is not to be generally recommended if seedlings can be purchased at a reasonable price.

Planting is best done in the spring, as early as possible, so that the trees may secure the benefit of the spring rains and become well rooted before the season's growth takes place. We will ship trees in the spring as early as possible, and they ought to be planted at once.

When the trees arrive they should be taken to the planting field immediately and unpacked. The roots should be dipped in water and the plants "heeled in"; i. e., placed upright in a ditch and the dirt packed tight around the roots. They can be kept in this manner while the planting is in progress.

In making a hole it is well to cut off and remove a thin slice of sod, as this gives the plant a better opportunity to grow. The hole should be large enough to give room for the roots without crowding, but on a light soil the least dirt that is moved in order to set the plants properly the better it will be. The plant should usually be placed in the ground at the same depth that it was before, but on light, sandy soil it may be set slightly deeper. The earth should be packed about the roots thoroughly, so that the plant will be able to get all the moisture possible from the surrounding earth. Care should be taken also to place the roots in their natural position.

Special pains should be taken to prevent any exposure of the roots to the sun. Once they become dry the plants are very likely to die. The trees "heeled in" should be kept moist at roots.

The men continue planting back and forth across the field until the work is completed. The trees should be set at regular distances apart and the rows also at even distances in order to properly utilize the soil and light and to secure in time the greatest product. The spacing varies under different conditions, but for general forest planting six feet apart both ways is most desirable. When the trees are planted six feet apart in the row, and the rows are made six feet distant, it will require 1,200 trees to plant an acre.

In planting spruce special care must be taken to get the tree in the ground the same depth as it has been growing. The roots should also be placed in as near a normal position as possible.

Scotch pine is not recommended for planting on Long Island.

Cultivation is not necessary before planting, but it will improve the growth of plantation.

It is absolutely necessary that a much larger number of trees be planted on an acre than would be found in a mature forest. A close, dense stand of trees is necessary while they are young in order to produce a proper development in the

*Detailed information in regard to this work will be found in Bulletin 76, U. S. Forest Service, which can be secured of Superintendent of Public Documents, Washington, D. C., for ten cents.

future growth. The close planting produces a crowded and shaded condition which kills off the side branches when the trees are small, reduces the number and size of the knots and finally makes a higher grade of lumber.

The amount of moisture required by trees depends upon their root system. Such trees as the Scotch, Austrian and red pines, also black locust and red oak, make satisfactory growths upon dry soils because their long tap roots are able to take up moisture from the lower sub soil. No trees require or can make a satisfactory growth in cold soils thoroughly saturated with water, as air in the soil is necessary.

Whenever pasture or other lands of but little shade are to be planted with pine, the two-year-old seedlings are sufficiently large. In planting spruce only transplants should be used. When planting under heavy shade only transplants should be used, and if the shade is dense, the species which endure shade are most desirable to use.

In the destruction of forests by axe and fire, which has been taking place in this country ever since settlement began, vast areas not adapted to agricultural purposes have been cleared, placed in farms, tilled for a time, the soil exhausted and then abandoned. These areas are of varying size, but in the aggregate are extensive. In some places they include a few acres of an occupied farm; at others they embrace entire abandoned farms. This land is lying idle, is not producing any revenue for its owner; in fact, is held at a loss because taxes must be paid, and the interest on the capital invested is lost. A large area of such idle land in any State is just as serious an economic proposition as idle labor, because both are non-productive.

Such land should be planted with small trees in order to grow forest crops and reap a future profit. The resulting forests will also make the country more beautiful, more habitable, more healthful and more enjoyable. These forests will protect the hillsides from erosion, prevent the floods which carry down débris and devastate the lowlands, and will make the water in the streams more equable in its flow. These streams rendered cooler by the shade will support more fish, and the forest cover will also afford a shelter for birds and game. We can secure all of these benefits and at the same time realize a large profit from these idle lands if they are placed under wood crops.

Naturally every investment is attended with some risk, but in case of forest properties the owner must care for his own property, and to a very large extent his own policy determines its safety. In reforesting there are but four risks to be considered. They are injury from domestic animals, forest fire, insect pests and plant disease.

There is but little use in attempting reforesting unless the plantation is to be protected. In any case all domestic animals must be excluded after planting. They not only stamp down and injure the small trees, but often eat them off, producing stunted or deformed trees.

Fire is the worst enemy of young trees. A plantation, or in fact any forest growth, should always be protected from this danger.

Reforesting has been going on in this State several years, but it is difficult to determine all that has been accomplished.

Several large landowners have their own nur-

CHARLES DALY

SINGLE BARREL TRAP GUN

THIS gun, as are all Dalys, is the result of careful thought, practical knowledge and perfect workmanship.

QUALITY STANDS OUT BOLDLY ON THIS GUN

Embodies all the features of an Ideal Trap Gun. The first essential is a flat sighting surface, perfectly aligned. The **Ventilated Rib** gives this and more—it eliminates heat radiation. Other features are the specially designed fore-end, extra heavy breech, and all the fine points found in all Dalys.

American Duck Shooting

By GEORGE BIRD GRINNELL

NO single gunner, however wide his experience, has himself covered the whole broad field of duck shooting, and none knows so much about the sport that there is nothing left for him to learn. Each one may acquire a vast amount of novel information by reading this complete and most interesting book. It describes, with a portrait, every species of duck, goose and swan known to North America; tells of the various methods of capturing each, the guns, ammunition, loads, decoys and boats used in the sport, and gives the best account ever published of the retrieving Chesapeake Bay Dog.

About 600 pages, 58 portraits of fowl, 8 full-page plates, and many vignette head and tail pieces by Wilmot Townsend.

Price, *edition de luxe* on hand made paper, bound in buckram, plates on India tint paper, each copy numbered and signed by author, $5.00. Price, library edition, $3.50.

127 Franklin Street, New York

WOODCRAFT

By "Nessmuk." Cloth, 160 pages. Illustrated. Price, $1.00.

A book written for the instruction and guidance of those who go for pleasure to the woods. Its author, having had a great deal of experience in camp life, has succeeded admirably in putting the wisdom so acquired into plain and intelligible English.

FOREST AND STREAM PUBLISHING CO., NEW YORK

YOU know mallards—wisest and wariest of all ducks—Solomons of the air. You can't knock down mallards with a paddle nor can you get them with a gun that plasters its shots all over the face of creation.

A mallard shot is generally a long shot, and long shots require a hard-shooting, close-shooting gun.

That's why the long-headed man who goes to a mallard country takes a Lefever. When he swings it on a towering pair of mallards he does not question the result. He know it—

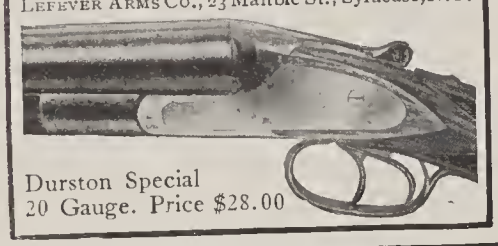
TWO CLEAN KILLS

The reason a Lefever kills clean and sure and far is **Lefever Taper Boring.**

But if you buy a Lefever for the taper boring alone, you will get more than your money's worth. For instance, you will never be handicapped with looseness at the hinge joint. The exclusive Lefever screw compensates for a year's wear by a trifling turn that you make yourself with a screwdriver.

LEFEVER
SHOT GUNS

Sixteen other exclusive Lefever features and Lefever simplicity and strength make the $28 gun the peer of any $50 gun on the market. Upwards to $1,000. Send for free catalog and get Lefever wise. Lefever Arms Co., 23 Maltbie St., Syracuse, N.Y.



Durston Special
20 Gauge. Price $28.00

Cor. Nassau St.,
New York.

With Silver Plated Locomotive Reflectors and Adjustable Attachments.

UNIVERSAL LAMP,
For Sportsmen's use. Combines Head Jack (Front and Top), Boat Jack, Fishing, Camp, Belt and Dash Lamp, Hand Lantern, etc.

EXCELSIOR LAMP,
For Night Driving, Hunting, Fishing, etc. Is adjustable to any kind of dash or vehicle. Send stamp for Illustrated Catalogue and address all orders Lamp Department.

WILDFOWL SHOOTING.

Containing Scientific and Practical Descriptions of Wildfowl; Their Resorts, Habits, Flights and the Most Successful Method of Hunting Them. Treating of the selection of guns for wildfowl shooting, how to load, aim and to use them; decoys and the proper manner of using them; blinds, how and where to construct them; boats, how to use and build them scientifically; retrievers, their characteristics, how to select and train them. By William Bruce Leffingwell. Illustrated, 373 pages. Price, in cloth, $1.50; half morocco, $2.50.

FOREST AND STREAM PUBLISHING CO.

When writing say you saw the ad. in "Forest and Stream."

series and are reforesting on a large scale. In 1909 this department tried to secure information on this subject, but was unable to secure complete data. It is, however, certain that private landowners have planted about 6,000 acres in the last ten years on their lands, and this commission has planted nearly as much more State land. The difficulty with private planting in the past has been to secure the necessary stock which we hope will soon be overcome by either State or commercial nurseries being able to fill the demand with good material at a reasonable price.

The demand for trees last spring (1910) was far greater than our supply. The result of this year's planting has not yet been compiled, but the summary for 1909 shows that about 1,091,000 trees were planted.

This shows that through our efforts 1,000 acres of private land were reforested during the past year. The trees were set at various spacings from as wide as ten feet by ten feet to as close as six feet by six feet, and some of the trees were used for underplanting, while a quantity of seedlings was set in nursery rows for planting in 1910 which, when planted, will increase the above acreage. The success of the work is indicated by the very high percentage (average 90 per cent.) living at the end of the first season, coupled with the most favorable opinions in regard to this work.

The most variable figures are given for the cost of planting. The prices range from $3 per acre for underplanting, when 400 transplants are set, to $15 to $16 per acre for setting transplants, at the rate of 1,200 per acre, but in the latter case excessive cartage, inexperience, high wages and board of men increased the cost. The general average, including cost of trees, when transplants are set six feet by six feet (1,200 per acre) ranges from $8 to $10 per acre. In several cases small plantings have been done at $6 to $7 per acre.

An examination of the applications shows that several parties are planting to protect their water supply, among these being both municipal water works and commercial companies. Our largest pulp and paper companies are planting in order to secure future supply of pulp wood. Many lumber companies are reforesting in order to grow lumber. The number of farmers and small landowners who are reforesting unused portions of their farms are the most numerous, but they usually buy in small quantity.

There are in this State thousands of acres of abandoned land which was never intended for agricultural purposes and will produce a good investment if properly planted.

This commission will be glad to assist private owners in this work as far as its time and ability will permit. It is the expectation that landowners with the assistance of the information in this publication will be able to proceed intelligently and successfully in the work.

GANDER IN PLACE OF DOG.

Ganders may take the place of dogs as pets and protectors in Wold county if others can be found as wise and helpful as the gander owned by Harry Wells of Gill. It takes its place on the wagon seat with its owner whenever he goes to town and remains there until home again.

At home it keeps guard over everything and keeps chickens out of the garden. I follows Wells over the fields when he works and is so jealous over him that it will not allow a dog to get near.—Denver Republican.

TRAPPING WEASELS.

It takes some money and very much patient application for a man with a dozen traps to go into the Maine woods in winter and capture enough weasel skins to line a cloak for his wife, says the Sun. Weasels are never abundant in any place. A person may live in the midst of a weasel country all winter and never see a specimen, though by putting out a dozen traps baited with raw beef dabbled in blood or with fresh fish scorched over a fire he can often catch from three to ten every night for weeks.

The apparent scarcity is curious. The weasel has no serious enemy in the animal kingdom, and being capable of fighting ferociously and slaying a rat four times its own weight, there is no reason why it should not multiply very rapidly, as it produces four litters of young every season, averaging from five to seven to a litter.

Most old hunters and woodsmen are aware that the fur of the weasel is the finest and glossiest borne by any animal in the world, but weasels have never been trapped much on account of their apparent scarcity, and not until the present century was well under way did the fur dealers think them worth quoting in the lists of raw furs.

Six years ago the large dealers listed weasel pelts at 10 cents each, provided they were whole and captured in mid-winter, when the fur is pure white with a black tip at the end of the tail. This winter the same kind of skins sell for from 20 to 25 cents each, and the dealers cannot find half enough to fill the demand. Usually they want to buy them in lots of 500 or more, all pure white and of uniform texture. Last winter a dealer in Caribou offered as high as 50 cents apiece for the last sixty pelts needed to complete an order for 500 skins which he had been three years in filling.

"If anybody thinks it is like playing to go out and collect 500 weasel pelts," said Billy Allen, an old trapper of Fort Fairfield, "he ought to try it once and find out. I took it up partly for fun but chiefly to reduce my waist line last winter, and followed it up for three months, and while my weight was reduced from 200 to 160 pounds and my health improved every day, the result of my work and worry was less than 100 skins that were salable.

"Think of what I undertook to do. The average skin from the average weasel is 4 inches long by 2 inches wide, so that a square foot of weasel pelts when sewed together holds the desirable parts of from eighteen to twenty weasels. This square foot is of no use to anybody unless twenty-four other square feet of weasel are found to complete the lining of the cloak, and twenty-five square feet of pelts, representing twenty weasels to the square foot, means weeks and months of hard labor in the catching and other weeks and months in the skinning and tanning and still other weeks and months in the matching and sewing together so as to make a uniform fabric.

"I do not know where the prepared skins are sold finally. Trappers of the Hudson's Bay Company around Montreal and Quebec tell me they are sold to private customers in St. Petersburg and Leipsic, which are the chief market places for rare and costly furs in the world.

"There is a story that the early Jesuit fathers, who visited Canada more than 200 years ago, brought from France a secret process for tanning and cutting small pelts and that the secret was conveyed to a few intelligent Indians, who passed the formulas down in their families from generation to generation. Anyhow I believe it is a fact that the threee most valuable furs in the world, the black fox, the fur seal and the sea otter, are all tanned by Canadian Indians before they are sent to London to be sold at auction."

GOOD HUNTING IN NAIROBI.

HUGH H. HEATLEY, of Nairobi, British East Africa, who has been in the United States since October diffusing information about the international big game club which he is organizing and which will take over some 50,000 acres of game preserve belonging to himself and W. N. McMilan, the American sportsman, who has been shooting in that part of the world for six years, left recently for England on his way home. Mr. Heatley said before sailing that he had been delighted with the reception given him by sportsmen over here. He felt that the club would have many American members.

Paul Rainey and Stewart Edward White will join the club. The former will start for Nairobi soon for a shoot.

"The number of Americans who have shot in the country in the past twelve months is considerable," said Mr. Heatley. "I can recall offhand, besides Col. Roosevelt, Dr. Ramon Guiteras, Major Louis L. Seaman, Col. Max Fleischman, Percy Madeira, Herbert Litchfield, Bayard Dominick and Henry Sampson, and there are others. Several noted English sportsmen will be members of the club, among them Lord Lonsdale, Sir John Harrington and F. C. Selous.

"One of these days the country will be shot out, and our aim is, using Mr. McMillan's Ju Ja farm and my own Kamit ranch as a nucleus, to obtain preserves aggregating from 500,000 to 1,000,000 acres in the best parts of the colony. The club membership will be limited to 300. The organization will make its own rules.

"The man who goes into that country for the first time to shoot is up against the fact that everbody is trying to find him out. He wastes a lot of money in his preparations. If he is making a circuit of the country he is likely to take out five or six hundred safari, which is unnecessarily large. His expedition is likely to cost him $3,500 to $5,000. We anticipate that a member of the club who wishes to shoot in the country will be able to do it on half the money a complete stranger would spend. All a man who belongs to the club will have to do will be to pack his bag and come along. He can get as good an outfit in Nairobi as in New York or London, and he will not buy a lot of unnecessary things."

"What wild animal, in your opinion, furnishes the best sport?" Mr. Heatley was asked.

"Personally I regard elephant hunting as the greatest sport there is. But if you meet any big animal of bad character you can get a rough time. Long experience with wild animals has convinced me that there are differences in the temperaments of beasts just as there are in those of human beings. Whether an animal shows fight depends on its character, whether it be a lion, a buffalo, an elephant or a rhino. There are many men that won't show fight when attacked, and hunters have killed lions who had no fight in them even after being wounded. On the other hand you might meet one whose breakfast had disagreed with him and he would be full of fight."

"Have you ever tamed any wild animals?"

"Well, I brought to England two wild hunting dogs which I had galloped down, but I should not like to say they have been tamed. They destroy other animals. I have seen wild dogs kill 100 head of wild animals on my place in twelve months. Before I came away I trapped a very rare specimen for that part of the world, a black leopard, which is the first ever caught there. Since I left my farm my man has trapped a leopard that measured 9 feet 3 inches in length, and another which is believed to be the biggest ever taken. They were after our pigs and got caught in a cage.

"A recent letter from my manager tells me that a lion and a lioness have taken up their abode in one corner of a 200-acre corn field, and that the opposite corner has been appropriated by an old bull buffalo. On the streams are wild duck, goose and snipe in any amount, but I am taking over some mallard as well as some wild rice which I think will grow there. I shall also try American quail.

"The main clubhouse is Mr. McMillan's town

Marlin Big Game REPEATING RIFLES Model 1893

The Special Smokeless Steel barrel, rifled deep on the Ballard system, creates perfect combustion, develops highest velocity and hurls the bullet with utmost accuracy and mightiest killing impact.

The mechanism is direct-acting, strong, simple and perfectly adjusted. It never clogs. The protecting wall of solid steel between your head and cartridge keeps rain, sleet, snow and all foreign matter from getting into the action. The side ejection throws shells away from line of sight and allows instant repeat shots, always.

Built in perfect proportion throughout, in many high power calibers, it is a quick handling, powerful, accurate gun for all big game.

Every hunter should know all the *Marlin* characteristics. Send for our *free* catalog. Enclose 3 stamps for postage.

THE NARRATIVE OF A SPORTSMAN

INTER-OCEAN HUNTING TALES

EDGAR F. RANDOLPH

A series of hunting reminiscences of rare charm for the sportsman and for the wider circle which delights in true tales of outdoor life. With none of the high coloring and exaggeration which give a false note to so many hunting stories, Mr. Randolph's book is never lacking in interest.

He covers the field of sport with the rifle, east and west, drawing a vivid word picture of life in the open, subordinating his own exploits to the main incidents of outdoor experience, giving much valuable information on camp life, hunting and the habits of wild game, and continually delighting the reader with the freshness of his viewpoint.

This book will strike a sympathetic chord in the memory of every big-game hunter of experience and will prove of real value to the novice who is planning an excursion into the wild.

AMERICAN BIG GAME IN ITS HAUNTS

Boone and Crockett Club Series

Edited by GEORGE BIRD GRINNELL

An invaluable work not alone for the sportsman, but for the student and lover of wild life. Treats of big game preservation and protection in the broader sense; tells of the habits, habitat and life history of the larger wild animals; touches upon the problem of the public forest domain, and is rounded out by interesting hunting reminiscences by such leaders in the fraternity of big-game hunters as Madison Grant, Paul J. Dashiell, George Bird Grinnell, Jas. H. Kidder and W. Lord Smith. Bound in cloth, library edition, heavy paper, richly illustrated, 497 pages.

Postpaid, $2.50

FOREST AND STREAM PUBLISHING CO., 127 Franklin Street, NEW YORK CITY

house in Nairobi, where there is good society and plenty of diversion. The home estate is twelve miles away. We shall not tie up huge acreage for pleasure alone, but we shall carry on ostrich farming on an extensive scale. The big birds are to be found by the thousands in a wild state. The feathers compare favorably with those of South Africa, which has been farming for two generations."—The Sun.

BEAVERS IN COLORADO.

Enos Mills, of Estes Park, Colorado's self-taught naturalist, is an ardent champion of the beaver, and has written convincingly in proof of that animal's benefit to the country as a conservationist. From many years' study of the beaver and his works Mr. Mills is convinced that a vast amount of good has been done by this industrious animal, whose dams have retarded the floods that otherwise would have swept down the mountain sides and denuded the slopes of soil and trees.

The survival of the beaver is one of the interesting stories of the West. It was the beaver that lured the first trappers to the far West, and that resulted in the first real exploitation and trail blazing in the land that was known vaguely as the "great American desert." The beaver was hunted by roving bands of company men and free trappers for many years.

Many great fortunes were built on a foundation of beaver pelts. The romance of the West centers about the beaver. Only for the ceaseless search for that valuable animal the world would have known little of Carson, Bridger, Fitzpatrick, the Sublettes, Ashley and other heroes of the wilderness whose names will figure long in Western history.

In spite of the price that was put upon his head, the crafty beaver has managed to survive in encouraging numbers. In Colorado, where there is no open season, beaver colonies are increasing. Occasionally the beaver makes himself a local nuisance by flooding some ranchman's hay meadows, but in general he is conducting himself as an upbuilder and not a destroyer.—Denver Republican.

FINDING A ROCKY BOTTOM.

On the coast of Peru there is a race of Indians, most expert fishermen, who go to a considerable distance from the land on little fishing vessels composed simply of bundles of grass or bent tied together in cigar shape and about 10 feet long. The men sit astride on the bundles, paddle in hand and with their fishing-gear and provisions disposed about them. The fish are plentiful wherever there is a rocky bottom with abundance of seaweed, and the Indians have a most remarkable way of distinguishing such bottom, even at a depth of 50 fathoms, from the sandy ground. The wooden paddle is placed upright in the water (when a supposed likely place is come to) with the butt end uppermost, and the ear is applied to this, or if the water is very deep, the teeth are placed in contact with the stock. A vibrating or rippling sound is clearly noted over rock, while a sandy or muddy bottom emits no noise. When the noise is heard these simple people say "*llora la peña*" (the rock is crying), cast their stone anchor and begin to fish. Alexander Mann, the author of Yachting on the Pacific, who spent the greater part of a lifetime in Peru and Ecuador, and is himself, like most Scots, a keen fisherman, says that he often tested this by using a sounding-lead, and invariably found rock at from 10 to 40 fathoms where the Indians said "the rock cried."—British Sea Anglers' Society's Quarterly.

LITTLE TO DO.

How little the fish, says the Washington Post, have to do with the settling of fisheries disputes!

The Forest and Stream may be obtained from any newsdealer on order. Ask your dealer to supply you regularly.

ARCHERY AND THE RIFLE.

CERTAIN fundamental principles may be inherent in sports or games which are very little alike. Shooting with rifle, shotgun and the long-bow are often considered by those who know little about either as very similar sports, because in each case one is trying to hit some mark. But except in the matter of aiming they are not alike.

In a recent article in Collier's Weekly, Mr. Van Dyke had a very interesting and instructive article on "Shooting at Moving Game." Many of his statements on aiming or sighting are, says Edward B. Weston, in the Christian Science Monitor, are as true in archery as in the use of the rifle or gun.

Aiming when shooting with bow and arrow is very like aiming in rifle shooting, but little like the shotgun method. The quotations which follow are from Mr. Van Dyke's article; but what we have to say applies only to shooting at a stationary target, and not at game or moving objects.

"With a shotgun your eye holds on the bird, but with the rifle your eye must hold the sights."

Up to about 50 years ago the archer was taught to fix his eye intently on the "gold" of the target, or the "bird,' or whatever object he wished to hit, and shoot instinctively. There was no careful sighting recognized. Without doubt good shooting was done in this way in the days when the bow was the weapon of war and the chase, and its use compulsory. But it was the hit-or-miss shotgun method.

Horace A. Ford taught a better method. Others possibly had used it without appreciating what they were doing. But Ford first called attention to it, formulated its rules and gave it a name, "the point of aim" method. This was the rifle method of aiming applied to archery; by which we mean, holding your eye on the sight and not on the object to be hit.

The "point" of aim is the spot to be aimed at, in order to hit the bull's eye—called the gold in archery. In using the rifle the rear sight is raised or lowered for different distances, so that in aiming at a stationary object the sight always covers it. In using the bow, the front sight is raised or lowered; the rear end—the feathered end of the arrow—being drawn to the same place at each distance shot. At a certain distance from the target the "gold" and the point of aim are the same.

But if you wish to shoot at a shorter distance you must lower the front sight—the point of the arrow. Now the point of aim and the gold will not be the same—will not coincide. The point will be below the gold, on the target, or on some spot on the ground in front of the target. Let us suppose the point has been found and covered with a small piece of white paper, in order readily to be seen.

If you aim at this piece of paper, and shoot correctly, you will hit the gold. Don't let your eye hold on the gold, but on the point which is now covered by the sight—the point of the arrow, making them practically one. It is not necessary to see the gold or target, though it is usually done by indirect vision.

What Mr. Van Dyke says about guessing in aiming is as true in archery as in rifle shooting.

"Next you have to guess whether you are doing it right or not. * * * Then you have a blank space to hold on, instead of a well defined mark. Suppose you hit the four-inch bullseye at 100 yards every time. Now without shifting the sights, but by shifting the rifle, see how near you can come to making the same group of shots on a blank wall six feet to one side of the bullseye with no particular spot to aim at, and part of your attention still kept on the bullseye."

Let us suppose one is shooting 60 yards. With a bow of the power which most archers use, the point of aim will be on the ground, let us say 10 yards in front of the target. Now, if the point is sharply defined, all is well. But suppose we are shooting over a perfectly kept lawn, smooth and of uniform color. In an archery match it is not permissible to place an artificial point, though we believe it should

Nursing vs. Dosing.

A Treatise on the Care of Dogs in Health and Disease. By S. T. Hammond ("Shadow"), Author of "Training vs. Breaking." 161 pages. Cloth. Price, $1.00.

Mr. Hammond believes that more dogs are killed by injudicious doctoring than by disease, and the present work is a protest against the too free use of medicine when dogs are sick. The author has given especial attention to many of the troubles which especially afflict small dogs kept in the house, and likely to suffer from lack of exercise and from over-feeding; and boys and girls owning dogs—as well as children of larger growth—may profitably study and ponder this volume.

Contents: Importance of Nursing. Cleanliness. Out-of-Sorts Dam. Puppies. Diet. Other Foods. Kennel and Exercise. Common Ailments. Teething. Diarrhea. Convulsions. Epilepsy. Distemper. Eczema. Need of Proper Care. Sour Stomach. Vermin. Canker of the Ear. Mange. The Nervous System. Abscesses. Colic. Worms.

Gas Engines and Launches.

Their Principles, Types and Management. By Francis K. Grain.

The most practical book for the man or boy who owns or plans to own a small power boat. It is motor launch and engine information boiled down and simplified for busy people, and every line of it is valuable. Cloth, 122 pages. Postpaid, $1.25.

FOREST AND STREAM PUBLISHING CO.

The Indians of To-day.

By George Bird Grinnell. Demi-quarto, 185 pages, buckram. Price, $5.00.

It describes the old-time Indian and the Indian of to-day, and contrasts the primitive conditions and ways of living with those of the present. It contains over fifty full-page portraits of living Indians from photographs.

Contents: The North American Indians. Indian Character. Beliefs and Stories. The Young Dogs' Dance. The Buffalo Wife. A Blackfoot Sun and Moon Myth. Former Distribution of the Indians. The Reservation. Life on the Reservation. The Agent's Rule. Education. Some Difficulties. The Red Man and the White.

FOREST AND STREAM PUBLISHING CO.

The Story of the Indian.

By George Bird Grinnell, author of "Pawnee Hero Stories," "Blackfoot Lodge Tales," etc. 12mo. Cloth. Price, $1.50.

Contents: His Home. Recreations. A Marriage. Subsistence. His Hunting. The War Trail. Fortunes of War. Prairie Battlefields. Implements and Industries. Man and Nature. His Creation. The World of the Dead. Pawnee Religion. The Old Faith and the New. The Coming of the White Man. The North Americans—Yesterday and To-day.

FOREST AND STREAM PUBLISHING CO.

Sam Lovel's Boy.

By Rowland E. Robinson. Price, $1.25.

Sam Lovel's Boy is the fifth of the series of Danvis books. No one has pictured the New Englander with so much insight as has Mr. Robinson. Sam Lovel and Huldah are two of the characters of the earlier books in the series, and the boy is young Sam, their son, who grows up under the tuition of the coterie of friends that we know so well, becomes a man just at the time of the Civil War, and carries a musket in defense of what he believes to be the right.

FOREST AND STREAM PUBLISHING CO.

Rhymes of The Stream and Forest

FRANK MERTON BUCKLAND

One of the freshest, most delightful collections of outdoor verse offered for many a day. They are the outpourings of a spirit which loves nature, the woods and streams and growing things, and appreciates its charms.

Mr. Buckland's verse has a charm that is at once rare and delightful. This book will appeal to every outdoor man or woman, and particularly to the "Brethren of the Angle."

Its form is as attractive as its pages, closely simulating the appearance of the standard fly-book, printed on heavy laid paper with ornamental border designs of trout flies, pocket for clippings, and blank pages for copying or individual composition. It is just the thing for the den, for the pocket, or for a gift to the friend who loves the big world out of doors.

Postpaid, $1.25

FOREST AND STREAM PUBLISHING CO., 127 Franklin Street, NEW YORK CITY

PLANNING A HOUSEBOAT

Will be a leisure-hour occupation in many a family this winter. Houseboating has come among us to stay, and promises to be even more popular than in England itself. Every one who is interested in houseboats or who contemplates taking up this feature of outdoor life, should read Mr. Albert Bradlee Hunt's practical, and, at the same time, beautiful work on the houseboat and its adaptation to American waters.

HOUSEBOATS AND HOUSEBOATING

Covers the entire range of its title, considers the use and opportunities of the houseboat; their relation to city and suburban life; construction, furnishing, motive power, and all the thousand and one details, the knowledge of which spells the difference between success and failure in houseboat building and houseboat life.

Details, plans, drawings and specifications illuminate the text, while life on houseboats is interestingly described. Some of the more noted English and American houseboats and the life thereon are also described at length with illustrations. Buckram, heavy paper, sumptuously illustrated.

Postpaid, $3.34

FOREST AND STREAM PUBLISHING CO., 127 Franklin Street, NEW YORK CITY

be. Now we must hold at an estimated distance from the target.

If the rifleman shoots at a distance estimated at six feet from the bullseye, he will find that few shots will be in the four-inch space he was trying to hit. If an archer is compelled to estimate his distance from the gold instead of aiming at a point, he will find his score much poorer. The estimate is as bad for the archer as for the rifleman.

What Mr. Van Dyke says about pulling the trigger applies as well to loosing the string in bow shooting. Neither must be done with a jerk. A one-pound pull on the trigger is better than two.

So in archery; a better loose is obtained, and in shorter time, by shooting a heavy rather than light bow, provided always that the archer is not using a bow too heavy for him. In using a bow of too few pounds' pull, the string will not leave the fingers so quickly and smoothly as it will if the bow pulls more. In one case the string has to be helped off, so to speak; and in the other it pulls itself off when given the slightest opportunity; less time is consumed, and with less chance for the archer to give a lateral, or an up, or a down direction to the arrow.

A SPORTING PARADISE.

There is a fascination about an island somehow, and it always suggests the delights of Robinson Crusoe. I had a friend who once rented quite a small island off Cornwall, but it was a wonderful place to spend a holiday. It was only a little island, but I see quite a big one in the market, half a million acres of moor, loch and river, full of salmon, deer, grouse and snipe. A thousand salmon, averaging eight to ten pounds, are caught annually in the principal river, and a hundred and fifty stag are shot in the largest forest. It has a capital, Stornoway, quite an up-to-date town, with water, gas and drainage, to say nothing of smaller townships, hamlets and fishing villages. This island of Lewis, the principal of the Outer Hebrides, has some 28,000 inhabitants and a rent roll of £17,000 a year, to say nothing of an industry in Harris tweeds. The castle has forty bed rooms and a grand ball room, and was built by Sir James Matheson, uncle of Major Matheson, who wants to sell, who spent the best part of a million in buying the island building the castle, planting trees, making roads, and so on. Now, for a mere matter of £300,000, together with quite a nominal rent to the Crown, anyone can become owner of this little private kingdom. It is a regular sporting paradise, and alluring to those who can afford such a capital outlay.

Talking of islands, G. A. M. Buckley has just bought the small isle of Shuna, off Argyllshire, which used to belong to his maternal ancestors, the Macleans, who sold it in 1815 for £10,000. Mr. Buckley has bought it back for £4,000, nearly a century later.—The County Gentleman.

A district twenty miles beyond Chelicamp, in the far northwest of Cape Breton, has a terrific plague of mice. The whole country swarms with the destructive creatures. The mice have burrowed underground and excavated a network of subterranean roads.

They began their destructive work on the hay crop, cutting it as it stood in the fields. When that was stored they attacked the grain and the forty farmers there have saved only seven bushels. They attacked the potatoes, and the diggers on opening up the drills find little more than the stem of the larger potatoes left in the ground. The mice have carried their work of destruction to the woods and are stripping the bark from the saplings, and now they are entering houses, cutting their way through the walls and threatening to destroy clothes and household furniture.

No remedy is in sight. The people have been digging pits to entrap them, but in spite of myriads destroyed in this way there seems to be no abatement of the plague. The farmers are afraid to use poison for fear of polluting the streams and wells from which their cattle derive their supply of water.

GUNNER GUMPTION'S
LANTERN LECTURETTES ON

GREENER GUNS

The Greener Facile Princeps Action.—"Facile Princeps" is a Latin phrase meaning **'Easily First,'** and no better name could have been chosen for a gun that has been winning the principal shooting events of the World for three generations. The 'Facile Princeps' is easily first for strength, reliability and simplicity. The lockwork consists of a hammer, a scear, a lifter and a spring, the weight of the barrel cocks the tumbler, everything works smoothly with the minimum of friction, and the striker is just a fraction of a second quicker in its blow than any other type of mechanism; this point alone should be sufficient to secure its adoption by the man who knows.

Have you ever calculated how fast a bird travels? If instead of being able to pull the trigger (*i.e.* fire the cartridge) in 1-200th of a second, you need 3-100ths of a second, the bird will have flown 16 inches further. Think this over, it may account for some of those 'lost' birds.

The "Box" action of the "Facile Princeps" gun is perfectly watertight, yet easily get-at-able for cleaning purposes, only one screw has to be removed to expose the lock mechanism.

Look at the drawing, its simplicity cannot fail to convince you that the "Greener" is the best.

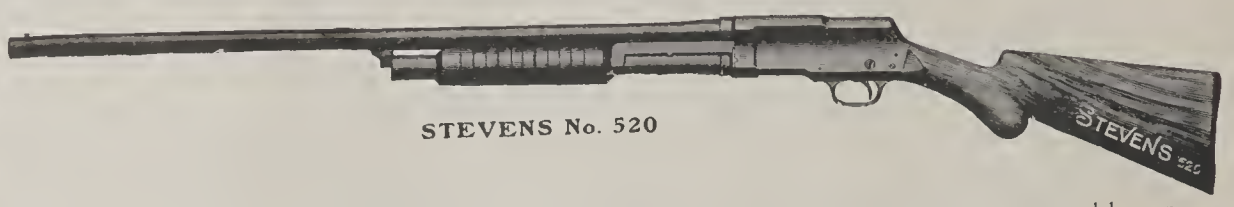
HERE'S ONE FROM A GUN DEALER

We asked him how he had made out with a No. 520, which he had bought from his jobber. This is the way he answers—it's worth reading:



STEVENS No. 520

"Referring to that part of your letter wherein you state that you trust we sold our customer the pump gun, will give you his own words: 'Wood, you persuaded me to take that gun out and try it against my better judgment. I did so because it happened that there was no other Hammerless at the time in the case. Now you can keep the Hammerless and I would not trade the pump back to you for $10.00 to boot. It suits me to a T, and the only way I could be convinced was to try it; all the talking would have done no good, as I never thought much of a pump gun.'"

Get your dealer to show you a Stevens No. 520 and see for yourself why this dealer's customer kept his.

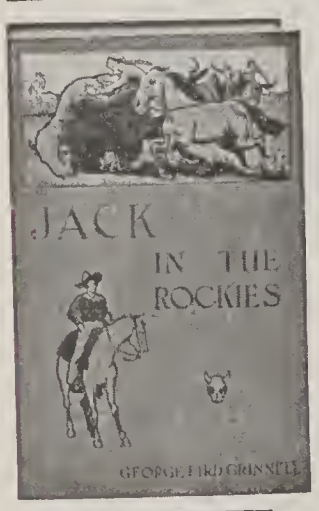
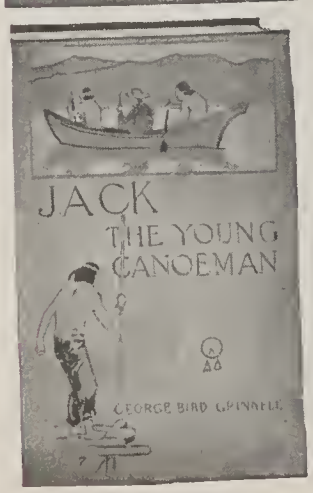
THE JACK SERIES





Best Books For Boys

By GEORGE BIRD GRINNELL

THE solution of the parents' problem of providing for the growing boy reading at once healthy and satisfying to his craving for action and adventure. In the Jack Books the longing of the normal boy for Western stories is gratified, the interest is absorbed and the mind is unconsciously led to phases of life that are elevating and instructive.

The books are the story of a young New York lad, sent to Stillwater ranch in the Rockies for his health, who becomes the companion of a veteran of the frontier. For each of six succeeding years he is led through new territory and experiences, accumulating much of the lore of plain and mountain, enriched with tales of the old West.

Ranch life, travel and hunting on the lonely plains, Indian camps, mountain climbing, trapping and canoeing are described. There is not a dull page, and the author manages to put much of the spirit of the West into his books. Jack is a real boy, and the books are stories for live boys—not lectures in disguise.

American Game Bird Shooting

By George Bird Grinnell

This new book covers the whole field of upland shooting in America as this field has never before been covered, and is intensely interesting and useful to everyone who uses the shotgun. It deals with the birds followed with dog and gun by the upland shooter, and describes the habits of the woodcock, snipe, all the North American quail, all the grouse and the wild turkeys.

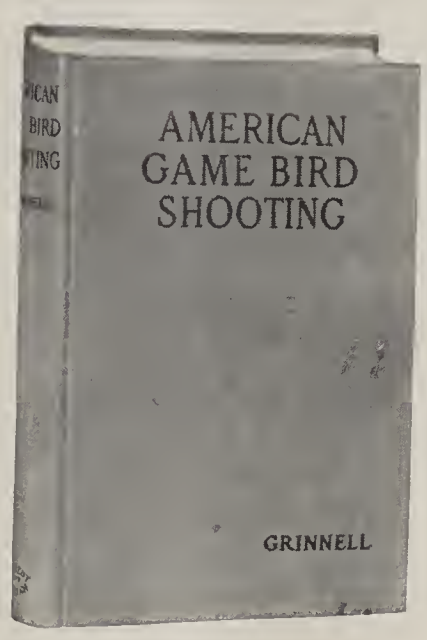
The completion of this book was a large task, requiring exceptional qualifications, knowledge and experience, and was never before accomplished by any other author.

It is the companion volume to Mr. Grinnell's book, "American Duck Shooting." Thus the two books cover the entire field of game birds taken with the shotgun, with complete description of their natural history features.

"A very complete monograph for sportsmen and naturalists....with anecdotes, of his own and others....the book will be enjoyed not only by sportsmen but by the general reader."
—The Sun, New York.

"An important, thoroughly reliable and well written book; a work that will be read with interest and pleasure by sportsmen. The work is the first complete one of its kind."
—The Boston Globe.

"No book as good as this on the subject treated, nor so fully covering the field, has been produced." **—The Salt Lake Tribune.**



"This volume is especially welcome—a treat to every man who loves to tramp the uplands with dog and gun." **—Inter-Ocean, Chicago.**

"Each bird is taken up in turn, the best methods to hunt, the selection of guns and loads, clothing and dogs are set forth simply and fully."
—Baltimore American.

"It is, I think, a model of what such a book should be—but so seldom is. It is, indeed, much more than a treatise on field sports, for it furnishes such full and excellent life histories of the birds of which it treats that it should find a place in every library devoted to pure ornithology."
—William Brewster, Cambridge, Mass.

PART I. Describes in detail the ways of life of all the American Game Birds; woodcock, snipe, bobwhite, mountain quail, California quail, Gambel's quail, scaled quail and Mearn's quail; dusky grouse, Franklin's grouse, Canada grouse, ruffed grouse, all the ptarmigan, pinnated grouse, sharp tail grouse and sage grouse, and the wild turkeys.

PART II. Is devoted to upland shooting. Here are described at length and in detail all the various methods of taking all the birds mentioned above, and the various aids to shooting, such as guns and loads, dogs and clothing.

PART III. Deals with the shooting of the past and future; tells of the efforts to introduce foreign and native game birds to restock our covers, and of the successful attempts by Dr. Clinton F. Hodge to rear in captivity the ruffed grouse and bobwhite.

The volume is handsomely illustrated. There are colored plates of the ruffed grouse and the quail, made by America's greatest bird painter, Louis Agassiz Fuertes, and 48 other full page plates, most of them photographs from life, showing portraits of different species of birds and interesting shooting scenes. In the text are a number of useful and interesting line cuts. Everyone who delights in the outdoor life and rejoices in tramping the field and woods with dog and gun should possess this handsome volume, which speaks the final word on upland shooting, as its predecessor in this field did on wildfowl shooting.

Cloth. About 575 pages. Price $3.50 net. Postage 25 cents.

FOREST AND STREAM PUBLISHING CO., 127 Franklin Street, NEW YORK CITY

THE OUTDOOR LIBRARY

¶ Seasonable Books dealing with every phase of the life in the Open. Handbooks of Sport. Books that make "roughing it" easy. Books for Fisherman, Hunter, Yachtsman, Canoeist, Camper, Nature Lover. Books of Travel and Adventure for Young and Old.

Book Catalogue Free on Application.

Uncle Lisha's Shop.

By Rowland E. Robinson. Life in a Corner of Yankeeland. The shop itself, the place of business of Uncle Lisha Peggs, bootmaker and repairer, was a sort of sportsman's exchange, where, as one of the fraternity expressed it, the hunters and fishermen of the widely scattered neighborhood used to meet of evening and dull outdoor days "to swap lies." Cloth. 187 pages. Price, $1.25.

Sam Lovel's Camps.

Rowland E. Robinson. Another charming story of life in innermost Yankeeland. Quaint and delightful stories of a delightful life. A splendid book for boys and scarcely less pleasing to their elders. Cloth. Illustrated. Postpaid, $1.00.

American Big-Game Hunting.

The Book of the Boone and Crockett Club. Theodore Roosevelt and George Bird Grinnell, editors. Narratives of white goat hunting, elk hunting, old times in the Black Hills, prong-buck coursing, nights with the grizzlies, buffalo days, blacktails in the Bad Lands, notes on forest reservations and game refuges. Contributors: Theodore Roosevelt, George Bird Grinnell, Owen Wister, Winthrop Chanler, Col. Geo. S. Anderson, Col. Roger D. Williams, Archibald Rogers, F. C. Crocker, Dean Sage, and others. Cloth. Illustrated. Postpaid, $2.50.

Trail and Camp-Fire.

The Book of the Boone and Crockett Club. Editors: George Bird Grinnell and Theodore Roosevelt. Illustrated. Like its predecessors, the present volume is devoted chiefly to the great game and outdoor life of Northern America; yet it does not confine itself to any one land, though it is first of all a book about America, its game and its people. Cloth, 353 pages. Price, $2.50.

American Big Game in Its Haunts.

The Book of the Boone and Crockett Club for 1904. George Bird Grinnell, Editor. This is a fourth and by far the largest and handsomest of the club's books. It opens with a sketch of Theodore Roosevelt, founder of the Boone and Crockett Club, and contains an extremely interesting article from his pen descriptive of his visit to the Yellowstone Park in 1903. Other papers are on North American Big Game; Hunting in Alaska; The Kadiak Bear; Moose, Mountain Sheep; Game Refuges, and other big game topics. 490 pages and 46 full-page illustrations. Price, $2.50.

American Duck Shooting.

George Bird Grinnell. With 58 portraits of North American Swans, Geese and Ducks, Plans of Boats and Batteries. Fifty Vignettes in the text and a chart of the topography of a duck's plumage. Cloth, 630 pages. Price, $3.50. Edition de luxe, price, $5.00.

The Art of Shooting.

Charles Lancaster. An illustrated treatise on the art of shooting. Illustrated. Cloth. Price, $1.25.

The Gun and Its Development.

W. W. Greener. With Notes on Shooting, Breech-loading Rifles, Sporting Rifles, Shotguns, Gunmaking, Choice of Guns, Choke-boring, Gun Trials, Theories and Experiments. "The Gun and Its Development" is the standard work of the age on projectiles and all relating to them. Fully illustrated. Cloth. 770 pages. New edition. Price, $4.00.

Domesticated Trout.

Livingstone Stone. Contents: Trout Breeding Works, Ponds, Buildings, Hatching Apparatus. The Nursery, Taking the Eggs, Hatching, Care of Alevins, Rearing the Fry, Growing the Large Trout, General Observations. Cloth. Illustrated. Postpaid, $2.50.

Modern Fishculture in Fresh and Salt Water.

Fred Mather, author of "Men I Have Fished With." with a chapter on Whitefish Culture by Hon. Herschel Whitaker, and a chaper on the Pike-Perch by James Nevin. Illustrated. Price, $2.00.

Familiar Fish and How to Catch Them.

Eugene McCarthy. A Practical Book on Fresh-Water Game Fish. With an introduction by Dr. David Starr Jordan, President of Leland Stanford Junior University, and numerous illustrations. Price, $1.50.

Training the Hunting Dog for the Field and Field Trials.

B. Waters. This is the latest and best manual on the subject. As an owner and handler of field trial dogs, and one having had an exceptionally wide experience in the field and at field trials, Mr. Waters was admirably equipped to write such a work. It has already taken its place as the standard authority. Cloth. 281 pages. Price, $1.50.

Log Cabins and Cottages.

William S. Wicks. This book covers building for the woods from the simplest shelter to the most elaborate cottage, cabin or house, and their furnishing and fitting. The details and directions are at once simple and comprehensive, and the illustrations are numerous and illuminative. Cloth. Illustrated. 44 full-page plates and numerous text illustrations. Postpaid, $1.50.

Pocket Kennel Record.

A handy book for immediate record of all events and transactions, relieving the owner from risk of forgetting important kennel matters by trusting to memory. Morocco. Postpaid, 50 cents.

Diseases of the Dog.

By Hugh Dalziel. A handbook for amateurs. Treats of the causes of disease in dogs, symptoms and treatment, modes of administering medicine, treatment in cases of poisoning, etc. Paper. Postpaid, 40 cents.

The Spaniel and Its Training.

F. H. Mercer. To which are added the American and English Spaniel Standards. Cloth. Illustrated. Price, $1.

Pheasants; Their Natural History and Practical Management.

W. B. Tegetmeier. New, enlarged edition. 16 plates. Cloth. 237 pages. Price, $3.50.

Woodcraft.

Nessmuk. No better book was ever written for the help and guidance of those who go into the woods for sport and recreation. It is simple and practical, and withal a classic, written with a rare and quaint charm. Cloth. 200 pages. Illustrated. Postpaid, $1.00.

Houseboats and Houseboating.

Albert Bradlee Hunt. The book contains forty specially prepared articles by owners and designers of well-known houseboats, and is beautifully illustrated with nearly 200 line and half-tone reproductions of plans and exteriors and interiors. A most interesting chapter is devoted to houseboating in England. Extra heavy paper, buckram. The price is $3.00 net. Postage, 34 cents.

How to Build a Motor Launch from Plans.

Charles G. Davis. A thoroughly practical guide for the amateur. Shorn of all blind technicalities, it considers displacement, good construction and faulty, stability, setting up the keel, framing and planking, with careful explanations. Each step is followed up to the care and running of the gas engine. Cloth, 9 folding drawings, 8 full-page plates, 40 smaller diagrams, 170 pages. Postpaid, $1.50.

Manual of the Canvas Canoe.

F. R. Webb ("Commodore"). Many illustrations of designs and plans of canvas canoes and their parts. Two large, full-sized working (24x38) drawings in a pocket in a cover. Cloth, 115 pages. Price, $1.25.

Canoe and Boat Building.

W. P. Stephens. Contains plan and comprehensive directions for the construction of canoes, row and sail boats and hunting craft, directions that the amateur with tools can follow. Fifty plates and working drawings in separate envelope. Cloth. Illustrated. 264 pages. Postpaid, $2.00.

Canvas Canoes and How to Build Them.

Parker B. Field. The book gives very precise instructions by which a man with ordinary mechanical bent may build a serviceable canoe at slight cost—a plan and all working directions. Paper. Postpaid, 50 cents.

Life and Sport in Labrador

NAPOLEON A. COMEAU.

In "Life and Sport on the North Shore of the Lower St. Lawrence and Gulf," Mr. Comeau has made a valuable addition to the literature of rod and rifle—and more. It is a book of engrossing personal interest to the sportsman or general reader, and of rare value to the student of wild life.

The author describes the events and experiences of fifty years, spent in the cause of humanity and science in one of the most interesting and least known sections of Canada. He writes as one sportsman to his fellows, detailing his experiences with the wild things of wood, shore and sea, with plenty of stirring experiences with big game and gamy fish.

Illustrated. 450 pages. Paper. Postpaid, $2.50.

HITTING vs. MISSING.

By S. T. Hammond ("Shadow"). Cloth. Price, $1.00.

Mr. Hammond enjoys among his field companions the repute of being an unusually good shot, and one who is particularly successful in that most difficult branch of upland shooting, the pursuit of the ruffed grouse, or partridge. This prompted the suggestion that he should write down for others an exposition of the methods by which his skill was acquired. The result is this original manual of "Hitting vs. Missing." We term it original, because, as the chapters will show, the author was self-taught; the expedients and devices adopted and the forms of practice followed were his own. This then may be termed the Hammond of system of shooting; and as it was successful in his own experience, being here set forth simply and intelligently, it will prove not less effective with others.

His Best Book

MY FRIEND THE PARTRIDGE

By S. T. HAMMOND

This delightful presentment of the glories of Autumn days with gun and dog in the crisp New England woods in search of the noblest of native game birds, which has already delighted thousands of readers of Forest and Stream, is now ready for delivery in book form.

Mr. Hammond knows his upland coverts as no other writer of the day. He makes no empty boast when he calls the partridge his friend, and, moreover, makes his every reader a friend of this splendid bird. He succeeds in a rare degree, not only in describing the ruffed grouse, its habits and habitat, and the pleasures of its pursuit, but in surrounding his reader with the very atmosphere of the leaf-scented Autumn woods. Mr. Hammond's book is a welcome addition to the library of sport.

Cloth. 150 Pages. Illustrated. Postpaid, $1.00

FOREST AND STREAM PUBLISHING CO., 127 Franklin Street, NEW YORK CITY

AMERICAN BIG-GAME HUNTING

BOONE AND CROCKETT CLUB SERIES

Edited by George Bird Grinnell and Theodore Roosevelt

A thoroughly stimulating book dealing with American big-game hunting, East, West and under the Arctic circle, including every phase of sport with the rifle. "American Big-Game Hunting" is a compilation of the experiences of some of the most widely known sportsmen in America. Among the sketches are: The Story of the Buffalo, Capt. Geo. S. Anderson; The White Goat and His Country, Owen Wister; Old Times in the Black Hills, Gen. Roger D. Williams; Coursing the Pronghorn, Theodore Roosevelt; After Wapiti in Wyoming, F. C. Crocker; In Buffalo Days, George Bird Grinnell; Blacktails in the Bad Lands, B. Rumsey.

Forest Preserves and Game Refuges are also considered. Aside from the surpassing interest of the narratives, the book is invaluable for referenc. Cloth, heavy paper, library edition, richly illustrated.

Postpaid, $2.50

Where, When and How to Catch Fish on the East Coast of Florida

By Wm. H. Gregg, of St. Louis, Mo., assisted by Capt. John Gardner, of Ponce Park, Mosquito Inlet, Fla. With 100 engravings and 12 colored illustrations. Cloth. Illustrated. 238 pages. Map. Price, $4.00.

A visitor to Florida can hardly make the trip without this book, if he is at all interested in angling. It gives a very complete list of the fishes of the East Coast of Florida, and every species is illustrated by a cut taken from the best authorities. The cuts are thus of the most value to the angler who desires to identify the fish he takes, while the colored plates of the tropical fish shown in all their wonderful gorgeousness of coloring, are very beautiful. Besides the pictures of fish, there are cuts showing portions of the fishing tackle, which the author uses. A good index completes the volume.

A WEEKLY JOURNAL.
Copyright, 1911, by Forest and Stream Publishing Co.
GEORGE BIRD GRINNELL, President,
CHARLES B. REYNOLDS, Secretary,
LOUIS DEAN SPEIR, Treasurer,
127 Franklin Street, New York.

THE OBJECT OF THIS JOURNAL will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects.

—FOREST AND STREAM, Aug. 14, 1873.

WHAT OF THE WOODCOCK'S RANGE?

An important question comes up. Must the naturalists change their records with regard to the woodcock? Are we justified in averring that westward the wily woodcock wends his wandering way? Or must we declare that we are men from Missouri and believe that these people who report the woodcock west of the Rocky Mountains—and even on the very shores of the Pacific Ocean—have been mistaken, and demand from them an authenticated specimen of the bird taken on that coast?

The three men who have reported the woodcock from beyond the Rocky Mountains are men of mature years—men who know the woodcock and are not likely to be led away by enthusiasm. One of them, Mr. Belknap, had the birds in his hand in Washington—then a territory; another, Mr. Parker, was very close to the bird; while the third, Mr. Leach, reports a California specimen, not of his own knowledge, but on the authority of a man whom he refers to as a naturalist. Are they all mistaken?

While these reports seem to make it very probable that the woodcock has been observed on the Pacific slope, certainty can be had only by the production of a specimen authenticated as from that region.

In the case of at least one of the grouse, there is every reason to believe that the species has spread westward, following the cultivation of the soil; but this fact has little or no bearing on the distribution of a bird like the woodcock so far from its usual range. On the other hand it must be remembered that the woodcock is secretive and mysterious in its habits, and extremely likely to be overlooked in a country not at all settled or very sparsely inhabited.

In view of the interest awakened, it is probable that the question at issue will be settled during the coming season.

THE ten-thousand-acre forest reserve in Somerset and Westmoreland counties, in Pennsylvania, has been named after Governor Stuart of that State. In paying this compliment to the Governor, the State Forestry Commission had in mind the interest he has taken in conservation. The great tract is an important one, for it covers part of the headwaters of the Ohio River. It was acquired by the State through appropriations.

THE WEEKS BILL.

BEFORE this issue of FOREST AND STREAM reaches its readers, the United States Senate will have voted on the Weeks Appalachian Forest Preserve bill. The situation in Washington on the eve of taking this vote is described by our Washington correspondent in another column.

Up to the present time all the great national reservations have been located in the West, and the citizen of the Eastern or Southern States who wishes to go to one of these recreation centers must make a long journey to reach it. It seems only reasonable and fair that now Congress should provide for the citizens of the Eastern States great reservations nearer to their homes.

Reservations in the Appalachians and in the White Mountains will provide refuges where many of our game animals and birds may live unmolested. The establishment of such refuges for the wild creatures have long been called for by the best sportsmen.

Most practical, however, and most important from the economic standpoint is the increase in stream flow which would follow the establishment of these reservations.

The bill is reported likely to pass the Senate, the only danger being that it may be blocked by amendments which would send it to conference committee.

TO SAVE THE FUR SEAL.

THE progressive decrease in numbers of the fur seals of the Bering Sea has long been a cause of anxiety to all who are interested in the preservation of notable or useful forms of animal life.

For many years the chief cause of this diminution of seal life has been the slaughter at sea of the female seals by vessels manned by subjects of the United States, Great Britain and Japan. These female seals while nursing their young are obliged to make journeys of sixty or seventy miles for food, and on these journeys many of them are killed by the sealers, and their pups, deprived of food by the death of the mothers, perish of starvation. The drain on the seal herd is, therefore, chiefly on the female seals, and has caused a terrible reduction in the breeding stock. It is as if a farmer should kill his cows, his ewes or his hens to sell to the butcher. The result of such a destruction cannot be doubtful. The seal herds will be more and more reduced, until finally they will become so small that it will not be worth the while of the sealers to fit out vessels to take them. Thus, while absolute extinction will not take place so long as the breeding grounds are protected, the economic value of the herds will be destroyed.

For twenty years or more the United States, which has a large financial interest at stake, has been endeavoring to come to an agreement with the maritime powers interested by which pelagic sealing shall be put an end to, and it is just announced from Washington that an agreement has practically been reached between the United States, Great Britain, Russia and Japan for the preservation of the seal herds of the Bering Sea.

The details of the arrangement have not as yet been made public, but it may be inferred that one of its provisions is the prohibition by the powers named of pelagic sealing. Some equitable arrangement may surely be reached by which the powers that do not own seal islands shall unite with those owning them to prohibit oceanic sealing and to enforce the prohibition.

It is reported that the State Department is considering the question of calling an international conference to discuss measures for the protection of the seal herds. There are a number of seal rookeries in the southern hemisphere, and there is no reason why these herds should not be considered in such a conference as well as those of the Bering Sea.

NEW JERSEY FISH AND GAME.

THE State of New Jersey is to be congratulated on the good judgment shown by its board of fish and game commissioners in securing expert information on past legislation in New Jersey and suggestions for future laws for submission to the Legislature. The board secured the services of Charles E. Brewster, of the Biological Survey of Washington, and his report is referred to on another page.

The historical part of the report, which gives a list of the acts bearing on fish and game from early colonial days down to the present time, is exceedingly interesting, but much more practical are the present day suggestions which are given.

In his letter of transmittal, Mr. Brewster points out that the State of Maine has demonstrated the value of its fish and game from the financial point of view by being able to show through its commission that more than $17,000,000 is each year received by the people of Maine for the game and fish taken in that State. Maine has long stood in the forefront of the battle for protection, while the State of New Jersey has been slow to avail itself of this great asset. It is remembered that in New Jersey the heath hen lingered longer than elsewhere in the East, except in the island home in Massachusetts where a few birds still remain. Even living men can recall when heath hens used to be killed in some of the counties of New Jersey.

In all the Union no State possesses greater natural advantages for game preservation than New Jersey, and it is quite time that the State authorities took measures to nurture and cultivate the valuable crop that can be raised within its borders.

Game protectors everywhere will do well to secure a copy of this report, and the board, we are sure, will be glad to give it as wide currency as possible.

THE SPORTSMAN TOURIST

In Wooden Nutmeg Land

I.—With Woodcock, Quail and Ruffed Grouse in Connecticut Covers—A Shooting Story of By-Gone Years

By L. DAWSON

THE present scarcity of game birds in New England, and indeed everywhere in the Eastern States, is a natural sequence of the constant increase of population, and the resulting increase of the number of people who carry guns. Birds are few and gunners many, and the seasons during which shooting is permitted are longer than they should be. Besides this, the game birds are to some extent destroyed by vermin, and in the breeding season are disturbed and kept from breeding by some domestic animals. The house cat and the farmer's wandering dog are very destructive of game birds in our thickly settled States.

A generation ago this was not nearly so much the case. In those days a man who knew the ground, and was willing to go back a few miles from railroads and other lines of travel, could get fair shooting. Nothing, to be sure, like what the men of the preceding generation had had, but shooting that would rejoice the heart of the gunner of to-day.

Every autumn not so very many years ago, in company with a brother and a friend, I used to have excellent shooting among the wooded hills and tangled swamps of Connecticut in covers drained by the Housatonic River. We three knew well the ground over which we shot. We were accustomed to each others' ways and we had good dogs. We made these trips two or three times each season and usually were gone two or three days. My brother and I would leave our country home near the shores of the Sound and drive north a dozen miles to the town where Joe lived. Usually we started about 2 o'clock in the morning, carrying guns, dogs and bags in the wagon, and reached Joe's house some time before daylight. There, breakfast was ready, and before the dawn had broken we had shifted our loads to his wagon and were on our way north.

A very few miles brought us to ground where birds were usually found. After carefully working out a piece of cover we returned to the wagon and went on to the next piece. We timed ourselves so as to reach the home of some farmer known to us about dark, and putting the team in his barn enjoyed his excellent food and soon lay down to rest our weary bones. The cordial hospitality of these farmer friends never failed us, and each season it was a joy to meet them again to learn the events of their lives during the year, and to tell them the story of the day's experiences.

It is of one of those days that I should like to tell you. My brother and I had left the house about the usual time. For the first two or three miles the driving was slow, for in order to make a cut-off we had to go through shaded wood roads, one or two of which led through swamps where it was impossible to hurry. At last, however, we came out on to the broad and smooth turnpike and rattled along at a good rate of speed. Sometimes we sang over a mile or two of road, and then tiring of that, lighted our pipes and talked. The air was sharp and frosty, yet hardly cold, and the dogs at our feet felt warm and comfortable. The moon had set as we turned up the little hill on top of which Joe's house stood, and seeing the lights in the window we whooped to let him know that we were coming. In a few moments he had met us, and we took the horses out of the wagon and put them in the barn, leaving the dogs chained there. Then followed the delicious breakfast, and soon we were seated in Joe's wagon and on our way.

As a rule we took with us only a dog apiece. My brother had his old black Rex, a lumbering brute of great power and possessing a marvelous nose. I had old True, the best partridge dog I ever saw; light, active and tireless, and peculiar in that he never expressed any affection —so far as I knew—for any living thing. He would wag his tail a little and respond to a caress, but never fawned on one. If you put him into a wagon or railroad train or his kennel, he curled up and put his tail over his nose and went to sleep. The only thing he really cared for was to hunt. This morning Joe had taken with him his old dog, an animal that was snow white except for his eyes, which were dark brown; and a well grown pup, also white, but with one lemon ear.

The first cover that we beat was a small swamp hole standing in a flat meadow between a large stream and a rocky wooded ridge which ran north and south. The patch held only a few acres, and anything driven from it would necessarily fly across the meadow and give a clear shot. Joe, who though he weighed 230 pounds, was an indefatigable walker, marshaled his forces for the attack, for he was a great hand to organize. He sent my brother to follow the edge of the swamp on the side of the ridge and told me to take the other edge toward the stream. Then he plunged into the middle of the swamp with his dogs, while we kept around the edges a little ahead of him, and keeping our dogs as close to us as possible. We had not gone very far when we all heard a partridge get up apparently in front of Joe, and almost at the same time heard his gun and the shout, "Mark, mark!" I could see nothing, but a moment later my brother's gun rang out, and from the talk to his dog it was evident that he had killed his bird as Joe had his.

No one of the gunners could see the other, but after a few words we located each other, and Joe went on. For a little while nothing happened, and then I heard Joe talking to his dog and knew that the animal was making game. A moment later, with no warning whatever, a big red woodcock flipped out from among the trees and tried to cross me to reach the underbrush that grew along the stream. It was an easy and open shot. The bird dropped at once, old True trotted forward, paused on point and then picked up the woodcock and brought it to me, dropping it at my feet.

The swamp hole that we had beaten out, though so small, had yet yielded us two partridges and a woodcock, and the morning was still very young. As we came together in the meadow and then started toward the stream which above here was bordered on both sides with heavy undergrowth and young trees, Joe commented on this, saying: "Well, boys, if we find birds like this all day and kill them like this, we will have a big bag by night."

Reaching the next patch of brush we separated, Joe to go through the midst of it with his two dogs, my brother to keep on the outside close to the river bank, while I took the other edge to cut off any birds that might strike for the high rocky ridge. Joe had hardly made more than a few steps into the brush when his young dog started a partridge which, flying straight up into the air, was shot at by my brother, but not killed, and then turning, flew uncertainly across toward the timbered ridge and gave me a very simple shot, so that I got the bird.

And now for some time we moved along up the river valley without starting anything, but about the middle of the morning, as I was going through some open woods, within sight of Joe, who was a gun shot and a half on my right, I saw a woodcock that had evidently been passed over by his dogs, rise silently and flying low, cross over and alight in front of me and a little to the left behind where my dog was working. The bird alighted on ground that was almost bare, ran a few steps, stopped, stood as if listening, and then crouched close to the ground. Of

"AND SPRING COMES SLOWLY UP THIS WAY."—Coleridge.

From a photograph by Perry D. Frazer.

course I saw precisely where it was and did not dare to take my eyes from it, because I wanted to see it on the ground, something that up to that time I had very seldom done; for the opportunity to see a woodcock on the ground does not come often. Keeping my eye fixed on the spot I stole toward the bird as silently as might be, all idea of shooting being quite forgotten in my eagerness for the new sensation. I succeeded in getting within six or seven paces of the bird, apparently without being detected, and had an excellent view of it. This did not last long, however, for presently I heard my dog, which had missed me, come trotting back to look me up. He passed within two or three yards of the woodcock, which did not move, but a moment later the scent of the crouching bird reached his nostrils and he whirled on a stiff point. I knew that this was the end of my observations on this woodcock, and stepping forward, reached the dog's head. As I passed him he drew on three feet further, and a moment later the woodcock sprang into the air, and though I was quite ready to shoot, it whirled around a neighboring tree trunk, put it between me and itself with as much judgment as an old cock partridge could have used, and by the time it was again in sight was quite out of gun shot.

Joe, who had heard the woodcock get up, called across to me: "Why didn't you shoot?" And I could only call back that the bird had been too smart for me. A little later a woodcock got up in front of Joe, who killed it, at the same time cutting off a good sized branch of a red maple, and soon after that another bird rose close to the river bank and started to fly across, which my brother killed and old Rex retrieved in his usual good style.

Beyond the cover that we had been beating out was a good sized rye stubble that we were to work. We sat down on the edge of the field to count and smooth out our birds and to smoke a pipe or two. The weather was beautiful, one of the late October days when the sun is warm, the air full of fragrance and the haze that hangs over field and wood lends a dreamy aspect to all the more distant features of the landscape.

"Well," said Joe, "this isn't so bad; three woodcock and three old 'pats,' and noon quite a long way off yet. Now, I am told that there is one good bevy of quail in this rye stubble, and maybe two, and I think that we ought to be able to get some of them before noon. If we can find them and can get them scattered, we can get what we want. We don't want to kill them all; better leave a plenty for seed for the next crop."

It was not more than 11 o'clock when we entered the field and walked down through it, the four dogs covering the whole stubble and its borders. We had not gone far before the dogs began to make game, casting about rather confusedly and as I thought working on trails made quite early in the morning. A little later, however, True, who was galloping slowly along near the fence, whirled on a stiff point, which, however, he almost immediately broke, and then began to road, but very slowly and cautiously. Rex had backed at True's first stop, but now hurried along as if desiring to overtake the red dog and steal the point from him. His master checked him and he grudgingly fell back. I called to my brother saying: "The birds are running and if they cross the fence before rising, we may fail to get a shot. Better call Joe over, and I'll cross the fence to try and catch them if they go into the woods."

Before I had climbed the rail fence I could see Joe approaching, having whistled his dogs over toward where we were, and a moment later —just how it was I could not see, because of the fence and the underbrush that grew along it—a big bevy of quail rose ahead of the men and flew on down the field, a single one of the birds turning and crossing ahead of me. Joe and my brother fired each two barrels, but I could not see what they did. I shot at the crossing bird and saw some feathers come back, but he went on very strong.

Going to the fence I called over to them that I should go into the woods to try to find the wounded bird, and I saw their dogs bringing some birds to them, but could not see how many. Joe called back that the birds had gone over into a swamp where it was better not to follow them at the moment, and that they would wait for me to come back at the lower end of the field.

The wood where I entered was quite open and free from undergrowth, but there were ferns and some low shrubbery, and I felt by no means sure that True would find the quail. We went on slowly for perhaps a hundred yards and then I saw the old dog feeling for a scent, and a moment later following it up, and presently he picked up the bird and brought it to me. I then started back to join my companions.

"Well, Joe," I said, "how many did you men get out of that big bunch that I heard rise?"

"Only three," said my brother, answering me. "Joe got a double, but somehow I managed to miss with my first barrel. Did you get yours?"

"Yes," I replied. "True found it almost at once and brought it to me. It fell dead. Where did the bevy go?"

"Over there in that thick swamp," said Joe, "and I don't think it worth our while to go in there after them. I believe if we go on and work some of these other covers we can come back here about 3 o'clock and we will find the birds out again feeding on the stubble. It seems to me a long time since breakfast," he went on. "Now, let's go over to Harley Warner's and get him to give us some dinner. I bet he's got some new cider, and we can sit by the barrel and drink all we want through the bung-hole with snellidge stalks."

"Good for you, Joe," said my brother; "we couldn't do anything that would suit me better," so with guns on shoulders and dogs following at heel, we started for the highway near at hand to walk a few hundred yards to Mr. Warner's house. Instead of going around and entering the yard about the house by the front gate, we crossed the fence going through a field to enter the yard by the back gate. My brother and I climbed the fence pretty nearly together while Joe, who was big and heavy, stepped along to look for an easy place to cross, but as my brother and I jumped off the fence into the low briers and bushes that grew close to it, a whistling woodcock darted up from the ground, twisted through the brush and flew out across the road just behind Joe, who very neatly killed it. A few moments later we were shaking hands with Harley and his wife, both of whom received us with the warmest hospitality. They were old friends of Joe's, but we had been known to them for two or three years. Joe's introduction and such intercourse as we had had with them had apparently won for us both warm places in their hearts. Mrs. Warner gave us a splendid farmer's dinner, and after we had eaten, we sat lazily around one of the big barrels in the woodshed and drank sweet cider made only a day or two before. Finally Joe, almost with blows, drove us from our revel, and we reluctantly parted from our host and hostess and dragged our loitering legs toward the game cover.

"Now, boys," said Joe, "let's cross over and go down the other side of the field where we started those quail and see if we can find the other bevy that lives there. Harley says he's sure they are there and that we ought to get them."

A short walk brought us to the upper end of the rye stubble and we crossed it and followed the fence down on the side furthest from the highway. Before we had gone very far, old Rex, who was working ahead began to road, but before he had made anything out of it, Joe's white puppy, the dog closest to the fence, whirled on point by a bunch of high weeds and the old dog backed him.

"Come on, boys," sang out Joe, and my brother hurried in toward the fence, while I, who had been working down outside of the lot, stepped forward to be ready for any birds that might cross through the underbrush that grew along the fence to my side. Joe as usual told each of us where to place himself, and I whistled True to come in.

"Now," said Joe, "if you're all ready I'll step forward and flush them." He advanced to do so and the young dog, much excited, crept forward two or three steps, stiff-legged, walking as if the ground were covered with eggs.

"Look out, now," was the last word from Joe, and a moment later the rattle of a great bevy of rising quail was heard. Half a dozen of them whirled over the fence to my side, and I got the first one, and then turned a little to try to double on two that seemed to be about to cross each other. I do not know whether I waited too long or shot too soon, but at all events only one of them came down. Shots from the other side of the field told me that my companions were busy and presently I could hear them talking to the dogs as they gathered their birds. I had marked my two down, one of them close to a little bunch of weeds in an open lot, the other a little further on under a young ash tree in a cross fence. True found them both, the second one only after a little search, and brought them in in his usual good style.

The remaining birds that had crossed over to my side of the fence had kept on down it, and I had not been able to see where they alighted.

Presently Joe called across, asking me what I had done, and when I put the same question to him he told me that four birds had fallen on his side of the fence.

"The rest of the bevy," he continued, "flew down to that piece of bare hillside beyond the field and lit there in the short grass. We can go down there and have some lovely shots at them; there must be a dozen down in that grass, and we can kill four or five more without doing too much. That was one of the biggest bevies I've seen for a long time. I believe there were twenty-five or thirty birds in it."

"Six or seven came across to this side." I answered, "and all except those I killed turned and went along the fence."

"Well," said Joe, "let's keep along just as we're going, and when we get to the end of this stubble we'll go straight across to where I marked the quail and see if we can find them. If the dogs do point them, we'll see something pretty."

Nothing especial happened until we had nearly reached the end of the stubble when True and I, who were still outside of the field, managed between us to put up and kill a woodcock. I had missed the dog and when whistling would not bring him, went back a short distance in search of him and found him pointing close to a little clump of brush in the wet meadows. The woodcock hopped up as soon as I kicked the edge of the brush, and gave one of those simple open shots which always make a man ashamed after he has killed the bird.

"There," said Joe, as we came together at the end of the stubble, and he pointed with his hand to a bare hillside, yellow with dried grass about a foot high, "there is where those quail went down, and there we ought to find them. There is not air enough stirring to make it worth while to go around them and try to work up the wind. If there were a little breeze I would like to do that. We've all heard the story about quail holding their scent, but I never have seen any positive evidence about it. Of course there have been times when I have thought I had marked down quail and then gone to the place with the dogs and been unable to find them, though later I have come across them very close to the spot, but now I am positive that these birds, or most of them, alighted in this grass and certainly the dogs ought to find them. Let us start in and try. One thing we must remember, though, that we should not kill more than six of these; that will leave one-half the bevy for another time."

Spreading out so as to cover almost the whole of the width of this patch of grass, we started to walk through it slowly, trying to keep the dogs from running over it too hastily, for I think most of us were a little doubtful as to whether they could smell the birds. However, it proved that there was no difficulty about this. Hardly had we started when Joe's old dog, which had made a cast toward the middle of the lot, bringing him in front of my brother, suddenly slowed up and stopped. The puppy, which was not far behind the old dog, backed him beautifully. Old black Rex, lumbering along a little to one side, stopped in his stride and backed, while True, who had been crossing over from my front, also backed. Here then were four dogs pointing and backing, the two white ones facing west, and the black and the red one facing east.

It was a beautiful sight and we all gathered to watch it; to admire the positions assumed by the dogs and to comment on their attitudes and the expressions of their faces. After our curiosity was satisfied, Joe asked my brother to step forward and kill the bird, and he advanced to flush it. A moment of stamping around before the old white dog seemed to show that the quail was not there. Then the old dog took a few steps forward and froze again, and as the old dog advanced, the young one teetered after him with extreme caution. Meantime Rex on the other side had crept up a little nearer, but good old True refused to stir out of his tracks.

At last the bird was tramped out from its hiding place, and flew low straight away to be deliberately killed at about thirty-five yards. Joe's old dog, who was entitled to that pleasure, was sent forward to retrieve it, but on his way back with the quail in his mouth he suddenly stopped and pointed.

"What," said my brother, "has he got another bird and is he pointing it with that one in his mouth?" Joe said, "It looks like it, doesn't it?" At that moment I saw what explained the old dog's point which, in fact, was not a point, but a back. The puppy, after being ordered to charge when the old dog went out for the bird, had taken advantage of the concentration of our attention on the dead bird and its bearer, sneaked off a little to one side and had come upon another quail and was pointing it. The old dog was backing him with the bird in its mouth, and True and Rex raised on their haunches were also backing.

We exclaimed with interest at the unusual sight and Joe threatened the puppy with dire punishment the next time he found him failing to obey orders. Now, however, there was nothing to do but to kill this bird, and Joe moved forward to do so while we others also drew up as nominal supports, though when Joe leveled his gun there was usually no need of support. When the quail got up, as it presently did, Joe killed it, and the puppy was sent to retrieve it, both birds being finally brought to pocket without further incident.

We now went on and in a very few minutes three more birds were pointed, two by True and one by Rex, and all were secured. It was the simplest, easiest kind of shooting with nothing to interfere and time enough for the most deliberate of shooters; in fact, it was so easy as hardly to be sport, and after the retrieving of the fifth quail I suggested to Joe that we leave these fellows and go after the other bevy. Moreover, it was now well on to the middle of the afternoon, and we had a good way to go to reach our team.

"You're right; let us leave these quail and go back to the stubble and see if we can find the other bunch, but you don't suppose," Joe continued, "that we are going to walk back to the team to-night. Not much. I told Harley before we left the house to have his boy go down to where we left the team and drive it up and put it in his barn. We'll stop with him to-night if you say so." And both my brother and I said "So" in a loud tone of voice.

Walking about over ground that we had not worked over, but that had been in our view for most of the day, we approached the edge of the thick swamp in which the first bevy of quail had taken refuge. It was getting toward evening, the sky had clouded over, and there was not much time left for shooting. We all believed that at feeding time the quail would come out of the swamp and go back to the rye stubble, and that by keeping close to the edge of the underbrush the dogs would find the trail and lead us to the bevy. In part, this worked out very well. Old True, who happened to be ahead of the other dogs, struck a trail which seemed to be quite fresh, for he followed it slowly, seldom putting his nose to the ground, but for the most part walking majestically along. Evidently the birds had passed out of the cover not very long before, and we were likely to come up with them and all to have a shot on the rise.

It did not turn out quite in this way. The trail led to a fence along which grew young trees and brush to a height of a dozen or fifteen feet, with only here and there a clear opening through which one could see. True had almost reached the fence and Joe and my brother, on either hand, were just about to look for places to break through it, when out in the lot on the other side of the fence I heard the bevy rise. Try as I would, I could see nothing of the flying birds, and my companions had no better fortune. I could not even see in which direction they had gone, but Joe, through an opening in the trees, thought he had seen one or two birds flying on across the field. It seemed useless to follow them, and turning back toward the house, we reached Harley's comfortable home just as dusk was falling.

After we had put our empty guns in the house we went to the barn and arranged comfortable quarters for the dogs, which we fed, watered and chained up to sleep all night on beds of warm soft hay. Then we repaired to the farmhouse kitchen, and after a short session at the pump with a bar of yellow soap and a rough towel, we went into the living room and took comfortable chairs about a big wood fire. There, until an hour later, when Mrs. Warner called us to a supper that has not yet been forgotten, Joe and Harley discussed politics, abused life in the big city, told of crops, past, present and to come, and had a real good time.

My brother and I, warmed by the glow of the fire and soothed by the murmuring voices, grew sleepier and sleepier, until finally, starting from a doze, I looked across at him and saw his head in such an absurd position that it woke me up. I rose, shook myself, and from then until the call for supper, tried to keep awake and to be interested.

[TO BE CONTINUED.]

The Curlew.

On the lone, lone marshlands,
By the bourn of the sea.
Where the wind-blown sands
Drift incessantly,
Shrills the curlew—a shy recluse

By the dunes, and the wastes,
His home is solitude;
Which the tempest desolates,
While the weird interlude,
Curlew! persists without a truce.

His plaintive cry is heard
With the sea mew's scream;
When the storm gust is stirr'd
And the day dies with a gleam
In the west, red with an angry flush.

Wings he spreads, which express
The sense of easeful flight;
Graceful are they, no less—
To bear him swift and light,
When he sweeps down the wind with a rush.

Free, free, the curlew flies!
Freedom is all his right;
While Curlew! Curlew! he cries,
Piping by day and by night,
And at morn with its rosy blush.

NATURAL HISTORY

Feeding Habits of Coots and Ducks.

Concluded from page 212.

There is, of course, no question about the coot's ability to swim well. This they do quite as well and as gracefully as most ducks. They are also very noisy, keeping up their calls and conversations during all hours of the day and night. And, contrary to some observers, the coot is a very expert diver. Not only will it dive when wounded, to get away from its pursuer, but it dives regularly and habitually while feeding, and with the greatest ease and grace.

Watching them from the cottage piazza with a good pair of field glasses was an extremely fascinating pastime. They always fed most industriously when the surface of the water was smooth and when the air was balmy. They also fed actively on calm, moonlit nights.

I soon discovered that they were feeding upon the wild celery, but at first was not sure what part of the plant they ate. I had read in the botanies and the ornithologies that the great delicacy of the flesh of the canvasback duck is due to its feeding upon "the roots" or the "leaves" of the wild celery. If a brisk breeze should spring up after the coots had been feeding diligently for a few hours or a day or two, a great quantity of wild celery plants was washed up on the lee shore. On examining these plants, I was not able to discover that the roots or leaves of many of them had been removed. Nearly all of the plants seemed intact and perfect so far as these parts were concerned. But one interesting and curious part of the plant I was never able to find on any of those washed up on the shore. This is the modified stolon or so-called winter bud, which many, perhaps all, of the *Vallisneria* plants form in the late summer. This is a short stem about the size of a lead pencil, one-half to two inches long, somewhat enlarged at the distal end, white in color, very crisp and tender, and with quite a pleasant taste.

We soon found that it was upon these winter buds that the coots were feeding, apparently exclusively, and I have no doubt that during the early fall they constitute the principal food of the coots that frequent this lake.

Later in the fall, after the supply of winter buds became practically exhausted, the coots, bluebills, redheads and canvasbacks began eating the bases of the wild celery leaves, and apparently, as choice food became more and more scarce, they fed upon parts of this plant, and upon other plants, which they at first rejected.

The depth of water in which they obtained the wild celery varied from four to twenty-two feet. Early in the season they were disposed to feed in the more shallow water, but later they went to greater depths. So far as we were able to observe, every patch of wild celery in the lake became a feeding ground.

The coot dives with greater abruptness than any duck I have observed. The body turns very quickly and is usually in nearly a vertical position before it is entirely submerged. There is, of course, great irregularity in the frequency of their diving. The character of the weather, whether they are disturbed or not, the success of their dives, and the extent of their hunger, are factors determining the frequency. But ordinarily one dive follows another very quickly, so that, when watching a flock of a dozen or more, one or more individuals can be seen going under and one or more emerging at any moment.

Depth.—The maximum depth to which coots can descend I do not know, but I do know they reach bottom in at least twenty-five feet. In front of our cottage we had a buoy marking a twenty-five foot hole, and I have often seen coots close to this buoy, diving and bringing up food from the bottom. Usually, however, their choice feeding grounds are in depths between four and eighteen feet.

Time of Remaining Under Water.—The length of time the coots would remain under water varied a great deal, it probably being determined chiefly by the depth to which they had to go and the readiness with which acceptable food could be found. The longest time any individual was observed to remain under water was sixteen seconds, and the usual time in water four to ten feet deep was about nine seconds.

Lake Freezing Over.—About the middle of December the lake began to freeze over, and by the first of January only one or two open spaces or holes were left. On the second of January my assistant, Mr. H. Walton Clark, who remained at the lake all winter, and who is the best field naturalist I ever knew, went out on the ice to the largest of those open spaces, which he found pretty well filled with coots and ducks, and a good many sitting on the ice at the edge of the pool. Upon firing among them, instead of rising and flying away, they attempted to escape by running on the ice. This they could not do very well, so he ran in among them and caught with his hands three canvasback ducks, one ruddy duck and one coot.

There was no wind and the ice was very smooth, conditions which, Mr. Clark thinks, made it difficult for the birds to rise.

I can easily believe this to be true for I have seen a duck, which was merely able to walk slowly while on the ice, rise and fly when it reached the shore, where its feet would not slip. When the ice is very smooth, the ducks slide along in a most ludicrous and helpless manner. It had become suddenly very cold the preceding night, and these birds, sitting on the ice for some hours, had doubtless become benumbed and inactive, and this is probably one reason why they were not able to rise promptly when first disturbed.
